HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LXVIII, No. 1 Fort Atkinson, Wisconsin July 18, 1924

Believe, world's champion Brown Swiss cow, and champion of all breeds for cows over 12 years of age.

Left — GEORGE MINETTE, under whose care the record was made.

Right — **F. P. MINETTE**, Sauk Center, Minn., owner.

14-Year-Old Cow Makes World's Record
Milked with a De Laval

Again a cow milked with a De Laval Milker makes a world's record—probably the most remarkable of the many great records made by De Laval-milked cows. This record was made by *Believe,* a purebred Brown Swiss cow owned by F. P. Minette & Son, Sauk Center, Minn., who at the age of 13 years, 6 months and 5 days, started a yearly test and completed it by producing 25,847.8 lbs. of milk containing 1002.62 lbs. of butter-fat. This record not only makes *Believe the greatest producer of all Brown Swiss cows,* but also makes her the *champion producer of all breeds for cows over 12 years of age.*

Believe was milked during the entire period with a De Laval Milker, and George Minette, under whose care the record was made, says:

"We have been using a De Laval Milker for over two years, and it has given very good satisfaction. We have used it every day and have just finished several wonderful records, especially the one made by *Believe.* No doubt *Believe,* being a wonderful cow, would have made a good showing anyway. However it is only right that we give the De Laval Milker its credit."

There is no question but that a De Laval Milker, because of its uniform, gentle and stimulating action, helps cows produce more milk, as records such as this are constantly proving. You may not be interested in making big records, but you certainly want to produce more milk, of better quality, at less expense—and this a De Laval Milker will surely help you do. If you are milking ten or more cows by hand, you can soon pay for a De Laval. It is sold on such easy terms that you can use it while it is paying for itself.

SELECTING ANIMALS FOR THE DAIRY HERD

E. B. FITTS, Pennsylvania State College

IF money is to be made in dairying there must be quality in dairy cattle. This is fundamental to success. By quality, in this connection, we refer to working ability or power to convert feed into milk. The mission of dairy cattle, as is also the case with most other classes of farm live stock, is to convert or manufacture the rough, bulky crops of the farm into food for the human race. Dairy cattle are more efficient in this important work than are other classes of live stock and for this reason they are found on a majority of the farms of this country. As population becomes more dense the tendency will be more and more for dairy cattle to supplant other food producing animals.

While it is a fact that dairy cattle as a class are more efficient than other farm animals, yet we find great differences existing among them in ability to work for their owners. Dairymen should never lose sight of this important fact. Instances are very common where one cow will yield twice as much milk as will another kept under exactly the same conditions and eating the same kinds of feed. Entire herds equal in number, kept on adjoining farms, where the same opportunity exists, often vary 100 per cent or more in amount of milk produced. In other words, the milk check received by one farmer from creamery or milk plant will be twice that received by his neighbor and this difference may continue month after month and year after year. Inferior working ability in dairy cattle often brings disaster to the dairyman, no matter how carefully he feeds or how hard he works.

Successful or profitable dairying being dependent upon quality or working ability of the cows in the herd, skill in selecting animals becomes a matter of prime importance. The most successful dairymen are good judges of dairy cattle.

Selecting the Breed

The best herds, in fact nearly all profitable herds, are built up along breed lines. The person who chooses a breed and sticks to that one breed has a much greater opportunity for success than the one who changes from breed to breed. The dairy breeds have developed as a result of many years of careful work in selecting and breeding with the goal ever in mind of constant improvement in type and in efficiency. As a result the dairy breeds, Ayrshire, Brown Swiss, Holstein, Guernsey, and Jersey, or grades of these breeds, produce more milk for feed consumed than do cows of other breeds or cows of mixed breeding.

The first step then in selecting animals for the dairy herd is choosing the breed. Individual preference and the predominant breed in the community are factors to be considered. There is no best breed. Breeds differ it is true, and each perhaps excels all others in some one point but none is outstanding above the others in all points. The breeds with high testing milk are favorites in many communities where cream or butter are sold, while those yielding larger quantities of milk of a lower test are popular in market milk territory. If no particular preference exists, choose the breed that produces the quality of milk called for by the market at hand. It is, however, of advantage to unite with other dairymen in the community in the choice of a breed or to choose the breed already common in the community. Greater progress follows a community interest in a single breed and a more ready market develops for surplus cattle.

Selecting Individual Cows and Heifers

Breed selection alone is not sufficient to insure a good herd. The selection of individual animals within the breed is of equal or even greater importance. Inferior strains exist in all the dairy breeds which result in inferior animals appearing in pure-bred herds from time to time. The selection of individual cows within the breed or grades of the breed becomes, therefore, a vital matter. This is especially true if one is choosing foundation animals on which to build a herd. Years of time may be saved in developing a high producing herd of good breed type if one starts with good foundation animals. Type is very important and should always be carefully considered. This is especially true in case of pure-bred herds. By type we mean shape, form, adherence to breed lines, and adaptability to purpose for which kept.

Milking ability is an inherited character that, to be great or small, is a permanent part of a cow's make-up or existence. The only certain way of determining the milking ability or usefulness of a cow as a milk producer, is to keep a record of her actual milk production during an entire lactation period. This is accomplished only through weighing her milk daily or at stated intervals during the year. Estimates based on amount produced in one day or for short periods are usually far from accurate. Cow testing associations are in existence in dairy sections all over the country because of a general recognition of the great need of records of milk production of individual cows in the dairy herd. These associations are groups of dairymen who unite in hiring a man to visit the herd of each member once a month and to weigh and test the milk of each cow. At the close of the year authentic records are available showing the total milk production or actual working value of each cow. As a means of selection milk records point the way.

A cow must stand or fall on her ability to work. A cow having once demonstrated the ability to produce paying quantities of milk will possess this ability until disease, accident, or old age reduce her efficiency or remove her from the herd. She will in addition always have a strong tendency to transmit this same working ability to her offspring. On the other hand, the cow that fails to produce a satisfactory yield under favorable conditions will always be unsatisfactory and she in turn will pass her poor qualities on to her offspring. Shun this type of cow as you would a pestilence.

The man going out to buy cows will find, however, that the vast majority of cows have no dependable records of production and the purchaser must rely on other means of selection. Here is where the eye of the dairyman needs to be trained to recognize good and poor points. A good judge is skillful in seeing the outer indications of internal working ability and is able to select the workers with a fair degree of accuracy. He looks for size of

(Continued on page 22)

MR. C. L. HILL — MRS. C. L. HILL

THE HOME OF MR. AND MRS. CHARLES L. HILL AND WHERE THE WISCONSIN STATE DAIRYMEN'S PICNIC WAS HELD JUNE 18TH

The Hill farmstead is well planned and beautifully located. It is a genuine farm home and affords all opportunities for happiness and contentment.

WORLD'S RECORD FOR JR. 2-YEAR-OLD JERSEY

THE world's record in the Jersey junior two-year-old class has been broken by Raleigh's Torono's Meme. In 365 days she produced 902.15 pounds of fat and 16,085 pounds milk, starting test at two years, five months of age. Her record sheet shows that for eight months of the test she yielded in excess of seventy pounds fat per month, and that she reached the peak of production in the sixth month, when she produced 99.02 pounds fat. Her milk averaged 5.60 per cent fat for the year.

Meme is an excellent individual, well grown, strong and vigorous, with plenty of capacity and quality. She finished in splendid condition and at no time was she off her feed. Feeding was carefully taken care of, but no unusual ration was fed. The grain ration was prepared in advance and fed immediately before milking. Milking was done very regularly and Meme was usually found to be waiting at the door of her stall for the milker. Eighteen pounds of the following mixture were fed daily: 250 lbs. ground oats, 200 lbs. wheat bran, 150 lbs. oil meal, 50 lbs. cottonseed meal, 100 lbs. gluten feed, 100 lbs. hominy feed, 15 lbs. salt, and 8 lbs. mineral mixture.

This feed was mixed with wet beet pulp. About thirty-five pounds of silage was fed daily, and alfalfa hay was before her at all times, but she did not eat a great deal of it. Green corn and kale were fed in season.

With her record of 902.15 pounds fat, Meme displaces Pearly Exile St. Lambert, the Oregon cow which has held this junior two-year-old championship since the year 1910. The former champion's record was 816.10 pounds fat.

A glance at the pedigree of Raleigh's Torono's Meme shows that she has in her the blood of some of the most outstanding animals of the breed. Her sire is Raleigh's Torono, a silver medal bull with twenty-five daughters and four sons in the Register of Merit. He is by the well-known medal bull, Hood Farm Torono.

Her dam is Noble's Grace Loretta, a Register of Merit cow that is a great granddaughter of Loretta D, the cow which won the distinction of having been the "best cow of any breed" at the St. Louis Exposition, both in Class A, for demonstrating the economic production of fat and butter, and in Class B for demonstrating the economic production of milk for all purposes of dairying.

RALEIGH'S TORONO'S MEME, WORLD CHAMPION JUNIOR 2-YEAR-OLD JERSEY
Year's record: 16,085 lbs. milk, 902.15 lbs. fat.
OWNED BY SHERMAN NURSERY CO., IOWA

Raleigh's Torono's Meme is owned and was tested by the Sherman Nursery Co. of Iowa, Mr. E. M. Sherman, president. The herd is under the direct and capable supervision of Ross Smith.—The American Jersey Cattle Club.

LOANING BULLS

S. R. WINTERS, Washington, D. C.

THE use of a pure-bred bull in a herd of twenty cows and heifers was the only thing lacking in the dairy operations of J. L. Werts who lives on a farm near Powell, Wyoming. He is so fortunately located that a natural-gas pipe line passes through his farm, which he taps for gas in running engines that operate the milking machine, cream separator, and churn, and also for supplying heat in sterilizing milk bottles.

Now, thanks to a co-operative arrangement between the Reclamation Service of the United States Department of Interior and the Dairy Division of the United States Department of Agriculture, the services of a pure-bred Holstein-Friesian bull have been made available to Mr. Werts and a group of neighboring farmers. The latter, by names, include R. B. Stetler, Earl Murray, and E. V. Lewis, who own in the aggregate 44 head of dairy cattle.

A similar arrangement for the use of a pure-bred Holstein-Friesian bull has been made for another group of farmers on the Shoshone project (Montana) of the Reclamation Service. They are T. T. Williams, R. G. Anderson, Dr. Elmer Gould, and J. E. McPherson, who own a total of 44 head of dairy animals. Mr. Williams has agreed to assume personal charge of this pure-bred sire and the expenses of maintenance are to be shared by this group of farmers in proportion to the number of cows which each keeps.

The two yearling pure-bred Holstein-Friesian bulls thus loaned by the Dairy Division of the United States Department of Interior were obtained from the Huntley Experiment Farm in Montana. The Reclamation Service is not unmindful of the importance of this co-operative arrangement as can be noted from a statement of this government bureau, as follows: "The obtaining of these pure-bred bulls is a matter of much interest and importance to the Shoshone project and indicates the tendency among those engaged in the dairy industry to obtain pure-bred stock and to increase production. Already there have been applications made to obtain similar animals for other groups of farmers."

The stipulations governing the lease of these pure-bred sires to groups of farmers require of the latter observance of the following particulars:

1. To feed and care for the bull at their own expense, to mate the bull with only such members of the herd as shall be agreed upon by the farmers and the Department of Agriculture, and to mate the bull with outside animals only upon obtaining permission from the Department of Agriculture.

2. To keep the herd free from tuberculosis by having animals tested yearly by the Bureau of Animal Industry and by promptly removing or isolating all animals which react to the test.

3. To keep accurate milk records of all cows with which the bull is mated, to test the milk of each such mated cow monthly for butterfat, and to keep accurate records as to the dates of breeding and calving.

4. To retain all heifers in the herd until they have finished at least one lactation period unless the disposal of heifers otherwise is approved by the Department of Agriculture.

5. To keep accurate milk records of all daughters of the bull and to test the milk of each daughter monthly for butterfat.

6. To permit the Department of Agriculture, at any and all times, to inspect all breeding and production records kept by the members of each group.

7. To feed the bull properly, to use the highest degree of care in caring for the bull, and to return the bull to the Department of Agriculture at the termination of the agreement in as good condition as when obtained.

In addition it is understood between the farmers and the Department of Agriculture:

A. That the bull shall remain the property of the Department of Agriculture and shall be subject to removal upon one day's notice, in case the department considers that the objects of the work to be accomplished under the arrangement are not being attained or upon failure of the farmers to whom the bull is assigned, to fulfill conditions of agreement.

B. That all expenses for veterinary services necessary while the bull is in the custody of the groups of farmers shall be paid by them.

HOLSTEIN-FRIESIAN BULLS LOANED BY THE DAIRY DIVISION OF U. S. DEPT. OF AGRICULTURE TO GROUPS OF FARMERS IN WYOMING AND MONTANA

Effects of Feed

HOARD'S DAIRYMAN:—On page 203 of your issue of February 22nd and under the heading, "Is Feed the Cause", we note some comments of interest by Mr. Frank Laubner of Pennsylvania.

The statement that "the most cases of failure of cows to breed are to charge to a too narrow ration and a too heavy feeding of the feed mixture" is too positive and sweeping a statement to go unchallenged.

It is undoubtedly true that much trouble is being experienced in many herds where a narrow ration is fed, but the mere fact that the ration is high in protein may be a coincidence and not the real cause. A ration containing only 18 per cent to 20 per cent protein might be an endless cause of trouble while a 26 per cent ration properly compounded and rightly fed might keep a herd in normal health while still up to a maximum of economical production.

The writer has had something over 20 years with registered Holstein-Friesians and in that time has fed many combinations of feeds in narrow rations and in sufficient quantities to make some very creditable records, including more than one world's record. During this time no case of sterility has developed which could be traced directly to "a too narrow ration—and a too heavy feeding of the feed mixture". It is probable that many feeds low in protein are just as conducive to sterility as the best of our standard high protein dairy feeds. An animal's system may be seriously deranged by overfeeding of a very wide ration or a narrow ration may be fed with satisfactory results.

Many well known dairymen are feeding rations sadly deficient in some of the elements necessary for maximum milk production, especially from the standpoint of yearly production, although the protein may be far in excess of requirements. Assuming then, that many cows fail to reproduce as a result of the ration received, is it not possible or even probable that the fundamental cause may lie in a lack of some necessary substance or substances, or in an excess of some deleterious substance other than protein in the ration?

The writer has never advocated the forced feeding of dairy cows on an excessively narrow ration, but has, on the contrary, always believed in keeping the herd under conditions as nearly normal or natural as possible.

It seems advisable to consider all the factors before condemning the proteins in the dairy ration. Overfeeding with almost any kind of a ration, especially when cows are too closely confined, would tend to derange the animal system with sterility as one of the results that might ensue. Feed liberally of good corn silage and alfalfa or clover hay supplemented with a grain ration compounded from good feeds containing the necessary phosphorus, lime, etc., as well as the proteins, fats, and carbohydrates. If such a grain ration is intelligently fed and the herd in other respects kept under conditions as nearly as possible as nature intended, disorders, including sterility, will be reduced to a minimum.

Wisconsin. L. M. HATCH.

EVER FAILING OR NEVER FAILING PASTURE

Part 3.

What's Done when Bluegrass Fails

WILBER J. FRASER, University of Illinois

DAIRY farming in the different sections of the country must include a great variety of soils. On rich, high-priced land, such as is found in most of the Corn Belt, where dairying is only a side issue of grain farming, it does not pay to have much permanent pasture. Larger returns per acre can be secured from the clovers, alfalfa, or cultivated crops.

There are some areas which may be called "natural pasture land"—hilly places, land with out-cropping rocks, land cut by streams, badly eroded or partially covered with trees and bushes, and areas impossible to drain. So on the great majority of dairy farms, the part to be used for permanent pasture is already fixed by the fact that the land can not be used for anything else.

This type of land comprises 13.7 per cent of all farm land in the eastern half of the United States, while in the nine chief dairy states it makes up 16.3 per cent of all farm land. In some of the New England States there is even a greater percentage of the farm land which is untillable. For instance, Massachusetts has 27 per cent; Connecticut, 29.4 per cent; and New Hampshire and Vermont, 34.3 and 40.4 per cent respectively, as shown by the 1910 census.

Much and Costly Feeding

The dairymen in many dairy sections, seeing that bluegrass does not adequately supply their cows during the summer, have resorted to supplementary barn feeding. We have seen in a preceding chapter that the dairymen in northern Illinois have about one and a half acres of bluegrass per cow, and we know that supplementary feed is required for five out of the six summer months. This practice of barn feeding in the summer is so large and well established in that region that I found by asking 42 of these dairymen this spring, that they do not know what one means by "the barn feeding period", since it is practically barn feeding the year around with them, the only exception being for one month during the last half of May and the first half of June when bluegrass pasture is abundant. The feed most frequently given was corn silage; some fed hay and grain; and some fed all three of these when the pasture was very short. Many fed as much as 30 lbs. of silage per cow per day, and half as much grain and hay as they do in winter.

Thus it is seen that the best dairymen in that section are supplementing the bluegrass pasture with almost an entire ration of expensive feed for a large part of the summer. In addition to this, too large an amount of the grain feed given to the cows during this period is purchased. Grain at best is an expensive feed and purchased grain is usually more expensive than that which is home grown.

COWS PASTURING ON ALFALFA—AN ECONOMIC METHOD OF SUPPLEMENTING BLUEGRASS

One and One-half Acres Cultivated Crops Per Cow

According to the four years' test of bluegrass reported in the first article, and counting one and a half acres of bluegrass per cow, the herd would require to supplement pasture an average of 30 lbs. of silage, 8 lbs. of hay, and 10 lbs. of grain per cow per day for five out of the six summer months. This silage, including waste, would require two and a half tons, or a fourth of an acre of good corn, per cow. The hay would require one-third of an acre; the grain: corn and oats, 750 lbs. of each, or 14 bushels of corn and 23 bushels of oats per cow would require a third of an acre in corn and one-half of an acre in oats. Thus it would require one and a half acres per cow to produce the silage, hay, and grain needed to supplement blue grass pasture during the summer six months. For a herd of 20 cows this would take 30 acres of land and all the labor of raising the crops, threshing the oats, making the hay, filling the silo, husking the corn, grinding the grain, besides the work of feeding these rations—*one acre of cultivated crops would be required for every acre of bluegrass pasture, and much labor in addition.* This is expensive summer feeding, and the expense or loss is much worse with the many herds that are not given this extra feed. The result is that they go hungry, lose flesh, and fall off in their milk flow.

CORN SILAGE AND ALFALFA HAY

The most satisfactory and economical supplements to bluegrass when no other pasture is available.

From observations made in other states during mid-summer and from talking with men of wide observation and experience in these states, it is safe to say that the dairymen who are the best feeders in all dairy sections meet the shrinkage of pasture by barn feeding during the summer in much the same way as do the dairymen of northern Illinois.

Overlooking the Economic Problem

Thus, although they recognize the great shortage of bluegrass pasture, they have failed to realize that the most economic way to feed cows during the summer is to use some highly productive pasture crop.

It is just as necessary for financial success to *feed the cows economically as it is to feed them well.* So many consider the cow's taste and requirements with never a thought of how to supply them as cheaply as possible. Frequently, oil meal, cottonseed meal, or other high protein feeds are purchased to supply protein requirements that should be supplied by legume pasture. We do not purchase oranges and bananas during the summer when we can get something of the same sort and much cheaper and fresher out of our own orchard and garden.

Similarly, if a cow needs a ton of feed, and one way it costs $15 a ton, and the other way it costs $30, there should be no doubt as to how best to obtain it. The dairyman needs that $15 he could save by making the right choice here in his feeds just as much as the cow needs the feed. He feeds the cow to make money, and the profit may be twice as great when an economic system of feeding is used as when an uneconomic system is used, even though the production in one case may be no greater than in the other.

High Cost of Supplementary Feed Prohibits Bluegrass Pasture

The extensive practice of letting the cows go hungry, lose flesh, and shrink in their milk flow on the one hand, or of feeding them two-thirds as much in the barn through the summer as in winter at a heavy cost in cultivated crops, *means that the dairyman must practically give up bluegrass on all but untillable land.* One can not correctly call this bit of bluegrass in spring and fall—pasture! It is only a garnish around the edges of summer feeding—a sight and flavor of green grass more for scenic or suggestive effect than for nutrition.

Isn't there any kind of pasture crop which will pasture cows all summer? That is the problem and the dairyman's quest.

How can this shortage of bluegrass be made up the most economically? Evidently it should be by some other kind of pasture, to save the labor of growing, harvesting, and feeding supplementary crops; and it must be a deep rooting plant to withstand the drought that stops the growth of bluegrass, and should be a legume if possible. Alfalfa and the clovers are the deepest rooting legume pasture crops, and are therefore the first to be considered.

Alfalfa as a Pasture Crop

Many good dairymen have successfully pastured alfalfa after the first crop was cut for hay, just at the time when bluegrass pasture nearly always fails, with the only disadvantage of occasional cases of bloat. The University of Illinois sent an inquiry

FEEDING HUNGRY HEIFERS GREEN CORN ON SCANT BLUEGRASS PASTURE—A WASTEFUL AND UNSATISFACTORY METHOD OF FEEDING

PERMANENT BLUEGRASS PASTURE HAS A PLACE ON THIS STONY, UNTILLABLE LAND

New York Milk Situation

H. H. LYON, NEW YORK

THE recent developments in the New York Dairymen's League territory have caused much discussion, have brought to light some facts not well understood in a general way, and have caused in various quarters a certain amount of misunderstanding. Out of all this I am looking for some good to come ultimately. The much-heralded Committee of Fifteen has apparently come to naught, but I would be the last to discredit the effort. It has been the means of bringing facts to the open, which although not altogether recognized are nevertheless capable of recognition and will be examined more or less as the time goes on. Credit then to the effort to harmonize the groups of dairymen. We will hear more of this in the days to come or I am no good guesser.

Every farmer is talking about the unfortunate ending of the work of the committee on the 30th of June. Many pool members are solidly with the action of the League representatives on the committee. Some are rebellious, threaten to withdraw at the first opportunity and predict the downfall of the League when February comes. The anti-pool dairymen vary from despondency to belligerent anger, yet not knowing of a thing that they can actually do. I have been visiting from 15 to 30 of these dairy farmers of all shades of opinion almost daily for some time, both before the last meeting of the committee in June and since then. The reaction is interesting yet it tends to cause one to do much sober thinking. These dairymen are hard pressed by the present economic conditions and quite frequently they blame the League for the predicament in which they find themselves.

It will be remembered that at the annual meeting of the League, Vice-president Miller expressed the hope that if the Committee of Fifteen refused to work on fundamentals and insisted on price fixing that the three League representatives would immediately withdraw. This is exactly what happened. The League representatives (not that they were appointed to represent the League but acted because unofficial members asked them to act) early in the day suggested a plan and offered a resolution that a study be made of New York City milk markets and of the New York milk shed production, and also suggested that this survey be conducted under the direction of Dr. Warren of Cornell by means of the recent appropriation for study and teaching of marketing problems.

All through the day this resolution had some discussion. The opposition was not ready to turn it down rudely, but they were opposed to it and they had twelve votes against three organization votes. They finally introduced their resolution that the price of milk be $2.33 for the fluid market after early July, but they kept on discussing the other question. Late in the day they modestly voted to table the League plan. The chairman, a League man, immediately resigned his place which was then supplied by another from another group. The next question was the advance in price and the three League members withdrew stating their reason, after which the twelve adopted the price of $2.33. No one can blame them for advancing the price if they can and will. The vote was harmless, of course, for they cannot advance the price a penny. They wait on the League for that and economic conditions control the League.

Another meeting has been suggested for July 12th, I believe. I cannot see how these same League men can return and I know of no other real League men who under present conditions can act. Without the League there appears nothing that can be accomplished.

Meanwhile, other activities are in progress. A few new dealers are buying of the League entirely who before bought from pool and non-pool producers. One can readily see the difficulties of this course of buying. No matter which set got the best price, the others complained. First it was one way and then the other and it caused bother to the superintendent and in the office. One of these buyers had 1,200 pool patrons and 1,300 non-pool.

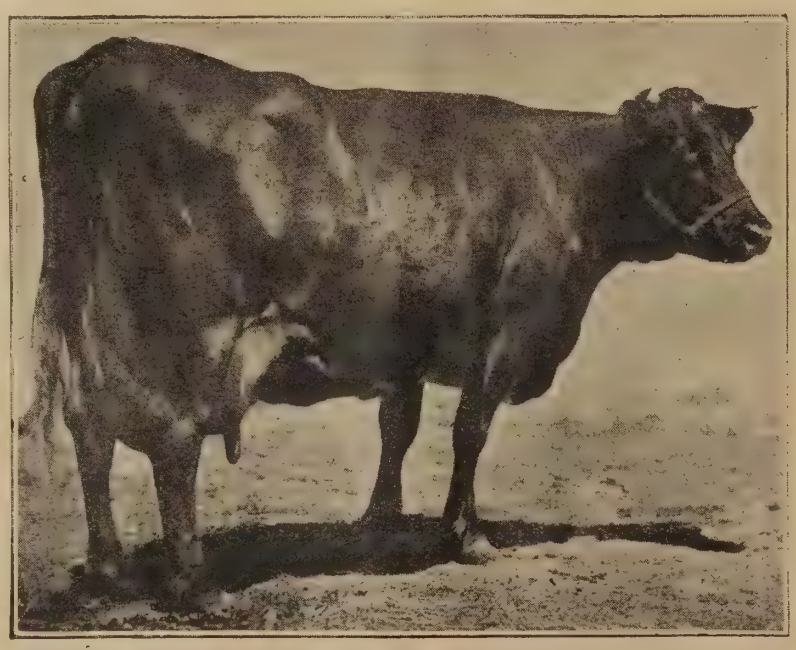
Also the League was able to divert from a competing non-pool buyer a hundred or more to the newly acquired pool buyer. The League works with its customers just as efficiently as does any business concern work with those who make that business go. This is real business method. We sometimes hear it charged that the Bordens are paying the League officers big graft just to keep the price of milk low. There is no reason for any such suspicion. The League does work with the Bordens in a way for they are friendly buyers but the Bordens do not control any action of the League so far as I can see except as to good business activities. The League directors desire to advance the price of milk but cannot do it with so large a surplus, so small demand, and with other dealers and producers cutting into the markets at an under price.

Whatever may be one's opinion of the non-pool association management, it is very evident to me that many of the anti-pool dairymen are as sincere as any other class. They do not see things as poolers do. I had a conversation with an anti-pooler lately. I do not think he is a member of the non-pool association although he did not say. If I got his real meaning, I believe he is just as honest in his belief as any one. He argues that there is no surplus of milk and no need of a contract in an organization, for if the League organization, for example, were honestly and efficiently handled it would be getting such good prices for its members that all farmers would be tumbling over themselves to get in. I think he believes it. He says that the old League did that for one year and that is the only year in the past ten in which he has made a cent. Since the present management got hold they have held prices down, ruined the farmers, and there can be no explanation except that they are paid to do it.

As we look at the situation, not all dairymen can be brought into one organization. Jealousies and misunderstandings are prominent. Many of these have come into being through the efforts of those who oppose co-operation, but they are here just the same. One milk dealer said to me today that it is impossible to make much out of an organization unless 90 per cent of the farmers belong. Even if 80 per cent will do, as some think, the task of getting them seems at this moment beyond a possibility. The Eastern States Association, through its individual member associations, has plants and can operate. If it should organize solidly so as to be an effective marketing association it would be in line to help work out the present difficult problems. There are many dairymen, some of whom own plants, who are not affiliated with any association. If they will join a good working organization or form one of their own that is solid enough to operate and in these ways 80 or 90 per cent of the dairymen can be really organized, they can perhaps work out some plan by which a board may direct sales.

Something of the sort is needed, but the League proposal to determine the basis upon which to work by an authentic investigation of markets and production, preferably under the direction of the state college as proposed, can hardly be overestimated as to importance.

As July and mid-summer weather advances, there is a possibility of increased demand for milk and its products. Flies are here and pastures are becoming shorter and drier. Farmers are not feeding quite as much grain as they have fed some years apparently. It may be that the League may be able to advance the price of fluid milk almost any time and I surely expect it to be done before these lines get into print. Butter and cheese prices seem to be slightly advancing and this if continued will tend to elevate fluid prices. We must all, poolers and "antis", come to see that marketing conditions have more to do with fluid milk prices than any organization, no matter how completely equipped, can arbitrarily have. So many seem to think that a price can be stated on paper and that settles it. No such thing is possible.



As stated, the twelve members of the committee representing four of the five groups voted the price of $2.33. In the case of these groups they immediately posted a price of $1.72 or less. In certain cases that I know $1.50 was at once posted for all milk regardless of test and that was by (in one case) a condensery where milk is supposed to average a test of about 3.4 per cent. A Limburger cheese factory, I am told, offered about $1.60 and no test. These are among the so-called independent groups. With $2.33 for fluid voted and $1.72 or less posted, the real sincerity and efficacy of the vote at once appears.

The pool price for May was, I believe, $1.40 for three per cent milk including certificate deductions or $1.30 in cash at the 201—210 mile zone. Many dealers, manufacturers, and, according to reports, some of the eastern states plants received less than $1.40. There were others such as the Sheffield producers who got more. Averaging it all I am rather of the opinion that the anti-pool producers must have received just about the same as the pool producers. I have met several farmers who say what is the use of an organization then if we get no more than without one. This is not a wise question but it is likewise not unusual. More careful thought shows that with no organization the whole price level would be lower.

It is easier to fill up the bed of a mountain torrent than to satisfy the heart of a man.—Chinese proverb.

A man may be strong, and yet not mow well.—Proverbs of England.

A New World's Champion Dairy Cow

"MELBA 15th of Darbalara, a Milking Shorthorn cow, has made on three milkings a day in 365 days an official record of 32,522 lbs. milk containing 1,614 lbs. butterfat. This exceeds any other record for butterfat made by any cow of any breed on any number of milkings a day in 365 days. It makes Melba the champion dairy cow of the world."—Milking Shorthorn Society.

In our June 6th issue, we published an article by Mr. R. M. Kinross who knows the breeding of Melba 15th, which reported her record for ten months, and that exceeded the world's yearly record. In the ten months Melba 15th produced 28,755 lbs. milk containing 1,399.35 lbs. fat.

Melba 15th of Darbalara is owned by the Scottish-Australia Investment Company of New South Wales. She is a descendant from the early importation of Bates Shorthorns which were bred for milk and were introduced into Australia many years ago. According to reports which have come to us from reliable authorities, no bulls in recent years, at least, have been imported from England into the herd of which Melba 15th is a member. The bulls have been selected from dams showing strong milking proclivities.

Cow Testing Associations

Association Notes by Testers

Southside, Va.: Three members installed boilers, two now shipping Grade A milk. One member built a new milk house with complete new equipment. One milking machine was installed and one herd tuberculin tested. The Powhatan Cheese Co., a co-operative plant in a bordering county, is now buying surplus milk from the largest dairy in Richmond, and has just established a truck route through part of this territory. Last year, the first year of operation, the company cleared a profit of 3c per pound of cheese and paid off all the outstanding notes held by the bank. It is now doubling its present capacity. Powhatan County has poor transportation facilities to any appreciable milk market and this co-operative cheese company was organized by the agricultural agent, L. E. Pettijohn. The success of this company promises well for dairying in this section, where it is just beginning to supersede other types of farming. Market milk sold for $3.93 fluid and $1.75 surplus (20% surplus). The cheese factory paid 42 cents per lb. for fat. —C. A. Buck.

Henrico Co., Va.: The 630 cows tested in June averaged 644 lbs. milk, 24.5 lbs. fat. During June 52 animals were purchased. One member entered 6 cows in the R. O. P. Another member has a new 60-cow, 2-story, grade A barn under construction. Excessive wind and rain have been destructive to hay crops and silos in this section.—S. Simpson.

McHenry Co., Ill.: The best herd in this association has just finished the year with an average production of 12,745 lbs. milk, 464.4 lbs. fat, an increase of 1,100 lbs. milk over the preceding year. The high cow produced 15,410 lbs. milk. Nineteen herds produced an average of over 30 lbs. fat per month. Market milk sold for $2.30 per cwt. in June and retailed for 12 cents per quart.—G. Hill.

Kane Co. No. 2, Ill.: The 572 cows in milk in June made an average of 885 lbs. milk, 30.4 lbs. fat; profit above feed cost, $15.72. Four purebred heifers and 15 grade and purebred Holstein cows were purchased in Jefferson Co., Wis. Julia, a 5-year-old grade Holstein owned by Oliver Pritchard, freshened December 28 and has made 11,537 lbs. milk, 460.7 lbs. fat since that time. She is high cow in the association in June. Market milk sold for $2.30 per cwt. and retailed for 10—13 cents per quart. —W. K. Bullock.

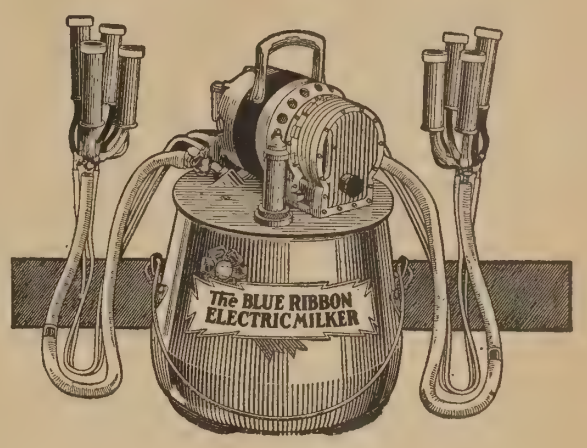
Ogle Co., Ill.: This association is much stronger than when it was organized two years ago. E. J. Brundage, Attorney General of Illinois, is the latest member to join with a herd of pure-bred Jerseys. Farmers are complaining of low price of milk. Rock River Farms' herd of 96 cows averaged 1,249 lbs. milk, 425 lbs. fat.

Traverse—Antrim, Mich.: Two stables were whitewashed, two new separators were installed, and two purebred Guernsey cows sold for $235 each. Twenty out of thirty members feed grain with pasture. Clarence Selkirk has the high cow in fat production for 9 months, 404.10 lbs. Creameries paid from 30—35 cents per pound for fat in June.—R. J. Kaiser.

Genesee No. 3, Mich.: This association finished its first month of the second year. Compared with a year ago, there is an increase of 110 lbs. milk, 2.8 lbs. fat for the month of June. Market milk sold for $1.75—$3.00 per cwt. in June. The creamery paid 39 cents per lb. for fat. Milk retailed for 13 cents per quart.—O. Wenger.

Branch Co., Mich.: This association finished its year's work last month. O. W. Butcher has high herd in fat production, his 14 cows averaging 8,737 lbs. milk, 404.24 lbs. fat. Average production of 223 cows in this association was 6,778 lbs. milk, 284.-02 lbs. fat. Nine herds averaged over 300 lbs. fat and 26 cows produced over 365 lbs. fat. Market milk sold for $2.50 per cwt. for milk; the condensery paid $1.30; the creamery, $2. —L. Q. Kitchen.

Rives—Jackson, Mich.: A few members are trying soy beans this year. Twenty-one samples of soil were tested for lime. Sixteen members feed grain on pasture. Six separators were tested. One separator was being run backward with a loss of $2.50 per cow per month. Four members keep daily milk records. Market milk sold for $2.10 per cwt.; the condensery paid $1.55—$1.60; the cheese factory, $1.50 flat for 3.5% milk.—J. Bird.



Plover—Marathon, Wis.: Two barns were whitewashed, 3 new silos purchased, one new barn is being built, one milking machine installed. The cheese factory paid 39 cents per

(Continued on page 11)

"If my Blue Ribbon Electric Milker were taken from me, I would quit dairying tomorrow"

From an unsolicited testimonial written by a successful Illinois dairyman. (Copy of letter on request.)

THIS dairy business man milks thirty-five cows three times a day. He had worked with a Blue Ribbon two years before he bought his own. Now, in his own words, he calls it his "Blue Ribbon Life Saver."

BLUE RIBBON ELECTRIC MILKER

marks the end of milking drudgery. It releases man-power for more productive work. It stabilizes the dairying industry and helps to place it on a firm business basis. Blue Ribbon Electric Milker is self-contained. The power plant is on the pail cover. The whole machine can be carried with one hand. No installation is required —it is plugged into any existing light socket like any household electrical device.

Economy is paramount because first cost is low, operation is low and maintenance expense is negligible. A working demonstration may be arranged by appointment. Write for full information, including new catalog.

The Cloverleaf Milker

Same principle of pulsation action, same "hit with the producer," but operated on the pipe line vacuum system. Where electricity is not available, either from central station or farm plant, Cloverleaf Milker is the mechanical hired man. Here's one piece of machinery which "keeps the boys on the farm."

$50.00

brings you the "Cow's Best Pal"

EDITORIAL COMMENT

HON. J. Q. Emery, Dairy and Food Commissioner of Wisconsin, advises us that in the year 1923 the production of creamery butter in Wisconsin was 147,550,611 lbs. which was 8,857,289 more pounds than was produced in 1921. The production of cheese was 343,303,157 or an increase of 44,570,188 lbs. over the production in 1921. The value of the cheese for the year 1923 was $77,431,700 and the value of creamery butter was $65,567,474, an increase of $24,424,652 on cheese over the year 1921 and of $8,565,622 on creamery butter over that of 1921.

WHY MORE LAND

President R. A. Pearson of the Iowa State College comprehends the fallacy of the government bringing more land under cultivation at the present time. He commends two editorials which appear in our issues of June 13th and 20th against developing more land under present agricultural conditions. President Pearson has upon several occasions spoken against the federal government's land policy and in a recent address said:

"Let the government take a vacation in respect to opening up more farm lands with the aid of great, expensive, irrigation enterprises. These developments are costing enormous amounts of money. Let us spend it in better ways to help agriculture. We sometimes boast of the wonderful dams, the largest of their kind in the world, which make possible the development of large areas of productive farm land. These improvements are of great benefit to persons who are engaged in promoting the enterprises and of great benefit to land speculators who sometimes make fortunes in dealing in the new lands and raising the prices until the lands are sold at high figures to bona fide farmers who must always carry a large overhead interest charge on values which have gone into the pockets of shrewd promoters and speculators. And then these farmers with the opportunity which has come to them through the munificence of the government become competitors in a field that is already well filled if not overcrowded and prices of agricultural products fall accordingly."

TO PRODUCE MORE FOR THEMSELVES

The Extension Division of the Virginia Polytechnic Institute has outlined a program for the purpose of encouraging the farmers in that state to produce more food and feed on their farms. It is the natural tendency among all people to specialize. The wheat farmer desires to raise little else than wheat, the cotton farmer cotton, and even our dairy farmers have a tendency to produce nothing but milk. There are instances perhaps when the farmer can devote himself to one crop and pay little or no attention to anything else. On the other hand, the single crop system, as a whole, has been one of the drawbacks to agriculture.

The Extension Department of Virginia in the month of April was successful in getting several thousand farmers to sign enrollment cards agreeing to do seven out of the ten following things:

1. To raise enough corn and hay to carry me one year without buying.
2. To raise enough meat to supply my family for one year.
3. To have a spring and fall garden.
4. To provide milk and butter for my family the whole year through.
5. To keep an average of at least 30 hens.
6. To improve my orchard this year.
7. To work for richer lands.
8. To enroll one or more of my children in club work.
9. To add some home convenience.
10. To do something to beautify my homestead.

Our agricultural conditions have started these farmers to thinking and if they only partially carry out the program which has been outlined, it will prove a valuable undertaking. It takes much effort to get farmers to change their system of farming.

Last summer we visited a farm in southern Minnesota that had been growing cereals for years. The return in 1922 for an acre of barley was $22.50. In 1923 this man's land produced more than 3 tons of alfalfa hay per acre and it had been his custom for years to buy alfalfa hay in the West and it cost, in 1922, $25 a ton laid down at his railway station 7 miles away. If it had not been for the Minnesota Experiment Station, this man would still be buying his alfalfa hay in the West, at a cost to him of $25 a ton, and raising barley and wheat that would not be returning him as much per acre as one-third of an acre devoted to alfalfa.

BACON HOGS

According to reliable reports, American bacon has been losing ground steadily to the Danish product in the English market. The English market is one of the principal export outlets for pork products and if the American hog raiser is to hold his share of this market he must improve his hogs by breeding and feeding. The Danish farmer has directed himself to raising the kind of hogs that will produce the best quality of bacon. The process of making bacon in Denmark is not superior to that followed in this country but the hog, due to methods of breeding and feeding in Denmark, meets the requirements of the English market better than does the American hog.

The dairy farmers in this country are in admirable position to produce the quality of bacon demanded in the English market. A large percentage of them have an adequate supply of skimmilk and there are many sections where barley will produce more feed per acre than corn. Skimmilk and barley are two important feeds in the production of high quality bacon. Whey and barley make an admirable ration and produce very satisfactory gains as well as high quality pork.

There are packing companies ready to enter upon an educational program among the hog producers to breed, feed, and grow hogs for bacon production. What is desired is lean bacon. An inducement to raise hogs, which will measure up to the standard for bacon, will be made by paying an increased price for them.

DAIRY FARMERS' PROBLEM

Cow testing associations until recently have not been properly recognized by the leaders in dairying. For the past twenty years these institutions have been gradually working their way into the system of dairy development. The first work of testing cows on the farm was done by the Illinois Experiment Station in 1901. A few years later Helmer Rabild, of Michigan and now of the Dairy Division, organized the first cow testing association in Michigan.

It is with keen satisfaction that we note that Hon. Frank O. Lowden, president of the Holstein-Friesian Association of America, says in the Holstein-Friesian World:

"Whenever a cow testing association is organized in any community, the unprofitable cows begin to disappear. For the owner, having before him the cold fact that a cow is not producing milk enough to pay even for her feed, to say nothing about labor, soon rids himself of her. If the dairy farmers of the country all belonged to cow testing associations, there would not be the slightest danger of overproduction within the life of any man living. For as prices declined, the farmer would make a further elimination of the least profitable cows, and in this way production would be curtailed until the price rose again. I know of no other place where production can be so easily and so inexpensively adjusted to consumption as upon the dairy farm. This association and other pure-bred dairy associations can do more effective work than in encouraging and fostering the organization of milk testing associations wherever they do not now exist. Scrub bulls will disappear. A large demand for pure-bred bulls will come and the unprofitable cow will become taboo."

Mr. Lowden strikes at the very heart of the dairyman's problem, and we could conceive of nothing that would be of greater service to the dairyman than to have all the cows producing milk in this country give an account of themselves before the milk scale and the Babcock test.

TRAVELING SOILS LABORATORY

The Soils Department of the Ohio State University is co-operating with the Erie Railroad in equipping a "Traveling Soils Laboratory". Several cities in northeastern Ohio will be visited, beginning August 5 and continuing until August 15. This Traveling Soils Laboratory will be equipped to determine lime requirements of the soil brought in by farmers and their content of organic matter, nitrogen, and available phosphoric acid. The following directions have been given for taking soil samples:

"With spade dig holes 7 inches deep at 10 or 15 places in the same field. Remove thin slice from side of each hole. Mix together, dry, and pulverize. Bring one pint for analysis. Confine each sample to one kind of soil only."

After the soils have been analyzed, the farmers will be given advice as to the kind of fertilizers to use and in what way the soil should be handled to bring the best results.

Much money has been wasted in the purchase of fertilizers by farmers who lack knowledge concerning the composition of their soils and what kind of fertilizers should be purchased for them.

The Ohio State University and the Erie Railroad should be commended for giving the farmers of Northeastern Ohio an opportunity to learn the composition of their soils and what fertilizers they need.

PERTINENT QUESTIONS

The several state-wide co-operative marketing companies in Wisconsin have created what is termed the Wisconsin Co-operative Marketing Council. It is made up of one representative from each of the co-operative marketing companies. This council meets from time to time to discuss questions pertaining to the co-operative marketing of farm products. At their next meeting the following pertinent questions will be discussed:

1. To what extent will increased efficiency and co-operation remove the bad effect of surplus production on the industries of this nation?
2. Why is it that the extensive development of co-operative marketing has had no influence on the basic problems of overproduction facing the farmer?
3. Can co-operative marketing achieve what its leaders hope for if measures are not taken to prevent the periodical recurrence of glutted markets?
4. Why is the demand for farm products as well as other products almost continually below the supply of such products?
5. Why does the farmer's cost of production almost constantly exceed the returns which he is able to realize on his labor and his investment?
6. What, if anything, can be done by the state and the nation to create a demand for farm and other produce that shall absorb the supply of such produce?
7. What is the effect of our present system of taxation, both state and national, upon agriculture and upon the demand for agricultural products and is it possible to make a change in these systems that will improve the agricultural situation?

Think on these questions. It will bring a better understanding of our agricultural problems.

Soy Beans and Sudan Grass

How about sowing soy beans in drills 30 inches apart, cultivating them once, waiting about a week and then sowing 10 or 12 lbs. of sudan grass, cultivating again, and then cutting for hay?

Kansas. L. R. S.

The evidence regarding the advisability of growing sudan grass and soy beans is somewhat in conflict. A few people have reported successful mixtures, others have had adverse results. We have no record of anyone having tested out the method of combination suggested by the inquiry. Since both soy beans and sudan grass grow well, however, it is reasonable to believe that the combination can be made. By putting in the soy beans two weeks in advance and sowing 10 to 12 pounds of sudan grass two weeks later and cultivating it in would give an excellent prospect for a stand of both. The experiment is well worth trying and probably will succeed on land that is adapted to the crops. It is probable that it will succeed better than where the sudan grass and soy beans are mixed and sown broadcast, though fair yields have been secured where this has been done.

Minnesota Exp. Station. ANDREW BOSS.

Pasturing the Nurse Crop

Kindly give me your opinion as to whether or not you recommend pasturing alfalfa seeded with oats as a nurse crop; also sweet clover seeded the same way.

Coldwater, Mich. E. A.

We would hesitate to pasture alfalfa that has been seeded with oats, and would ordinarily prefer to cut the oats for hay. There are a number of farmers who have followed this practice and report excellent results. If this is done, care should be exercised not to turn the cows out when the ground is soft so that the young alfalfa is tramped. Care should also be exercised not to pasture the young alfalfa too close.

We have never attempted pasturing off the nurse crop and recognize that we are giving, quite largely, a personal opinion. Men who pasture off the nurse crop seeded with alfalfa are quite enthusiastic about this practice. They assert that if ordinary care is exercised, the results are excellent. Cows will not eat the grass off so closely as to do any considerable damage.

Sweet clover seems to be somewhat more hardy than alfalfa, and we would have no hesitancy in pasturing the nurse crop in this case. We recommend this practice where pasture is desired. We have less fear in the case of sweet clover because the seed does not cost as much and we are not quite so anxious to be insured of a good stand the succeeding year. We are quite satisfied if the stand is sufficient to make good pasture and leaves a fairly good growth for plowing under the same fall or the following spring.

Topdressing Alfalfa—Sweet Clover With Soy Beans—Paraffin For Silos

Would like information on top-dressing with manure new seeding alfalfa that is two years old. It is claimed around here that top-dressing new seeding alfalfa kills the plant.

Would like to know if you can sow sweet clover with soy beans and be sure of a crop of the clover for the next year. Can you sow sweet clover after soy beans are taken off in fall or is it too late to sow it then? Which is the best variety of sweet clover for pasture on hilly ground?

Is it advisable to wax a silo on the inside at the same time it is being filled to keep the silage from spoiling? The Standard Oil Co. is turning out a product that it recommends for that purpose.

Wisconsin. D. BROS.

We do not know of any reason why the top-dressing of alfalfa should do any harm, whether the alfalfa is old or new. As a matter of fact, we would consider it would prove helpful and our only question is as to whether this would be the most profitable place to put the manure. The application would have to be very heavy to do any damage.

We have heard of no experience of seeding sweet clover with soy beans. If the soy beans are sown solid, the sweet clover might be sown after the soy beans have been planted, providing there will be no further cultivation of the ground. If the ground is cultivated, the sweet clover could be sown immediately following the last cultivation. Where soy beans are grown in rows, it would be possible to seed the sweet clover after the last cultivation under the same method as is followed in seeding alfalfa or sweet clover in corn.

You might have success in seeding sweet clover following the harvesting of a crop of soy beans, but we are inclined to believe that for your section and climate this would not prove highly satisfactory.

We recommend the use of the biennial white sweet clover. This is the cheapest seed and proves very satisfactory under most conditions. It is said that the yellow biennial will give a somewhat more branching growth and will make a somewhat better class of hay. However, our main recommendations for sweet clover are their use as pasture and green manure. For these purposes the biennial white has proven highly satisfactory. It is well to bear in mind that the scarified seed should be used as otherwise more seed is required. The recommendations are to use from 10 to 15 lbs. of scarified seed per acre. In our own experience where we have grown sweet clover for a number of years, we find that we get a very excellent stand with only 10 lbs. of seed to the acre. If the land has not previously grown sweet clover or alfalfa successfully, the inoculating material should be used in order to insure the best growth.

We would suggest writing the Dairy Division, U. S. Department of Agriculture, Washington, D. C., for a bulletin on the "Treating of the Interior of Silos with Paraffin". They have found it very satisfactory.

Molds In Cheese Curing

Please inform me how to get rid of fungus growth in a cheese storage room.

Los Angeles, Calif. O. V.

Fungi includes molds, mildews, rusts, smuts, mushrooms, toadstools, puffballs, and other allied thallophytes. A brief description of the appearance, color, size, extent, frequency of occurrence of the growth in the curing room, and some description of the room itself as to temperature, humidity, light, construction, etc., would enable one better to understand just what the difficulty is. I suppose you refer to mold on the surface of the cheese, or possibly to mold found inside the cheese when it is cut.

If cheese becomes moldy inside before it has been cut, this is positive proof that the surface or rind of the cheese was not properly closed up in the process of manufacture. The rind of an American, Swiss, Brick, or Limburger should be perfectly closed, so as to cover the cheese air tight without any breaks or opening. The rind of a cheese, like the skin of an orange, banana, or apple, is necessary to protect the interior. Any slight opening left in the cheese surface by careless workmanship in the factory will admit air to the interior of the cheese while curing in the cellar, and as a result mold will grow freely throughout the interior of the cheese wherever the air penetrates.

Normal cheese gives off a little carbon dioxide during the curing process, and this should fill any interior spaces in the cheese and prevent the growth of molds in these spaces. If air is allowed to enter through the most minute rind openings or cracks, even a small proportion of air mixed with the carbon dioxide inside the cheese will permit a development of mold. It is for this reason that holes are intentionally punched in the surface of Roquefort cheese in the curing room, as without some air in the interior the desirable mold could not grow in Roquefort. If American cheese is found to be moldy inside when first cut or bored, the maker is to blame.

Mold requires both moisture and air for its growth. If cheese becomes moldy on the outside in a few days while in the curing room, this generally indicates that the humidity or dampness of the room is too high. With Swiss, Brick, and Limburger cheese, the humidity must be kept high during curing; therefore, to prevent mold from accumulating on the cheese surface, these cheese must be washed with salt brine about every two days, as mold cannot grow in a strong salt brine.

American cheese are not washed in the curing room; but if they get moldy they may have to be washed, cleaned, and dried after curing and before marketing in order to give the rind a clean appearance. This may occasion a good deal of extra labor and expense. American cheese are always first dried on the surface as soon as they are taken from the press. The usual factory "curing room" at the present day is nothing more than a drying room where the cheese are placed on shelves, turned over once or twice daily for three to ten days, until they are well dried on the surface and are ready for paraffining or boxing.

If the new cheese gets moldy on the surface within the first few days and before it is thoroughly dry, this proves that the curing room is too moist. The usual remedy is better ventilation.

In a tightly closed curing room filled with new cheese the air will quickly become 90 per cent humidity, or nearly saturated with moisture evaporated from the cheese. Further drying of the cheese surface will then be practically stopped and the mold will have a good chance to grow on the cheese or even on the shelves or walls.

As the air out of doors is usually much less than 90 per cent saturated with moisture in this country, often as low as 30 or 50 per cent, all that is necessary to correct the trouble with mold is to ventilate the curing room. This is usually done during the coolest hours of the day or night by opening a few windows and carefully closing them again before the temperature rises. Wooden shutters over the windows to exclude direct sunlight help to keep the cheese room cool and are needed at many factories in summer.

The paraffining of the clean, well-dried cheese before it goes into the cold storage or cold curing room at the warehouse helps to prevent subsequent growth of mold on the surface.

If the factory curing room is quite moldy, begin ventilating it at night. I would also suggest taking out the shelf planks (which should not be nailed down) and giving them a thorough scrubbing and scalding, drying them well in the sun, and putting them back. Scrubbing the curing room will help to remove the seeds of mold, and keeping the room moderately dry will prevent them from growing. When mold "goes to seed" it usually turns black or some dark color, and the black or colored spots should be most carefully cleaned.

Some people have burned sulphur on a piece of red hot iron in a curing room to prevent mold; but if the room stays damp the mold will grow again after the sulphur fumes are gone. You might wash the shelves with formaldehyde, or chloride of lime, or a number of other disinfectants, but a good, thorough cleaning of the room and sufficient ventilation are the most important means of preventing the appearance of mold on cheese. J. L. SAMMIS.

Wisconsin College of Agriculture.

Curing Hay

HOARD'S DAIRYMAN:—I have recently noticed several articles in your good paper on the subject of curing hay. I have read with interest the article in the issue of June 27th by Edw. Hoverson of Montana.

Mr. Hoverson's method is absolutely correct for his territory and for all of the high, dry altitudes, particularly on this side of the Rocky Mountains. Wonderful hay can be cured in that altitude and in any really dry area if the ground is dry at that time.

However, no set rule can be followed for the making of hay. If some person, even in Mr. Hoverson's territory, would follow his directions when the ground happened to be wet, or if he got into his field a little too early in the morning to bunch his hay or worked in it a little too late at night when he was hauling from the field, he would be very likely to have ashes instead of a barn or a stack in a few days.

That system cannot be safely followed at lower altitudes where there is more humidity in the atmosphere. The cause of spontaneous combustion is moisture on the plant, not in it. By cutting his alfalfa in the afternoon a considerable proportion of the moisture it gathered during the night has been absorbed by the sun and he has a smaller content of moisture in the plant itself. If, however, he cuts it on a cloudy day or even a bright day soon after the field has been irrigated, he is pretty likely to have trouble.

However, what I want to say is that at altitudes like Wisconsin, Indiana, Missouri, and other states, generally speaking, east of the Missouri, this system cannot be safely followed. I have seen the system very successfully followed even in South Dakota, a short distance east of the Missouri, but only when the ground was exceedingly dry and the weather was very hot. I have seen it tried repeatedly in other states when it was an absolute failure. I saw it thoroughly tried in Missouri where the hay was baled the afternoon of the day after being cut and it spoiled. The ground was dry and the day was hot and the hay was not cut until about noon of the day preceding and was not stirred until after the dew was all off the morning that it was baled in the afternoon.

Again, I say there is no set rule for making hay. Conditions in different localities and even in the same localities vary so greatly that judgment must always be exercised.

Virginia. A. E. CHAMBERLAIN

Judges at 1924 Dairy Cattle Congress

Announcement is made by the management of the Dairy Cattle Congress that the judges at the fifteenth annual show to be held at Waterloo, Iowa, September 22nd to 28th, will be as follows: Holsteins, R. E. Haeger, Illinois, Jerseys, F. W. Barber, Tennessee; Guernseys, L. S. Wilson, Minnesota; Brown Swiss, J. B. Fitch, Kansas; and Ayrshires, H. H. Kildee, Iowa All of those men are authorities on dairy type and have had wide experience in the show ring

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, D. C., JULY 9—The first problem faced by Dr. C. W. Larson, chief of the Bureau of Dairying, who was appointed as chief of the new bureau on July 2, was to prepare and submit the preliminary estimate of expenses for the bureau's activities for the fiscal year of 1926—that is, the year beginning July 1, 1925.

⚜

The press service of the U. S. Department of Agriculture issued a bulletin the day following the appointment of a chief of the Bureau of Dairying, outlining briefly the work which the bureau would carry on. Particular emphasis was given in this bulletin to the value and importance of research work in the bureau, pointing out that research in the past had opened doors of opportunity to new developments and new sources of profit and service. Special mention was made of the research discoveries in utilization of skimmilk products, in nutrition, breeding, and development of better producing dairy cattle. Mention was made also of the market milk research and study, and then emphasis was placed on the work of introduction, by which research results are carried out and made available to the whole public. This press bulletin has been given wide circulation.

⚜

Charles W. Holman, representative of the dairy industry, sent to the International Institute of Agriculture session at Rome, by the U. S. government, is home. He made a brief report of his trip to the Farm Hands Club luncheon this week. The proposal of the U. S. government that agricultural organizations be given associate membership in the institute did not carry, but a resolution was adopted looking to international organization of agricultural societies with close affiliation with the institute. Some reforms in the administration of the institute were adopted, looking to better and faster statistical information and a resolution was adopted asking for special attention to dairy statistics, internationally. After the Rome meeting, Mr. and Mrs. Holman visited Germany, Denmark, and England, studying farming conditions and the work of the co-operatives. He says the most successful co-operative spirit and enterprises seen were in Denmark. Agricultural co-operation in England is at a low ebb, he states. Economically, that is, measured by the purchasing power of their products in terms of what farmers must buy, he found the farmers in Europe generally better off than American farmers at this time. They were getting uniformly better prices, compared with the prices of their requirements, than American farmers are receiving.

⚜

C. E. Gray of the Golden State Milk Products Co. of California has been spending a few days here. He has been in the East largely in the interest of the casein industry, watching the tariff controversy, and looking out for the future prospects. He states he does not believe that the users of casein are now half as anxious as they were at the time of the high prices for the tariff to be taken off, and thinks there is now a much better understanding of the possibilities of a full supply of domestic casein, at a fair price, if the market is steadied and buying continues on a more even basis.

⚜

Delay in issuing any statement, or in the appearance of the promised "Treasury Decision" as to the interpretation now to be used by the Internal Revenue Bureau in guiding their agents in the enforcement of the "adulterated butter law", leaves the butter industry somewhat at a loss to know just how to proceed. The Tilden case, on close study, is being held to indicate only that 16 per cent of moisture is not an evidence of adulterated butter unless it was incorporated in the butter in some other way than by a standard and workmanlike method of manufacturing the butter. That is, each churning of butter must stand on its own merits; first, as to moisture content, and second, as to the method used in its manipulation. In view of this, and of numerous other angles in the case, there is a growing demand for clarification of the situation either by a decision or by further legislation. The best advice that is being handed out here is, keep the butter *within the state* standards.

How much does it cost a co-operative association to produce butter from its surplus milk? This is one of the questions the U. S. Tariff Commission is getting ready to find an answer to, as the butter tariff question comes up to them to investigate.

"Grandma's Ginger Ale"

Ever chanced to be a-shockin'
When the sun was scorchin' hot?
Have the sweat stand on your forehead
And your throat a sticky clot?
Then look up and see a figure,
Toddlin', bent, and ofttimes frail,
Comin' down along the barley—
Grandma with her ginger ale?

P'r'aps you've drunk your share of water,
Stopped the binder every round,
Drained the water bag in strivin'
To submerge the thirst you've found;
P'r'aps you've just about concluded
That no drink can thirst assail,
When along comes smilin' Grandma
With her pail of ginger ale.

'Member growlin' at the "stickers",
Gettin' peevish at the beard,
Sayin' things about the bundles,
Fingers raw or "binding seared"?
'Member frettin' at the stubble
As in shin it left a trail,
Then forgettin' all these troubles
Sippin' Grandma's ginger ale?

'Member gettin' quite dramatic,
Thinkin' what a life you led,
Sayin' things about the shockin',
Seein' everything in "red"?
'Member bein' tired and dusty,
Mouth all puckered up and stale,
Then reversin' all decisions,
Grandma's brought the ginger ale?

'Member sittin' in the shadow
Of a high-piled, golden stack,
Grandma in her old sunbonnet
With her arm across your back?
'Member drinkin' while the locusts
Hit the tin like fallin' hail?
Never was a time so pleasant—
Grandma and her ginger ale.

'Member when the pail got empty
How you smacked your lips for more?
Every pain somehow had vanished
Every muscle ache and sore;
Now, sometimes, when worldly conflict
Leaves its many pains to wail,
Comes a wish that smilin' Grandma
Might be near with ginger ale.

—R. D. GALT.

The First to Fourth Reasons Why—
It Should Be a GMC!

General Motors Trucks will do your farm work better—at lower cost. Here are four reasons why:

1—GMC price is lower than other trucks of comparative quality.
2—GMC upkeep is much lower. Parts are simple and accessible. Every working part is designed with extra strength. Every wearing part has an easily renewable bushing or bearing. Even the cylinders are removable. A GMC needs practically no service attention. It takes half the time to do it, when it does.
3—This truck will go places and do work that will give you a real surprise if you haven't seen a GMC in action. The now famous GMC Two-Range Transmission enables a fully loaded GMC to walk up stiff grades and slow through mud and deep snow—*when another truck would probably stall.*
4—Easy terms of payment may be arranged through General Motors Acceptance Corporation.

Ask for a catalog and the other reasons why.

Cow Testing Associations

(Continued from page 7)

pound for fat; the creamery, 38 cents. Milk retailed for 8 cents per quart; butter, 44 cents per lb.—A. G. Elbert.

Allenton—Kohlsville, Wis.: This association is highest in the county and the state for the past three months regarding percentage of quality cows, fat average, and high herd fat and milk average; also 100% in pure-bred sires, alfalfa, balanced rations, Holsteins, tuberculin tested herds, and all members' farms named and registered. The primary object this year is to make this association R. O. P.—365 lbs. fat or more entire average for a year.—V. M. Anderson.

Farmington, Wis.: The cool weather has affected the dairy industry in this section. The need of a small silo for summer feeding is felt. The condensery and creamery paid 47 cents per pound for fat; the cheese factory, 45 cents.—J. G. Stratheam.

Spring Green, Wis.: During the month of June 74 out of 370 cows tested produced 40 lbs. or more of fat each. One herd was tuberculin tested. —A. F. Clump.

Milton—Edgerton, Wis.: A joint picnic of this and the Footesville—Evansville Association was held at which A. J. Cramer gave an interesting talk on summer feeding of grain to cows on grass. The condensery paid $1.84 per cwt. for milk. The creamery paid 42 cents per lb. for fat. Milk retailed for 12 cents per quart.—W. H. Roberts.

Cedarburg—Grafton, Wis.: The average production for the 25 herds was 932 lbs. milk, 36.1 lbs. fat. Fifty tons of bran, at $25.50 a ton, were purchased, also 30 tons of gluten at $34 a ton and 30 tons of oil meal at $43.50 a ton. Cows fed grain with pasture are milking steadily, while cows on pasture alone dropped in milk flow. Market milk sold for $2.24 per cwt. The creamery paid 46 cents per lb. for fat; the cheese factory, 40 cents.—G. Wild.

Farmers' Cattle Judging Contests

A continuous cattle judging program for farmers from every state is being arranged for the National Dairy Exposition at Milwaukee, September 27th to October 4th. Coupled with the contest will be dairy cattle demonstrations by expert judges of cattle. These two features will afford a liberal education to every man who is a buyer of dairy cattle and wishes to be informed on how to select good ones.

Another attraction for farmers will be the exhibit of grade cows from cow test associations, all to go on the auction block during week of the Show. These cows will all be exhibited in the regular classes of the Show and judged by the regular judges of the Show, their health certificates entitling them to enter any state and their record of production certificate officially signed will be attached to the cows.

Milk Consumption In England

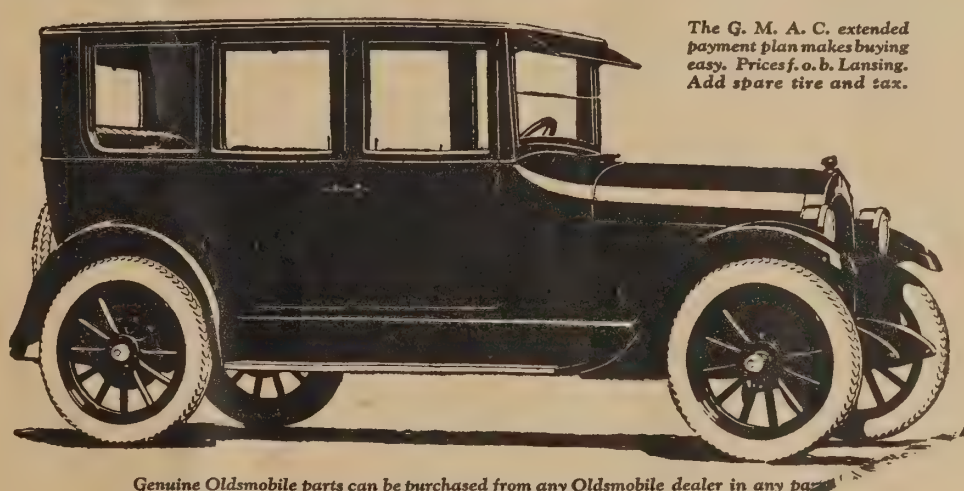
According to the British Ministry of Agriculture, the consumption of milk in England and Wales amounted to 11½ billion pounds. The estimate included the following items: 7,300,000,000 lbs. milk for human consumption; 2,000,000,000 lbs. milk made into butter and cheese on farms and in factories; 1,250,000,000 lbs. milk made into cheese on farms and in factories; 300,000,000 lbs. milk made into condensed milk; 400,000,000 lbs. milk made into cream and other miscellaneous products; and 250,000,000 lbs. milk is put down as "allowance for waste". No estimate is included in the total of 11½ billion pounds for milk fed to calves.

a SIX Sedan at $1135 F.O.B. Factory

For Year 'Round Comfort

Drive this Oldsmobile

6 Cylinders, Fisher Body, General Motors Units



For $1135 we give you a Sedan with body by Fisher—four doors, and lots of room for five. This handsome car has a forty horsepower, six-cylinder engine, with pressure feed lubrication to every rotating part—assuring long life. Other big features are Delco starting, lighting and ignition system (finest made)—Harrison radiator—dry disc clutch—high pressure chassis lubrication—noiseless universal joints—5½-inch frame—110-inch wheel base—springs almost as long as wheel base.

It is built by Oldsmobile and General Motors working hand in hand. Naturally the price could not possibly be $1135 if it were not for the vast resources, purchasing power and engineering talent of General Motors, which Oldsmobile enjoys.

Don't pay $1135 for *any* automobile without examining the Oldsmobile Six Sedan first. Any one of our 2500 dealers will be glad to give you a demonstration. See the dealer in your neighborhood.

The G. M. A. C. extended payment plan makes buying easy. Prices f. o. b. Lansing. Add spare tire and tax.

Genuine Oldsmobile parts can be purchased from any Oldsmobile dealer in any part of United States, at a standard price established by the factory, without the addition of war tax, handling, or transportation charges. Every Oldsmobile dealer has a master parts price list issued by factory, which is always open for owners' inspection.

OLDSMOBILE SIX

PRODUCT OF GENERAL MOTORS

Association Members Buy Pure-breds

At the recent National Holstein Sale held at Richmond the largest group of buyers were the members of Virginia cow testing associations. Seventeen members in eight of the fourteen associations in the state purchased a total of 48 animals. They paid a total purchase price of $13,140 or an average of $274 per head.

The cow testing association members were especially strong buyers of good young stock, which were desired for foundation purposes. Fifteen head purchased were yearlings or under, thirteen head were two-year-olds, and four were three-year-olds. Even with this preponderance of young stock the average purchase price was better than the sales average which seems to indicate that they were after the best.

That cow testing association members are realizing the value of having good sires is shown by the fact that the three highest price bulls sold and eight of the total twenty sold in the sale were purchased by members of Virginia cow testing associations.

It was very gratifying to see so much of this excellent stock stay in Virginia, especially with cow testing association members where there will be an opportunity to measure the improvement that this stock will bring about in these herds. Several other of the Virginia buyers will probably also soon take up the cow testing association work.—L. P. EMMERICK.

Nebraska's new champion Holstein cow for butter production in one year as a junior two-year-old is Jennie Segis Sylvia Waldorf of the Woodlawn Dairy herd at Lincoln. Her record is 20,232.9 pounds milk containing 764.93 pounds butterfat, equivalent to 956.1 pounds butter, according to the Advanced Department of The Holstein-Friesian Association of America.—Holstein-Friesian Ass'n of America.

LUCY THOMPSON

For the Sweet Tooth

My last can of apple butter is gone and all I have left in the way of "spread" is a couple of small glasses of jelly. Naturally I am looking forward to getting things filled up again for I find that a good supply of jellies and the like saves me a good deal of dessert making, especially on days when there is fresh bread.

I don't think any of us hesitate to tackle anything in the way of jams, conserves, and butters but when it comes to jelly it is different on account of the eccentricities of that thing called pectin that has to be in fruit juice if the jelly is to set. A certain amount of acid has to be there, too, or else the pectin won't act and many an hour have I wasted trying to make jelly out of somethink that simply won't jell and I might have saved a lot of work if I had known any test. It would be all right and easy if we always wanted apple jelly or something of the kind; it is the thirst for variety that gets us into trouble if we have no chart to steer by.

The Michigan Agricultural College has made some tests and has published them in language so easy to follow that they don't seem a bit technical. The wood alcohol test for pectin is this: Mix one tablespoon of cooked juice with one tablespoon of wood alcohol (this is a poison) and if a large amount of pectin is present it will collect in a mass in the bottom of the spoon; if only a small amount it will be seen in small particles. You must watch this test carefully as the alcohol will dissolve the pectin in a short time.

The Epsom salts test is this: Mix together one teaspoon cooked fruit juice, one-half teaspoon sugar, and one-fourth teaspoon Epsom salts (all level measurements). Stir until all are dissolved and let stand five minutes. If the mixture sets into a jelly in this time it is a good jellying juice.

A large amount of pectin calls for a large amount of sugar, nearly or entirely, equal parts of sugar and juice. Plenty of pectin but not much acid is likely to yield a tough jelly as in the case of quince but quince mixed with apple makes a jelly of fine consistency and flavor.

The juices that jelly most readily are crabapple, apple, half-ripe grape, raspberry, blueberry, gooseberry, and currant. Any one of these may be combined with others that jelly less readily such as strawberry. peach, pear, pineapple, and cherry.

Pectin may be made from apple or orange. For the former take one pound of apple, skin and cores, juice of one lemon, one quart of water. Boil one-half to three-quarters of an hour, let drain through cloth bag, bottle juice, and put away. Add this to your other fruit juice until you get a good pectin test.

Next winter when you want a little variety with your meat you will be glad if you have made some mint jelly. For this add some crushed mint leaves to apples while cooking, and put a few drops of green coloring in the juice after it is strained. Be careful not to get too much of this. Mint jelly not only tastes good but looks beautiful. Don't buy a whole bottle of expensive coloring but get a few green mints at the candy store and boil them up in a little water.

If you are a very particular jelly maker you will drain the juice through two thicknesses of cheese cloth without pressure. This makes a sparkling, clear jelly. Then you can boil the pulp in a little more water and squeeze it this time making jelly that is good but not of "company" quality. Then you can take the pulp and make it into a good fruit butter.

Most of us do not make any distinction between jams, marmalades, butters, and conserves because we usually take what we have on hand and make it up in the most convenient way and that is all right as most of us are not professionals. If it turns out quite thick we may call it marmalade and if it has nuts in it, it is conserve. That is near enough for practical purposes.

Plum makes one of the best and richest conserves. For this take:

6 lbs. plums, 2 oranges sliced, 1½ lbs. large raisins, seeded, ½ lb. nut meats, 3 lbs. sugar.

Wipe oranges clean, cut in quarters, and slice quarters thin, removing all seeds. Let stand in water to cover over night. Cook plums without water till soft and press through sieve. Add oranges (cooked till tender) and raisins to the plums and sugar and cook till the mixture thickens. Add nuts near the end of the cooking.

For rhubarb conserve take:

2½ lbs. rhubarb, 3 lbs. sugar, ¼ lb. nut meats, 2 oranges or ¼ lb. candied peel, grated rind and juice of two lemons.

Prepare oranges as above, chop rhubarb fine, add sugar, lemon juice and rind, and put to cook. When the sugar is melted and the mixture is boiling throughout add the nut meats chopped fine. If orange peel is to be used instead of oranges, put it in with the nut meats and cut it fine. Cook about thirty minutes.

The Baby's First Year Clothing

It is nearly always the first baby who suffers from too much in the way of lace trimming, fancy bonnets, and beruffled dresses. After a mother has been once through the grind of making and keeping up such an elaborate outfit she usually decides to put her next baby into the simplest things possible.

Only one mother I know had the courage of her convictions with her first born. She knew that the place for a baby the first year is mostly home in bed and that dressing up an infant only torments it. I helped her with the whole outfit and, except for one little dress to be baptized in, there was nothing in it fancier than a little feather stitching on the slip hems.

A little mother was telling me the other day that her baby had just celebrated his first birthday and that in honor of the occasion she had dressed him in his best and given him a party. He got so excited at seeing the people and hearing all the other little babies crying that he worked himself into a case of hysteria.

"That night was the first time I ever had to rock him to sleep," she told me, "and I was worried to death." No wonder. Some doctors think that an experience like that is enough to affect a child's nervous system permanently. But to get back to clothing.

A child specialist has recently worked out the following list of clothing for the first year and to me it seems very practical:

1. Straight flannel bands. These are worn only the first weeks until the cord dressings are off, and are now often omitted, the gauze bandages being used instead.

2. Knitted bands with shoulder straps. These should be straight sided and not barrel shaped. Two small (size 1) and two larger (size 2) should be provided.

3. Shirts, light or medium weight, part woolen or cotton in warm climates, with long sleeves and high neck. From two to four are needed.

4. Diapers of birdseye cotton. Five dozen is the least number that will allow for washing only every other day. Several different sizes should be made, such as 18x36, 22 by 44, and 26x52, the largest size.

5. Stockings of part wool or booties long enough to reach over the knee. For changeable or cold climates at least three pairs should be provided; in warm climates none may be needed.

6. Slips or dresses of white washable cotton. Eight or ten slips should be made unless they are to be washed oftener than once a week. Gingham rompers may be used at the end of the first year.

7. Nightgowns of cotton flannel. These save the slips but are not necessary for the first six months. Three or four nightgowns should be made for the older infant.

8. Petticoats of flannel without sleeves. At least three are needed in cold weather.

9. Flannel kimona or sack. One or two are desirable in order to give additional warmth in cold weather.

10. One or more soft woolen knitted shawls, one yard square, or one by one and a half yards. A square of flannel may be substituted.

11. Baby bunting or outdoor coat and mittens in cold climate.

12. Muslin cap or knitted woolen cap or hood.

All day clothes should be removed for the night's sleep just as in the case of a grown person but an infant will wear the same number of clothes night and day. He will sleep better if he is undressed and laid out on something where he can kick vigorously before being put to bed. A gentle rubbing also promotes quiet sleep.

A sleeping bag made of material suitable to the weather is about the only thing that will keep a lusty baby covered at night and a conscientious mother's rest will be very fitful if she is imagining that the baby has kicked himself out into the cold.

Except in very warm weather it is best to keep him in stockings or booties that come over the knee and when he begins to creep to put on moccasins of felt or soft leather. It is

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Miscellaneous Fashions

No. 2118—Neat and Attractive Porch or Morning Dress. Cut in 36, 38, 40, 42, and 44 inches bust measure. Size 36 takes 3 yards 40-inch material with 3¼ yards of braid.

No. 5000—Long-Waisted Dress. Cut in sizes 36, 38, 40, 42, and 44 inches bust measure. Size 36 requires 3⅝ yards of 36-inch material with ⅜ yard 36-inch contrasting.

No. 1702—One-Piece Slip-On Dress, with pleats laid at sides of skirt. Cut in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 takes 3⅜ yards of 36-inch material with ¾ yard 36-inch contrasting.

No. 2120—Jaunty Summer Style. Cut in sizes 16 years, 36, 38, 40, and 42 inches bust measure. Size 36 requires 3⅛ yards 36-inch material with ¾ yard 36 inch contrasting.

No. 2037—Stylish Two-Material Dress. Cut in sizes 34, 36, 38, 40, 42, and 44 inches bust measure. Size 36 takes 2 yards 36-inch material with 1⅜ yards of 36-inch contrasting and 2¼ yards of ruffling.

No. 1911—Men's and Boy's Shirt. Cut in sizes 12½ 13, 13½, 14, 14½, 15, 15½, 16, 16½, 17, 17½, 18, 18½, and 19 inches neck measure. Size 15½ requires 3½ yards of 36-inch material.

Fashion Magazine

From the front cover of our Spring and Summer Fashion Magazine right on through the book, you will see all of the styles which will be popular during the coming season. Styles for morning and afternoon wear as well as those needed for the more formal occasions. And cute styles for the kiddies. There are dressmaking lessons for the beginner, and charming styles which can be made in a couple of hours even by one who is a novice with the needle. Also photos of the most popular Broadway, New York, actresses. So settle your dress problems by sending 10c today for our new Fashion Magazine. You'll save dollars by doing so. Address Fashion Department, Hoard's Dairyman, Fort Atkinson.

Better Milk Bigger Profits

Keep your milk sweet and wholesome by cooling and aerating it with the "Chilly King" Prevent losses from souring and returned shipments

Chilly King
Cooler and Aerator

Cools milk perfectly—without ice—and secures its thorough aeration. Simply built. Easy to clean—no filth-catching corners. Milk flows in a thin film like sheet over V-shaped Spiral Rings Practically 100 per cent efficient. Sizes for all-sized herds. Write for catalog.

DAISY FLY KILLER PLACED ANYWHERE ATTRACTS AND KILLS ALL FLIES Neat, clean, ornamental, convenient, cheap. Lasts all season. Made of metal, can't spill or tip over; will not soil or injure anything. Guaranteed effective. Sold by dealers, or 5 by EXPRESS, prepaid, $1.25.

HAROLD SOMERS, 150 De Kalb Ave., Brooklyn, N. Y

When writing advertisers please mention Hoard's Dairyman.

most important for the later shape of the child's foot that his shoes and stockings be well-fitted and plenty long. Any mother who has had any experience with corns, bunions, or fallen arches will never want to pass them on to her child.

It is not safe simply to dry a diaper and use it again as it is likely to cause a rash on the delicate skin. The best way to wash diapers is to rub them in hot suds with mild white soap, boil, rinse until all soap is out, and dry in the sun if possible. Woolens must not be washed in hot water as it stiffens and yellows them. Lukewarm water for both rinsing and washing is best for these.

Diapers should be cut twice as long as wide with four inches allowed for shrinking and hem. Straight bands are made by tearing three-fourths yard of material into strips six inches wide. They are not to be hemmed. Shirts may be made from pieces of underwear.

Draw strings at neck and sleeves do away with all need of buttons on the first simple things and make them adjustable to the baby's growth. A fold run in over the shoulders may be let out as the baby gets larger. The first slips are 20 or 22 inches long while the nightgowns are 30.

If all the clothing is opened all the way down the front the job of dressing is simplified.

The dress may be spread out, petticoat on top of it, and shirt on top of that with shirt sleeves inserted in dress sleeves. The baby in band and diaper is laid on these on his back, arms put in sleeves, and the three garments fastened down the front quickly and easily. Tape ties are often used for fastenings.

Household Suggestions

If you have some flavorless canned plums, as I had, or some flat tasting apples, buy a pound of dried apricots, soak and stew them until they are tender, then mix with the plums or apples in the proportion of one quart of canned fruit or sauce to one-half pound of apricots and use in pies. My family is enthusiastic in its praise when I serve this dessert. The apricots may be used in the same proportions to make jam when the supply runs low or is limited to one or two varieties.

⚜

I have several times read inquiries from women who had difficulty in finding graham or whole wheat flour and when they did find it, deplored its comparatively high price. The answer is, "Go to the middlings bag, thou farm mother." If you like it coarser, add bran from the bran sack in any proportion that pleases you. I like it about one of bran to four of middlings. Why feed all the vitamins to the cows?

⚜

As the rhubarb season approaches remember that a pinch of salt—not too much—will save half the sugar. This applies to any acid fruit—plums, oranges, or berries.

Cookies

1 cup melted butter or other shortening, 1 cup molasses, ½ cup brown sugar, 1 cup water or coffee in which is dissolved 1 teaspoon soda, 1 teaspoon salt, spice if desired, 1½ cups middlings. Flour to make soft dough. Mix, roll, cut out, and bake in a quick oven.

Bran and Middlings Recipes

2 cups middlings, ½ cup bran, 2 cups wheat flour, 2 teaspoons salt, ½ cup molasses, 2½ cups sour milk, 2 eggs (1 will do), ¼ cup sugar, 1 teaspoon soda in milk, 2 teaspoons baking powder in flour. Mix thoroughly. Makes two small loaves or eighteen muffins.

New York. C. N. HALE.

Friendly Talks For Farm Folks

That wife is a prize who insists that the harvest money shall go for a tractor, a harvester, and a dependable farm truck. And the following season, if the husband of such a wife is the sport we think he is, he will be equally emphatic on insisting that the surplus buy a new fur coat, hardwood floors, and maybe a little coupe—all for the Missus. The year that everything goes out and nothing comes in they can share alike with the best grace to be mustered.

⚜

When Mrs. Arthur Preston wants to reward her husband for his many loving kindnesses to her, or, more likely tease him to give her fifty dollars out of the coming dividend, she goes into the kitchen and there concocts a thick slice of home-cured ham baked in milk so that it literally melts in a man's mouth; a pan of golden-brown corn muffins, a sight better than any Arthur's mother ever made in her life; potatoes baked in their jackets,—said jackets cunningly slit and a big lump of fresh June butter inserted in each; a banana pie with a frosting of snow-like sugar covering the toothsome top; and finally a strawberry shortcake of such tenderness and incomparable goodness that Arthur, after his meal, just straightens out in the chair and is as wax in the hands of the best cook in Cattaragus County. Indeed, as the wise man said, the way to many a man's pocketbook is via his stomach.

⚜

Puzzle: When it comes to the end of a perfect day and the grass is down making perfect hay, and a thunder cloud appears in the West, who ever cried, "It's all for the best?" Answer: No one.

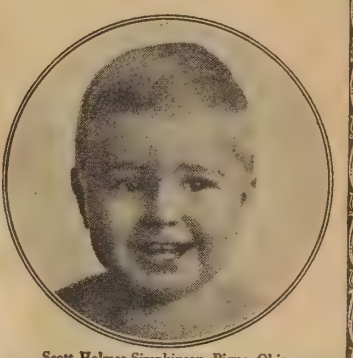
⚜

It cost Simon Bagg three or four hundred dollars to paint up his disreputable old farm buildings this year and, as he proudly says, darned if it ain't worth it.

⚜

A wire from the headquarters of the Mosquito League, Inc. assures us that owing to the continued damp and rainy weather this year, nine hundred-billion new members have joined this powerful organization and are ready in toto—not a non-pooler among them—to buzz, pester, heckle and bite everybody on this green footstool regardless of condition or color. This will be deep and gratifyng news to all those humans who contemplate picnics and outings in the great outdoors this season.

⚜



At our farm there is a new pony which is turned out with the regular team—a mare who has never had a colt of her own, and old Gus, a heavy horse. Betty, the mare, has always had rather a ticklish disposition like some others of her sex, but she has always been seemingly devoted to good old Gus who forgives her time and again for sly nips and bites to which she treats him a million times a day. Well, out in the pasture Betty and the pony discovered each other and Betty immediately adopted the pony—who is six years old himself—for her own. She won't let harmless old Gus come within a gun's shot of them—chases him about the pasture, kicks him spitefully if he as much as looks in the direction of the pony, and withal acts just like a fighting cow with a baby calf to defend from the world at all costs. The mother instinct in Betty is evidently going strong, but why she should take it out on her inoffensive team-mate is hard to understand. But some women are like that.

-Grass- is not enough!

Cows need more than green pasture, with its 70 to 80% water content, to stay at top-notch milk flow, health and condition. They need Larro too, because they cannot eat enough grass.

Feed Larro every day. Start now and insure, by the addition of the nutritious, high quality, well balanced materials in Larro, the continuous, profitable production which Larro *always* gives.

See your Larro dealer or write to us. Ask us to send you the Larro Dairyman, our free magazine for cow owners.

83 Larrowe Bldg. Detroit, Mich (xxx)

Send No Money

For this practical Cooler and Aerator, which cools the milk in one minute, prevents growth of bacteria and removes all stable and other odors. The milk or cream is poured in at the top through a gauze strainer and it comes out a minute later at a low temperature.

The U. S. Department of Agriculture recommends that milk be cooled quickly as milk cooled as fast as milked keeps sweet longer and gives a bigger cream line.

The ***CP* CONICAL COOLER** is substantially made. Uses ice or running water—as easily cleaned as a common milk pail.

Send your name and address today and the ***CP* CONICAL COOLER** will be shipped by express at once—when delivered pay your expressman **$8.00** for the No. 2 (18-qt. size suitable for 25 cows or less) plus the express charges. Money returned if not satisfied at the end of 10 days. (Other sizes are: **No. 3—34-qt.**, 25 to 50 cows **$9.50**, and **No. 4—48-qt.**, 50 to 100 cows **$12.00.**) Coolers are too large to go by parcel post.

DAIRY MARKET NEWS

Cheese Markets

(Report by U. S. Dept. of Agriculture)

Cheese markets were fairly firm with storage situation continuing to hold center of attention during week of July 5. Wisconsin Cheese Boards both showed price reductions averaging a cent at sessions toward close of week.

The average wholesale prices on American cheese, style Twins, for the week ending July 5, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending		
	July 5 1924	June 28 1924	July 5 1923
	Cts.	Cts.	Cts.
New York	20.6	20.3	24.1
Chicago	18.7	18.7	21.7
Boston	21.4	21.2	25.3
San Francisco	19.5	20.0	23.7
Wisconsin Board	18.3	18.7	20.9

The receipts of cheese at these markets were 5,799,247 lbs. for the week as compared with 5,045,312 lbs. last week and 5,958,021 lbs. a year ago.

Butter Markets

(Report by U. S. Dept. of Agriculture)

Butter markets were unsettled early in the week ending July 5, but firmer at the close. Trading was fairly active including buying for immediate consumptive demand and for storing. Production reports favorable. Imports of small consequence.

The average wholesale prices on 92-score butter for the week ending July 5, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending		
	July 5 1924	June 28 1924	July 5 1923
	Cts.	Cts.	Cts.
New York	41.2	41.9	37.7
Chicago	38.7	39.4	37.5
Philadelphia	41.5	42.1	38.7
Boston	41.2	42.0	38.4
San Francisco	38.5	39.6	41.2

The receipts of butter at these markets were 19,647,153 lbs. for the week as compared with 21,945,284 lbs. for last week and 18,143,774 lbs. a year ago.

Butter Prices for June

The following table is compiled from daily quotations by the U. S. Department of Agriculture and covers the average wholesale prices during June on 92-score butter (extras) at four of the principal markets, together with the receipts and storage holdings at these markets:

	Av. price		Receipts	
	1924	1923	1924	1923
	cents	cents	tubs	tubs
Chicago	39.7	38.8	446,751	430,019
New York	41.5	38.9	408,773	428,233
Boston	41.5	39.9	216,125	191,978
Philadelphia	42.0	39.9	141,153	121,682
Total receipts for			1,212,802	1,171,912
Total receipts since Jan. 1			4,642,673	4,495,309
Storage holdings July 1			618,554	560,996

Ninety-score butter averaged 37.8 cents for June in Chicago, with centralized butter at this market selling for 39.1 cents. Jobbers' prices on extras sold to retailers averaged 41.7 cents in Chicago and 45 cents in New York.

Wisconsin May Butter

(Wisconsin Department of Markets)

The following is an average report of the operations of 100 co-operative creameries in Wisconsin for the month of May, 1924:

No. of creameries	Price paid for fat	Ave. price rec'd for butter	Ave. overrun	Ave. am't. fat rec'd
	Cts.	Cts.	%	Lbs.
2	45	38.5	22.3	24,180
7	44	39.2	23.9	26,745
16	43	37.6	23.9	53,538
17	42	37.2	22.9	33,406
18	41	37.1	20.9	36,907
14	40	37.8	22.6	35,117
9	39	36.9	23.3	15,082
7	38	36.1	21.1	12,952
3	37	35.9	22.6	58,580
2	36	36.3	21.5	22,194
100				31,870

Milwaukee June Milk

The following prices are determined on for the month of June for members of Milwaukee Co-operative Milk Producers:

For the portion sold as fluid, $2.85 per cwt. for milk testing 3.5% fat; and for the portion manufactured, $1.46 per cwt. Four cents added or subtracted for each one-tenth of one per cent variation from 3.5 fat test.

Fifty-two per cent of the total receipts was sold as fluid.

MILWAUKEE, July 15—Butter—Creamery, extra, tubs, 38½c; standards, 38c; extra firsts, tubs, 37@37½c; firsts, 34@35c; seconds, 30@36c.

Eggs—Fresh gathered firsts (new cases), including cases, candled, 24½@25c; ordinary firsts (standard cases), 24½@25c; miscellaneous lots, shippers' cases returned, candled, 21@22c; seconds, dirties, 19½@20c; checks, 19½@20c.

Cheese—American full cream, Twins, 17½@18c; Young Americas, 18@18½c; Longhorns, 18½@19c; Daisies, single, 18@18½c; American, 32c; Pimento, 34c; Swiss, 42c; special market Brick, fancy, 16@16½c; Limburger, new, 22@23c; Swiss, blocks, 26@28c; loaf, 32@34c; imported Swiss, loaf, 44@48c.

CHICAGO, July 14—Butter—Receipts, 22,445 pounds. Creamery, extras, 38¾c; standards, 38½c; dairy, firsts, 36@37c; seconds, 33@35c.

Eggs—Receipts, 34,550 cases; ordinary, 24@24½c; firsts, 25@26c.

Cheese—Twins, 19c; Young Americas, 20c.

FOND DU LAC, Wis., July 12—Average cheese prices (majority of sales), f. o. b. shipping point: Flats, 17¾c; Twins, 17½c; single Daisies, 18c; double Daisies, 17¾c; Young Americas, 18c; Longhorns, 18¼c; square prints, 18½c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange July 12: Single Daisies, 16½c. On Farmers' Call Board, July 12: Twins, 16½c; single Daisies, 16¾c; square prints, 17½c.

NEW YORK, July 14—Butter—Firm; receipts, 8,505 tubs; fresh supply, 57,537 tubs; creamery extras, 40¾c; specials, 41⅛@41¾c.

Eggs—Dull; receipts, 13,243 cases; fresh supply, 60,246 cases; white, fancy, 40@42c; fresh firsts, 26½@32c; western whites, 27½@29c.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

From An Ex-cow Puncher

HOARD'S DAIRYMAN:—In your paper of May 9 about injury to hides from hunters shooting dairy cows, you also say that sounds like a fairy tale. It sure don't to me. I think if you investigate you will find that the cattle that have their hides filled with shot come from Montana and Wyoming and all free range states. The homesteaders will file on a piece of land and put in a patch of grain with no fence around it and try to keep the range cattle and horses off with their shotguns. As I lived in Montana for several years I know what I am talking about as I have had stock shot and killed. The deputy sheriff told me he picked a match box full of shot from a horse that had been killed and there were several more horses in the bunch that were shot so badly they could hardly walk. The man was arrested but they could not convict him as they did not see him do it.

Any amount of stock was shot and killed where I came from. Yes, I came from the wild and woolly Montana. Have saddled and rode many a wild horse and steers and cows or anything that grows hair. Now I am in Minnesota dairying and never owned a dairy cow till I came here or never sold cream. But I have a good herd of dairy cows and am getting along fine. My cows made me $15 a month per cow last winter. I expect them to go $20 or better per cow next winter; in fact, I am going to be the high man at the creamery if nothing prevents.

AN EX-COW PUNCHER.

Get of Sire—County Herd

HOARD'S DAIRYMAN:—Among the different subjects that have been before the public for discussion, through your columns of O. B. B., the past winter, all of them have furnished food for thought, but I believe we can re-open one which will bring together more friends and interest breeders everywhere.

The "Get of Sire Class" was discussed by some breeders and dairymen in every state, with the exception of two, and after reading them all, the old rule for exhibiting a get of sire class still stands good. You have got to pick them according to who is doing the judging.

Last fall I carried two entries in that class and only once were the young stock placed above the matured stock. So far as to agree on a definite class, age, etc., for said class, we have first got to get the different judges to all follow the same principles. Until they do, we have to run a gambler's chance. I have noticed the same judge place a fast class without a mistake and next week he could not judge a slow class without making some awful mistakes. But he may not have been to blame. There is no judge that can judge three or four different breeds in one day without making some mistakes when each and every class has from two to nine or ten entries. So, therefore, let the different fairs provide more judges and give the judge more time to present and explain his reason for his awards.

As proficient showmen, we usually know how the placing of the different classes will be the day that entries close and have got the money figured up to the fraction of a dollar, but if the judge is pushed for time and is judging three or four breeds the same day, you never can tell where the blue ribbon will fall.

Most of the writers in discussing the get of sire class, expressed a desire to encourage more and larger exhibits. I would like, therefore, to see an open discussion in Hoard's Dairyman's O. B. and B. columns on the following subject: Should we encourage or discourage county show herds? Personally, I believe that we should bar a county herd selected from the local county fairs. I believe the day is close at hand when the county herd is a thing of the past. What show has a small breeder with 25 to 40 head or less when he goes up against a county show herd? None. He realizes that and stays at home. And probably chances are that he has got one or two head in his herd that would be of great honor to the breed if they were exhibited at the State Fair and National Dairy Show.

Hope to see some one open a discussion on the subject, A County Pick Show Herd.

THEO. BLOOMQUIST.

Criticises Mr. Ward's Remedy

HOARD'S DAIRYMAN:—I've been a reader of Hoard's Dairyman for several years and never saw an article such as Mr. Ward's in May 30th issue, as to his remedy to improve farm conditions. I believe he is not a broad minded farmer. In the first place, let down immigration bars and let in some of those Northern Europe farmers to increase production. What are you going to do with that increase? The country is oversupplied now. The western farmers have gone broke. They can't get cost of production for their wheat. If it was not for the tariff wall, thousands of bushels would come down from Canada. What would the American farmer do if he were not protected. And, on the other hand, the dairy farmer is not getting more than a living. There are at present thousands of pounds of butter coming from Australia and Argentina in spite of high tariff. If those farmers can produce a pound of butter and ship it to New York and make money, what would the American farmer do if it were not for the tariff wall?

Mr. Ward speaks of the labor shortage. I'm a hired man, work twelve hours a day and get $50 a month. Five years ago I hired out with a farmer for $50 a month. This man was very nice at first but it grew bad and then worse; after I was there a few months the two of us were milking 34 cows. After a while I was milking them all alone. I started to milk at 4 a. m. and went to breakfast at 7 a. m. I had to skim the milk, feed a lot of calves and pigs, and take care of four horses. I started milking again at 4 p. m. and kept working until all was done, the way I would do it for myself. I would see the boss once a week or so and finally got tired out and quit. This man went all over town to get a man to take my place but he couldn't find one, and there were scores of men out of work. Do you know why he couldn't get a man? He didn't know what a hired man was. The farmers could get all the help they want if they knew how to use it.

Mr. Ward wonders if co-operation will work. I'm not a union man but would like to ask Mr. Ward if the railroad brotherhood works. I'll say it does and all other unions work as well. They set a price and get it, otherwise it would stop all transportation and the railroad owners would lose money. If the farmers would co-operate, act as one, and set a price, they would get it because people must eat to live. Of course, they would need high tariff walls to keep foreign produce out.

I believe Mr. Ward is an importer. In all the letters he writes, the tariff wall is in his way. In the O. B. B. columns he contradicts himself as to the city man's wages; everything kept pace with his wages except farm products. Well, why don't you co-operate, Mr. Ward, and make high wages, too?

Amherst, Mass. P. W. V.

QUALITY COMMANDS THE BETTER PRICE

It pays the producer of cream and eggs to sell according to grade.

The man who handles his cream and eggs in a slipshod manner, without giving attention to cleanliness, flavor, feeding, cooling, freshness, etc., cannot expect the same price that is paid for high quality.

If the eggs and cream you sell to the shipper enable him to comply with the grading requirements of the Chicago Mercantile Exchange, the shipper can pay you more for them.

SELL YOUR BUTTER AND EGGS ACCORDING TO GRADE

There is a market for all eggs and cream—good and inferior—but it is poor policy to pull the good quality down to the level of the inferior by mixing them together.

Separate your best run from the rest—sell the best for the price that quality commands and the rest for what it is worth—and you will have more money in the long run.

Selling on the basis of grade is in keeping with the general policies of the Chicago Mercantile Exchange—whose spot call market, future trading market, grading rules, and strict regulation of all transactions having to do with the distribution of your products make it the great merchandising center for this important industry.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

On Lake Mendota's Shores

The shades of night were falling fast. In a circle around the camp fire sat a hundred boys and girls. They listened eagerly as Chief Heap Big Heart Brown, standing in the center of the circle where the fire shadows danced across his reddened face, told them fascinating tales of Indian lore.

"In this grove where you are now sitting, the Indian tepees were pitched. Here the Indian children romped and played. Here the braves made their bows and arrows with which to hunt the fleet-footed deer, shaped and hollowed out their canoes, planted their maize, and fished in the lakes. On the shores of the several lakes of Madison were many Indian villages."

Chief Heap Big Heart Brown then recited Indian legends concerning the creation, following which birch torches were passed about and lighted at the fire.

"To you, from eager hands we throw
The torch. Be yours to hold it high!"

Such were the Sunday night services held at the State Club Camp for Wisconsin's 4-H champions at Madison, June 20—24. Sunday being a holy day was celebrated as such, beginning with a sunrise breakfast in the boys' camp on the shores of Lake Mendota, followed by attendance at church; in the afternoon, a trip to the zoo; and in the evening, a band concert, and ending with the Indian ceremony pictured above.

About a hundred and ten boys and girls, including several leaders, representing twenty-three counties in the Badger State, attended the annual club short course. Among this number were more than a dozen Hoard's Dairyman Juniors, prominent among whom was Orland Baumgartner, for seven years past a member of our club. Orland has attended five consecutive annual club weeks, and expects to take up the four-year course at the Wisconsin College of Agriculture next fall. Washington County had the largest representation with fifteen.

A certain portion of the program for the course was devoted to knowledge. The boys received instruction in corn culture, animal husbandry, poultry husbandry, and grain judging. The girls received instruction in personal sanitation and health, and in clothing. Another educational feature of the program was a trip through the Forest Products Laboratory. Instruction was given by the college specialists.

Just for fun—there were many numbers on the program of this nature. Saturday evening a program was held in Agricultural Hall with 4-H club movies, a canning club demonstration by the 1923 Wisconsin champion canning team composed of Unis and Roma Horn. At this time also, acts in magic by Mr. Edward Swain kept the boys and girls mystified. Monday afternoon occurred the annual boat excursion around Lake Mendota. In the evening the boys and girls were entertained at the Orpheum Theatre by the management, and The Wisconsin State Journal. Tuesday afternoon they were conducted on a sight seeing tour through Wisconsin's two most wonderful buildings, the state capitol and the historical library.

OFFICERS OF STATE SHORT COURSE

Left to right, George B. Price, secretary-treasurer; Marie Ehmann, director; Roma Horn, president; Robert Love, vice-president.

One of the features of the course was a splendid talk by George B. Price, state poultry club champion in 1922 and 1923, who told all about his trip to the National Club Congress at Chicago last fall. The achievements of George Price, you will recall, have been mentioned on the Junior Page before. At the election of state officers which followed George's talk Monday morning, he was honored by being elected secretary of the state organization. Other officers were Roma Horn, president; Robert Love, vice-president; Marie Ehmann and Horace Fowler, directors.

Live stock judges had an opportunity to try out their skill in a dairy judging contest. Grain judges had the same opportunity in the corn judging contest. Winners in the dairy contest were: Charles Easton of Dane County, first; Harris Sterman of Washington County, second, Vroman J. Orth of Dane County, third. There were nine boys who had a perfect score in the corn judging contest. In the competition to determine the winners Earl P. Fonk, Racine County, was declared the winner; Fred Haldeman, Washington County, second; Robert Thomey, Kenosha County, third; and Victor Buvialow, Green County, fourth.

Philosopher Phil Says

Did you ever hear of the little red dwarf who lives in a cave in the side of a hill? On a Sunday morning not so long ago a preacher told all about this queer little creature in his Junior sermon.

Now, this little red dwarf has many messengers at his command which he sends out every day. Sometimes they are good messengers and bear good tidings. Sometimes they are not so good. Sometimes the bad messengers go out and never return. The cave is guarded by two shining white gates. On the hill is a radio station and the little red dwarf sends out messages from there, too.

If you have never seen this little red dwarf look in your mirror and open your mouth and see the little red dwarf who lives in a cave in the side of a hill guarded by two shining white gates. What kind of messengers does your little red dwarf send out?

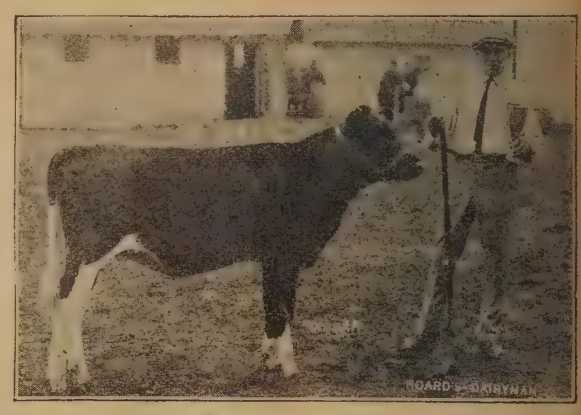
How I Won a Showman's Cup

I got my first calf in June, 1919, when I was 13 years old.

After she freshened in January, 1921, I milked her four times a day and made a seven-day official record, which was 17 lbs. of fat. I then consigned her to the state sale at Waterloo in hopes I would get a better calf. She sold for $225 and I then bought a better one at that sale. She was six months old and I paid $265 for her. She was a very good individual. I still have this heifer and her two calves.

The next year my father took four head to the Fayette County Fair. I fed them during their fitting period and took care of them at the fair most of the time. This gave me more experience in showing cattle.

Then in February, 1923, I bought a calf sired by Tritomia Pietertje Ormsby, the 1921 National grand champion bull that dad owns. Her name is Tritomia Pietertje Lass. During the fitting period, she was given skimmilk and a mixture of two parts ground corn cob meal, two parts ground oats, one part bran, and one-half part ground barley of which mixture she was given from four to six pounds a day, for she wasn't a very heavy eater, and one-half pound of oil meal until about one month before; she then received one pound per day of oil meal and two hand-fulls of beet pulp and molasses.



About a month before the county fair I started blanketing her; at first I took a bran sack, ripped it, and put it on her. Then about two weeks before the fair I doubled the blanket, and the week before I put a flannel blanket under these two bran sacks and these were kept on until the Dairy Cattle Congress.

I started to lead her when I put the first blanket on her. She soon began to lead very well; then I started making her step when I gave a little jerk on the halter strap; she soon learned what it meant and the next was to make her stop with her top line straight and her feet in the right position. This took a long time and at the county fair she wasn't trained enough yet.

Helps Dad Too

Fayette County was going to take two groups of calves to the Cattle Congress and my heifer was to be one of them. My father was taking nine head to be shown and I took care of them. It kept me very busy and every evening when they were taken care of, I would go over to the calf club tent and take her out back of the tent where there was plenty of green clover grass and let her eat.

The club calves were to be judged on Wednesday afternoon. So Tuesday night I gave my heifer some salt mixed with her feed and the next morning she received but very little to eat or drink so that she might be hungry at noon, but she had all the clover hay she could eat. About twelve o'clock I gave her a large feed of grain and a little skimmilk to drink. Then just before they were to be shown she was given enough skimmilk to make her look plump, rubbed with a woolen cloth with some olive oil on it, and her horns shined.

IRVING STEWART WON A SHOWMAN'S CUP AT THE 1923 DAIRY CATTLE CONGRESS

At one o'clock I was leading my heifer into the ring. The judge gave me 13th place out of the 63 calves shown. All the time I had kept my eyes on my heifer only and shortly after the judges were through placing, one of them came up and told me to stay in to compete as showman.

At 3:00 they finished the judging in a large yard outside of the pavil-

4-H CLUB WINNERS FROM ALL OVER WISCONSIN, AMONG THEM SEVERAL HOARD'S DAIRYMAN JUNIORS, ATTENDED THE RECENT SHORT COURSE AT MADISON

on. The winning Guernsey calf and wner were out in the center of the ard. I brought my heifer up beside er and gave a little jerk on the hal- er rope. She obeyed and stopped in orrect position with top line raight, feet in the right place, and ead up. Then the judge pointed to e and Fred Ferguson gave me the hampion Showman's Cup.

Iowa. IRVING STEWART.

Our Weekly Review

(Each week, boys and girls, in this col- mn we want to give you a little review of oard's Dairyman for the previous week. re is where we have a chance to talk it er. The Junior Editor would like your nion on this column.)

Have you discovered yet what Pro- ssor Fraser thinks is the best pas- re crop? Another one of his pas- re problem articles appeared in st week's Hoard's Dairyman, (July), and there is a third article in is week's issue.

There are other articles in the ly 11 issue which we will briefly view this week. For further dis- ssion of these turn to the articles titled "Cow Testing Associations Denmark", "Result of Careful reeding", "How Production Var- ".

When does the first waste often gin in a bluegrass pasture? In e early spring when many dairy rmers make a practice of turning eir cows out to grass too soon, us stunting the growth of the blue- ass during the entire season. In e more northern states, the middle May is usually about the right ne to turn the cows out to pasture.

Why is the grass stunted? Be- use it has been pastured too close the ground. This is just like get- g a boy completely tired out and ver giving him a chance to rest. obtain the best pasture, the blue- ass should be allowed to get up ree or four inches high in the ring before the cattle are turned t and allowed some growth in the l before winter sets in.

How long should it take a cow to up on bluegrass pasture?. Cows ould not be required to eat more an one hour at a time to fill up full, that they can and will lie down d chew their cud for some time. cow that has to tramp the pasture ht and day to get enough to eat n not possibly produce economi- ly.

What should you do when the pas- e gets short? Give them some ra feed so as to keep them in good h. "Even in the best dairy re- ns," says Mr. Fraser, "over half cows are too thin most of the mmer because of the lack of prop- and sufficient feed.

Where, when, and by whom was cow testing association idea orig- ted? It is generally understood t the cow testing association idea s originated and put into practice the Danish farmers in the year 5. In that year the farmers of th Jetland in Ribe County, fol- ing the suggestions made by Mr. ls Peterson, formed the first as- ation. The original plans were so efully developed that there has been great change in them even today.

low large are the cow testing as- ations in Denmark? There are about as many farms in a cow ing association in Denmark as re are in a cow testing association the United States. Because the ns are small and nearly every n has cows, in many of the asso- ions the tester does not have to el more than two or three miles each all the herds.

low long does a cow testing asso- ion operate in Denmark? The ish farmer feels strongly the val- f continuous testing. There are y associations now operating in Denmark that have been running from ten to twenty years.

When is the most butter made? Cheese? Ice Cream? Condensed Milk? The highest period of production for these four principal manufactured dairy products comes in the summer months from May to August inclusive. Butter is the most important, using four times as much milk as the other three dairy products combined. The most butter, most cheese, and most condensed milk is produced in the month of June, while ice cream reaches its peak of production in July. (See article "How Production Varies".)

How did the Nebraska College of Agriculture develop its present herd of Holsteins? Practically all of the herd has been developed from one cow, Karen II, who was bought about a quarter of a century ago. One of her daughters, Katie Gerben, made the world's record when she was three years of age, and is considered the foundation cow of the herd. Through careful breeding and keeping a close watch over the blood lines of ancestry, this herd has been developed until in the year 1923 all of the Holstein cows in the herd, numbering twenty-three, produced an average of 15,626.7 lbs. milk and 565.1 lbs. butterfat.

Junior Letters

From a Mexican Junior

Hoard's Dairyman Juniors:—We keep Jersey cows and make butter, feeding the skimmilk to the calves, pigs, and chickens. We have 22 cows, 6 grades and 16 pure-breds, also have some pure-bred heifers and young bulls. I have a brother seven years old and a sister five years old; all three of us are going to a Mexican school since New Years. Before that mother taught us at home.

We are the only Americans in Silao but it is only a few miles from here to Guanajuato mining camp where there are about 30 American families living.

Hoping to hear from some of the juniors and to learn if there are any members living in Mexico. My address is Silao Gto, Mexico.

Rachel McBride.

Another Junior in Australia

Hoard's Dairyman Juniors:—I would like to become a Hoard's Dairyman Junior, and enclose herewith the membership coupon, provided you will enroll members resident in Australia. My father is a subscriber to Hoard's Dairyman and I enjoy reading the Junior page. I live on a 250-acre dairy farm, which is 6 miles from the township of Toogoolawah, where Nestles & Anglo-Swiss condensed milk factory is situated, which employes 300 men when in full swing.

My father is a Friesian breeder and at present there are about 60 head on the farm. I have a two-year-old heifer with which I won first prize at the Brisbane Royal National exhibition in the junior calf class. I also have a heifer calf from her with which I hope to win some prizes this year.

Should you enroll me as a member I shall be pleased to correspond with the juniors, meantime I will await your reply. My address is "Burnbrae Friesian Stud", Toogoolawah, Queensland, Australia.

P. R. Alexander.

Story of Blossom

Hoard's Dairyman Juniors:—My papa joined the testing association. Harry S. White, our tester, asked my brother and me to join the calf club. So I talked it over with my papa, and he decided to let me join. So my papa helped me select my calf as we only had grade Guernseys. I thought I would try for fun, just to see if I could win a prize.

Mr. Stegner, our county agent, came here to look at my calf. He thought I had a very nice calf to start with and with the help of Mr. White I started in to feed my calf the first of May.

I mixed oats, corn, and had that ground together, then I mixed oil meal and bran together and fed this three times a day and four quarts of milk twice a day. I brushed her once a day and washed her once every two weeks.

In August, Mr. White and Mr. Stegner had a calf show in Houston. There were eight girls and seven boys that took calves to the Houston Calf Show that day. I won first prize and champion in the Houston calf show. And then I took her to the Houston County Fair at Caledonia and won first prize and sweepstakes over all breeds that day, and that gave me a chance to go to St. Paul with my calf, and I also received a prize up at the state fair, too. I sure saw some wonderful things at the state fair, although I had quite a bit to do. I had to take care of my calf every morning.

When we were in St. Paul we went through the state capitol and the agricultural building where there were school exhibits and other things, and then went through the fish hatchery and in the evening we went to the banquet.

We also went to see the blind people read and work, and from there we went through the Red Wing and Montgomery buildings. Friday night we had our picnic supper in the National park.

I went to hear speaking and spelling contests in the Agricultural building and the dairy demonstration which was at the main building.

I received $44 in prizes on Blossom.

Mildred E. Halverson.

Hard Luck, Soft Pick'en

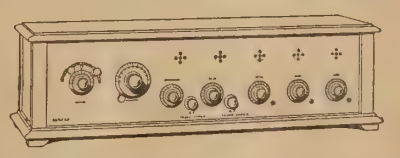
The Hoard's Dairyman paper has come on the train,
There were to meet it Vern, Lloyd, and Shorty Wayne,
This was the gang which hoped to win
By receiving in mail the Junior pin.

The pin did not come, I'm out'a luck—
Then running and grumbling like a duck,
A week ago I sent the letter and it isn't here yet,
Don't worry, boys, other fellows the same trouble have met.

The eleven twenty train is in,
I'll raise a rough-house about my pin,
By gee, there's a letter for me in our mail,
The Hoard's Dairyman paper never fails.

I'm an owner of a badge, pin, and creed,
I'm among those who take the lead,
No other society, gang, or club
Comes up to the "Hoard's Dairyman Juniors' Club".

Middleton, Wis. John M. Hilgers, Age 12.



How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

Wanted—Young man, married preferred, to handle cows and run retail milk route where Ford truck is used. Write for particulars. Give references. JAMES S. D. CUMMING, Hampton, Virginia.

Wanted—Married man competent to take full charge of a twenty cow dairy, registered Holsteins. O. V. BELL, Bellefontaine, Ohio. 1-2

Wanted—Married man to live on farm, charge milk room, wash bottles, bottle milk and make buttermilk. PLAUT DAIRY FARMS, Danville, Ill.

Competent Working Foreman Wanted—Dairy Department of a County Institution in Western Pennsylvania requires the services of a middle-aged man, preferably married, to take charge of an accredited Holstein herd of approximately 125 head, all registered. Must be experienced in the production of clean milk all of which produced by the herd is consumed in the institution. This is a splendid opportunity for someone willing to work hard to make something of the herd. Excellent living accommodations are offered and a fair salary to the right man. Send references and full details in first letter. BOX 204, care Hoard's Dairyman.

Wanted—Working herdsman to take charge of Jersey herd and handling of milk. Address stating wages, "ROSE WAY FARMS", N. A. Pierce, Mgr., Paoli, Pa. 1-2

Wanted—Experienced milker and dairy hand on pure-bred Guernsey farm. WYANET FARMS, R. 6, Davenport, Iowa.

Wanted for a first class dairy, clean well educated boys, first class milkers, knowing their business. Good pay and fine position. Address MANAGER, Robins Nest Farm, Oak Hill, Peoria, Illinois.

Eight testers wanted before August 1st for one year in Cow Testing Associations. Prefer single men over twenty-one years, having Short Course or herdsman training. Tell experience in dairy cattle feeding and operating Babcock tester first letter, with salary $75 to $80. Write CRAMER, Dairy Records Building, Madison, Wis.

Wanted—Married man, middle-age, with help to run farm and dairy. We have all pure-bred Ayrshires. Man must understand dairying. Good opportunity. AYRSHIRE BREEDERS' & DAIRY CORP., S. S. Hess, Manager, Freeland, Pa. 1-2

POSITION WANTED

Wanted—Position as milk wagon driver on retail route. Address BOX 194, care Hoard's Dairyman. 26-2

Young man wishes work on dairy farm. Experienced in all farm work. W. E. RAWHAUSER, Elk Mound, Wisconsin. 26-2

Position wanted by married man with small family. Experienced with Holstein and Guernsey cattle and general farm work. State wages and particulars. Address BOX 203, care Hoard's Dairyman.

Married, working manager open for proposition between now and September 1st. At present am manager of large wholesale and retail routes and farm also. Understand how to produce any kind of milk and am a No. 1 herdsman. Reason for leaving here, changing hands. State wages and full particulars in first letter. WILLIAM HENRY, Gilman, Ill. 1-2

Position Wanted—Experienced dairyman, forty. Clean habits. $60.00 per month and board. Reference. Address BOX 198, care Hoard's Dairyman.

Manager—Herdsman—Graduate veterinarian. Married, wants place where training and experience with Holstein-Friesians can be used advantageously. C. H. ROSENSTIEL, 419 Saxby Ave., Freeport, Illinois.

Position wanted in dairy by single, middle aged man with life experience. Familiar with Sharples milker and all farm machinery. Also experienced in cheese and butter making. State wages paid. Address BOX 185, care Hoard's Dairyman.

Position Wanted as manager dairy farm Illinois or Wisconsin preferred. Age 26, single, life experience and 2½ years agricultural college work. Have been managing 360 acre farm since leaving home and can give reference from owner. Ready to start work August 1st. A. G. PARKER, 920 Leland Ave., Chicago, Ill.

Manager—Graduate Veterinarian, of stock farm or dairy. Experienced in all branches of dairying and swine husbandry. Bigger the proposition the better. Married, 34 years of age. Open for position August 15. References exchanged. Address BOX 201, care Hoard's Dairyman. 1-2

Middle aged man and single wants place as dairy herdsman. 20 years' experience. WM. CARLEY, The Northern Hotel, Rochester, Minn.

Married man wants position, modern dairy. Can take charge. Dry hand milker. Operate milking machines. West preferred. Address BOX 199, care Hoard's Dairyman.

Married man with good references wants position on private place or farm. Good gardener or farm hand. Further information by letter. Address BOX 193, care Hoard's Dairyman. 26-2

Working Manager—Herdsman, married, small family, wants a position on or before Sept. 1. Lifetime experience with pure-bred cattle, thoroughly competent to do official testing, short or long time, fit and show, raise calves, make grade A milk and butter. Understand modern farm methods and machinery. Wife excellent cook, willing to board men. Full particulars first letter. Address BOX 207, care Hoard's Dairyman.

Position as manager or foreman on dairy farm wanted by middle aged married man. No objection to working position. Thoroughly experienced, good reference. Herd and equipment must be good. Address BOX 206, care Hoard's Dairyman.

Position wanted as herdsman with good dairy herd. Married, agricultural college graduate, experienced. Open at once. Any good livestock or poultry proposition considered. Address BOX 205, care Hoard's Dairyman.

Want position on farm where dependable, experienced man is needed. Life experience with all live stock, the growing and harvesting of crops. Can successfully operate all modern farm machinery. Five years with tractors and milking machines. Not afraid of work and shall work for your interest. SAMUEL CALLOW, JR., Waukesha, Wis.

Position Wanted—As manager of large, modern dairy farm by midle aged married man thoroughly experienced, 16 years on farms in Illinois, Michigan and Maryland. Present employer is selling out. Will be at liberty about October 1st. Have three experienced men with me. Can produce Certified or Grade A milk. Nothing but a first class proposition will be considered. Best of references. G. E. EMSTROM, Whitehall Farm, Elkton, Md.

UNION PACIFIC SYSTEM

Dairy Development

is going ahead faster in some of our Western States than in others, because in such States the fact is recognized that those districts in which dairying and balanced farming are carried on, extensively, prosperity reigns; that, although those lines of endeavor mean continuous employment, a steady stream of cash flows in.

Idaho offers exceptional opportunities to "dairy-minded" persons, and, if you will drop me a line, I'll be glad to send you, absolutely FREE, a copy of our illustrated folder entitled, "Dairying in Idaho." Ask me for information covering Round-Trip Special Homeseekers' Excursion Fares, in effect March 4 to November 18, 1924.

The Burro and the Bull

HOARD'S DAIRYMAN:—We all know that bulls of any breed are vicious. We also know that you can't "buffalo" a bull. One of my neighbors said to me one day: "I have my bull buffaloed. He is just plumb scared to death of me." I replied that I never saw a bull that was afraid, only temporarily, of anything and for him not to put any confidence in that scare. About three days afterward that "buffaloed" bull attacked my neighbor and had he not fallen

This is a three-year-old bull. He and the burro are just "thinking it over". Do not hitch to ring at start, but put a rope around bull's neck and run it through ring till bull gets so he will lead, otherwise he may break ring or pull it out.

into the manger and made good use of his pocket knife around the bull's eyes he would not have escaped.

J. N. Heywood and myself shipped in a Guernsey bull calf some years ago. When he was about three years old he became very vicious. Could not drive him out of the pasture on foot, could not keep him tied up all the time, couldn't safely breed him either in or out of a bull pen, but he had to have exercise.

Since I had had a life of experience handling range cattle, I usually handled him on a good saddle horse; but that was not satisfactory since it took time just when I wanted to do something else. That bull tore down good fences, helped me over the corral fence when I got to it just before he did, got the hired man down, and it took three of us to get them loose from each other. He just kept up a general cyclone scare on the place all the time.

Finally I got an old, slow burro and took a little chain about three feet long with two swivels in it and a snap on either end. I put a wide strap on the burro's neck with a ring in it. Then I necked the bull and the burro together. You should have seen the fun! A burro hates to be necked to a bull. A bull hates the burro just as bad. I think they put in about the first three days sulking, fighting, and being agreeable by turns before they seemed to come to an understanding. Then it seemed to be settled that wherever the burro went the bull would go also.

One of the neighbor's bulls came down the fence line (and a good fine wire fence it was too) and invited our bull over to a fight, which was immediately accepted. Of course the arrangement was perfectly agreeable with the burro and the fight came off. Those bulls tore down the fence, got the burro down, walked on it and dragged it about until I could get to them and run the other bull away. Well, that taught the burro a lesson. It would never let that bull go over the fence when another bull was there. She led right off in another direction. If Mr. Bull objected she would kick him in the side; if he tried to go around her she bit him on the ears, or brought him up standing, turned him around and started off again.

I could go down in the pasture and rub that bull on the sides. He would make an awful fuss about it but he couldn't hurt anything.

When breeding to a cow, reach over the burro's back and snap your lead chain or rope into the bull's ring and loose him from the burro. When you get ready to take him away from the cow, run the rope through the strap around the burro's neck and pull the two animals together, reach over the burro's back and snap your necking chain into the bull's ring. He can't possibly hurt you. He can't serve a cow while properly necked to the burro, but while in the corral or pasture he certainly will behave himself.

Arizona. EVANS COLEMAN.

Putting Shoes on Bulls

Some Arizona cattlemen are providing their bulls with shoes to protect their feet from the rough rocks of the mountain ranges. The department reports that the shoes are similar to those worn by oxen used for road work. Cattlemen say that heavy bulls brought to Arizona from the soft ground of the Middle West are slow to get their feet hardened to the rocky slopes on much of the Arizona range, with the result that the animals stay around the water holes in the valleys and get little to eat.—U. S. D. A. Official Record.

A Maryland Champion

Delilah Jewel Canary Repeater is now the state's leading cow for ten months' production as a junior four-year-old with a record of 16,547.1 pounds milk and 576.36 pounds fat—equal to 720.4 pounds butter. She is owned by the Sykesville State Hospital.—Holstein-Friesian Ass'n of America.

A reproduction of No. 17 of the Graham Brothers Series on "American Industries", as published in the Saturday Evening Post of July 12, 1924.

Riches of the Soil

More than a third of America's population is engaged in farming, and half of all her land is farm land.

There is no industry of comparable magnitude; no nation that derives such vast riches from its soil. Farming is the foundation of America's wealth, the bulwark of her power.

The value of our farm production in 1922 was $14,310,000,000. Cereals, grains, cotton, tobacco, sugar, rice accounted for $8,580,000,000; animals, $2,580,000,000; dairy products, $1,150,000,000; vegetables, $850,000,000; poultry and eggs, $720,000,000; fruits, berries and nuts, $430,000,000.

One of the most important needs of the modern farmer is dependable transportation. Graham Brothers Truck supplies this need to a maximum degree. Its exceptional sturdiness and unusual power adapt it particularly to the arduous task of country hauling. There is a standard body for every purpose—and a Dodge Brothers service station within easy reach of the remotest farm.

1 Ton Chassis, $1265; 1½ Ton, $1325; f. o. b. Detroit

POULTRY On The DAIRY FARM

J. B. HAYES

Summer Management

Development is primarily a strain characteristic. Although one will expect the smaller fowls to mature more rapidly than the large breeds, there is still a distinct difference in the rate of development within the breed. Improvement along this line can be inaugurated by a continued cull on all young and growing stock that tends to grow slowly or display evidence of lowered vitality. Birds of this class will generally not develop into highly profitable producers because they are lacking in what is necessary to lay and be kept at a profit.

One can be reasonably certain that it is time to stop, look, and listen when a high percentage of chicks appear in a flock that do not feather out rapidly but remain bare and sunburned all summer. These chicks may look good, in so far as physical appearance indicates, but there is something wrong That class of stuff does not develop into the highest production line.

Twisted wings are another manifestation of the same thing. Most of that kind should be utilized as market stock and not saved for breeding. At the same time one should arrange for the introduction of a new line of breeding to increase the vigor.

Chicks cannot be neglected during any stage of their development if success is expected. The growing season is entirely too short at best and every day is required for proper growth and an early production. There is a possibility of overdoing this just a little on the part of some of the better feeders. When matured too early, one will encounter a late summer lay and a consequent early winter molt.

The few instances when this has happened has been broadcasted so thoroughly that more people are getting scared of the cars and stopping their work too soon. In other cases the young stock has been pushed until well into the summer when mature development was noted and the brakes were applied.

A safe procedure to follow includes pushing the early hatched chicks in a normal manner and the late hatches as rapidly as possible until they reach broiler age. At that time a gradual change can be made in the ration by decreasing the amount of animal protein that is fed and a slower growth will result. The changes must be made gradually to prevent causing even a greater damage.

At the time that the stock is developed, or development is desired, one can increase the animal protein content of the dry mash. There isn't any other form of feed that will finish and mature stock without causing any damage.

Not half enough corn, grain, and hay fields are utilized for poultry as they should be. Too many farmers use a house mounted on a permanent foundation for chick rearing. This arrangement means that the young stock inhabits the same range year after year in company with the old stock. When a small portable house is used it can be pulled from one field to another as the season progresses with a cheaper, better growth on the chicks resulting.

About the nearest thing to an ideal range is an orchard in which the grass is cut to keep the green feed tender or a location adjacent to a corn field for a cool, shady range and a seeding for green feed. Very little feed, aside from the dry mash, is required when young stock can forage over a field from which the grain has been harvested.

Any number of conditions can result from an insufficient quantity of green feed. Late in the season when the ground around the house becomes bare and the grass is dry and tough, one should cultivate the bare sections and seed to oats, barley, or rape. Green feed has been one of the neglected items on the menu.

If portable colony houses are used one should have them elevated about a foot. The space beneath the houses allows for shade for the chicks in a cool place and prevents, to a great extent, the harboring of rats.

All of the males should be separated from the females when weighing about one and a half pounds. When both sexes are permitted to range together, a slower growth is experienced. A second and more important reason for selling the males as early as the market will permit, is a greater profit. Cockerels are a necessary overhead that should be unloaded just as soon as possible while the price is holding. One can never be certain about market quotations but early broilers are high in price and can be sold to advantage with a rather low production cost for feed. The longer they are held, the higher the investment becomes, unless a rapid gain in weight is accomplished, and a fall price on a five-pound cockerel may not be any more than the early spring price that was obtained for a pound and a half broiler.

Incubator Chicks Die In Shells

Please inform me why incubator chicks die in the shell and what is the cause of same. Any information you can give me will be highly appreciated.

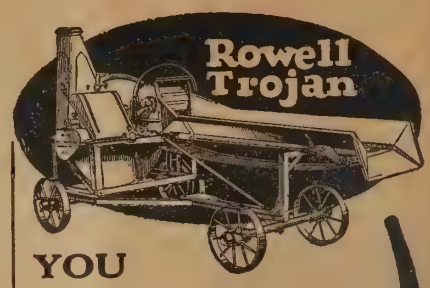
Donaldson, Ind. (Mrs.) J. F. S.

There are a number of reasons for chicks dying in the shells. We have rather believed that this was primarily caused by the matter of individuals. That is, so far as we have gone at the present time, we find that in the pedigreed stock there are certain hens that will give a high percentage of fertile and hatchable eggs, while another bunch is very low in the hatchability of their eggs. This is one of the factors that has been used in the building up of our production strain.

Oftentimes the incubator may be at fault, and we have found that using an excessive quantity of moisture in our machine especially later in the season is good and have also had reports from others stating that the addition of moisture to the machine has resulted in improved hatches. This is plausible when one stops to consider that the membrane which lines the interior of the shell when dried out becomes very tough, hard, and resistant and rendered almost impossible to break apart, while if they are soft, it is very easy to tear them. We have supplied moisture by taking the egg trays out on the seventh, the fourteenth and the eighteenth day, sprinkling them with warm water, and in a great many instances have placed wet sponges in the egg chamber from the eighteenth day on to keep a constant supply of moisture. A film of water on the glass in the door or at least in the two lower corners seems to indicate the most satisfactory hatching conditions that we can wish for.

It is undoubtedly true that lowered vigor and vitality in the flock will cause lowered hatchability because this is closely associated with incubation. The suggestion at this time would be to try the moisture in the machine and see if it wouldn't improve the hatch, and if that is not true to check up on the breeding of the flock to see that either inbreeding or line breeding has not been carried to such extremes that the vigor and vitality of the flock is seriously affected.

As I stated, this question of hatchability is still an open subject; there is a great deal of controversy being carried on at the present time concerning it and no real research work has been done that would give one definite ground on which to act.



Wisconsin Poultrymen

The dates for the summer meeting of the Wisconsin State Poultry Breeders' Association at Madison, Wisconsin, have been tentatively set for July 25 and 26, 1924. All meetings will be held at the University poultry building and a large number of attendants are expected because of the many important subjects that will be discussed.

The out of state speakers include Professor L. H. Schwartz of Purdue University; Professors Kempster and Winton of the University of Missouri; Professor J. Holmes Martin of the University of Kentucky. Recent investigational work on baby chick feeding and diseases will be discussed. Special emphasis will be given to white diarrhea. Demonstrations will be given of how the white diarrhea blood test is made and reports will be made of experiments now in progress with this disease at the Wisconsin College of Agriculture.

Milk Record Sheets

For years Hoard's Dairyman has been preaching the necessity of keeping records of the production of each cow. Only by knowing how much milk each cow actually gives is the dairy farmer able to improve his herd. Our Book Department has various sizes of milk record sheets to make it easy to keep tab on your cows. Complete samples with price list will be sent for 5 cents in stamps. Address Hoard's Dairyman, Fort Atkinson, Wis.

YOU Already Own Half of This Outfit

If you have an 8-16, 9-18, or 10-20 H. P. tractor—you already own the most expensive half of a Rowell Trojan Ensilage Cutting Outfit. And the other half—the ROWELL TROJAN ENSILAGE CUTTER—will pay for itself in a few seasons through profitable custom service among your neighbors as well as through its saving of time and labor producing your own silage.

Hyatt Hi-duty roller bearings; rugged, twist-proof steel main frame; guaranteed-for-life steel flywheel; true-cutting, easily adjusted knives; end-thrust bearings that take up play; automatic feeder (no one required at feed table); full-blast blower that lifts into the tallest silos—these and other exceptional features are assurance of 100% service for the longest time at the lowest cost.

Write for free booklet which describes the Rowell Trojan Ensilage Cutter fully.

PAPEC
Throws And Blows Saves One Man
The Biggest Value in Ensilage Cutters

THOUSANDS of farmers agree that the Papec is the biggest value in ensilage cutters—simple, rugged, long-lived. Fills the highest silo without plugging the pipe. Light of draft; costs less to operate. Every part is easy to get at.

The Papec is made in four sizes: R-10; N-13; L-16 and K-19. A gasoline engine, developing 3 h.p. or more, will operate the R-10 size. Any tractor can be used with the medium sizes. For heavy tractors use a K-19 Papec—capacity practically unlimited.

Write for free catalog and U. S. Gov't Bulletin "Making and Feeding of Silage." Every silo owner should read them. Mention size of your silo.

Papec Machine Company
116 Main St.
Shortsville, N. Y.

Cut Clean and Even Ensilage WITH A CLIMAX Ensilage Cutter

The inward shear cut is an exclusive CLIMAX feature and assures an even, clean cut ensilage. Cuts and elevates with one operation. Control lever is close to the operator to stop, start or reverse both rolls and feed chain in a moment.

Write today for free catalog describing exclusive CLIMAX features.

CLIMAX CORP., 42 Swan St., Batavia, N. Y.

Hoosier WOOD SILO

Prompt delivery from stock at special low prices. Yellow Pine or Oregon Fir, the World's standard material for best wood silos, with or without hinged doors. Best anchoring system on market. HOOSIER WOOD SILOS cost little to erect, give splendid service with least upkeep cost. Purchase NOW insures quick shipment at rock bottom prices. Write for illustrated descriptive literature. Special proposition to agents. We sell also famous Hoosier Tile Silos and Building Tile. Ask for circular.

Hoosier Building Tile & Silo Co.
Dept. K-5 Albany, Ind.

GEHL

Better Ensilage - Lower Costs

The clean shear cut, large capacity, safety and economy of the GEHL cutters will win your everlasting approval. Has heavy steel frame, easily adjustable length of cut, *boiler plate flywheel and all gears are in an oil-tight case running in a bath of oil.*

Light Power Requirement

In the Wisconsin University Tests the GEHL Disc Type machine cut and elevated into the silo at the rate of 16 tons per hour with 16½ h. p. This proves that *any light two-plow tractor can run it successfully at full capacity.*

Absolutely Self Feeding. No man is required at the feed table. Saves one man's wages every day. Means faster work at less cost. *Cylinder or Flywheel Types.* Give us the height of your silo and size and name of your engine and we will tell you about the right size Gehl cutter for your requirements.

How's This for a New Name

Bixley's Garage, Hammett, Pa., writes: "I sold two of your size B Flywheel cutters last year and I must say that they are the best cutter or cutters I ever sold. I have sold the ——— and the ——— and will say that they are not in it with your cutter, smooth running easy to control, some of the best adjustments a cutter can have—give no trouble whatever. Can't clog. You should call it the "Can't Clog"

All Gears Running in Oil.

Gehl Bros. Mfg. Co.
507 S. Water St.,
West Bend, Wis.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Difficult Urination

It is comparatively common for steers to have difficulty in urinating. In some cases urine is wholly suppressed and the cause is mechanical blocking of the urinary channel (urethra) of the penis by a particle of gravel or small stone from the bladder. In other and more usual cases the difficulty is due to a collection of clay-like or gritty sebulous and limy substance in the sheath and coagulated on the hair at the orifice of the sheath. When a gravel or stone blocks the urethra, death will soon result from rupture of the bladder unless relief promptly is given. In a wether or ram death from rupture may occur in 48 hours; an affected steer may live longer in that condition. Text books advise locating the stone and removing it by cutting down upon the penis, opening the urethra, and extracting the offending body with forceps. That sounds easy or feasible, but in practice it is by no means a simple operation and, indeed, often is impossible of accomplishment on account of the extreme fleshiness of the overlying parts.

It is likewise almost impossible to pass a catheter far into the urethra of a steer or bull, as there is an S curvature which prevents passage of the tube. An expert may be able to stretch the penis and pass the catheter on a long, slim, flexible sound or probe to locate the lodged stone; but that seldom happens. If removal of the stone by such operations fails it is still possible to save the life of the animal by cutting into the urethra where the penis bends over the brim of the pelvis just under the anus. That lets the urine gush out and the steer may then be quickly fed off for slaughter. In some instances, where the urethra has been so opened and the urine has escaped from the bladder, it has been found possible to pass a catheter or probe downwards and possibly dislodge the blocking substance, or locate it and remove it by cutting or even passage of a slim forceps, but these cases are the exception. It is an easy matter, however, to remove the substance that blocks the sheath and then to syringe out the part with a 2 per cent solution of permanganate of potash, after clipping off the hair, and then to apply an ointment of iodoform and lard or vaseline.

Cows sometimes have similar difficulty in urinating and when the urine is suppressed show great distress indicated by colicky pains, kicking at the belly, getting up and down, straining and arching the back to urinate, with the urine coming in spurts or a constant dribble. Examination of the vagina discloses presence of a collection of substance similar to that found in the sheath of the steer and blocking the little pouch cul-de-sac or diverticulum found just at the entrance to the urethra. It is not a difficult matter to break down and remove the blocking mass by syringing with warm water, manipulation with the fingers, and use of a scoop or forceps. When it is removed urination is at once effected and the cow may have no further trouble. The examination, by hand passed into the vagina, should always be made when a cow shows distress in urinating. Less rich meal and more laxative and succulent feed should be given following the operation.

Tumor in Udder

I have a fine Jersey cow that three weeks or more ago had a lump come upon the back part of the udder, like some of the other cows had hooked her, but there were no bruised places on the udder nor any sign except the knot and I applied some liniment but it did no good except take away the soreness. Knot is still there and would like to have it removed.

Mercer, Mo. B. B.

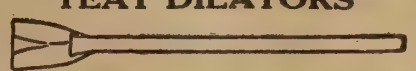
When a hard "bunch" or tumor forms high up in the rear of the udder it always is well to have the tuberculin test applied by a veterinarian, as tuberculosis may be causing enlargement of a lymphatic gland. If that disease is present it is incurable and contagious and also makes the milk dangerous for use by people or animals. A tumor such as you describe may also be caused by a bruise from a horn thrust, or some such injury, or to an attack of mammitis or garget. Until you can have the test applied by a veterinarian rub a little ointment into the enlargement at intervals of two days and if that does no good try the effects of mercurial ointment rubbed in two or three times a week, but keep it out of the milk as it is poisonous. If the cow reacts to the test she will have to be disposed of in the manner prescribed by state law which the veterinarian will explain.

Preventing Milk Fever

Please tell me if there is any particular way to feed or care for cows before calving time which would prevent milk fever.

St. Johns, Mich. R. H.

A susceptible cow will be much less likely to have an attack of milk fever if "dried off" for at least six weeks before calving and during that time is fed a light, laxative ration and made to take daily outdoor exercise. Avoid pasturing such a cow on lush green grass or clover. Let the new born calf nurse for 3 or 4 days, or during that time only strip out enough milk several times a day to prevent garget. Letting the calf nurse is the better plan. Also feed very lightly for the first week after calving.



Garget

Please advise about cow freshened 30 days ago. One quarter is caked and not much milk comes from it. Am afraid she will lose it. Please give treatment for it.

E. Liverpool, Ohio. E. D. W.

Isolate the cow and strip the quarter clean once an hour during the day. In the evening rub in a mixture of equal quantities of carbolized oil, camphorated oil, and compound soap liniment and mix in the feed one tablespoonful each of powdered poke root and saltpetre. If possible have a veterinarian give hypodermic treatment with mastitis bacterin. It is to be feared, however, that the affected quarter will lose its normal milk producing function.

MEDICATED WAX TEAT DILATORS

For sore teats, obstructions, Spiders, Hard Milkers, etc. 25c per doz., or 5 doz. for $1.00, postpaid. MOORE BROS., Dept. H, Albany, N. Y.

Ever Failing or Never Failing Pasture

(Continued from page 5)

to men who had had experience pasturing alfalfa, and received 30 replies giving the results of pasturing 350 acres with 600 cattle. Only six of these men had any difficulty in keeping a stand of alfalfa, so it is apparent that this is no serious objection. Bloat occurred in ten herds, however, or about one-third of the total number. The men who did not have trouble on this account said it was due to the fact that they gave the cattle a full feed of their usual ration just before turning them on the alfalfa, and never took them off more than an hour or two at milking time. Two of the men who had trouble said that they prevented further trouble by giving the cattle a full feed just before turning on. Others said a supply of straw or hay in the pasture would prevent bloat as the cows crave some dry feed on this very succulent pasture, and eating some dry roughage with the green alfalfa prevented bloat. Alfalfa is even more likely to cause bloat after it is frosted in the fall.

In a two years' test of pasturing alfalfa at the University of Illinois, no bloat was experienced. To prevent it, the cattle were given a full feed before being put on pasture, turned on when the alfalfa was not wet from dew or rain, and kept on constantly day and night

In Kansas and adjacent states, it is the practice to turn all classes of live stock upon alfalfa pasture, and many men there seem to be able to handle their alfalfa pasturing with no bad results from bloat.

Several other dairymen besides the 30 reported above have been interviewed on pasturing alfalfa, and it must be said from all the farm experience known that whatever the precautions taken, there is some danger of bloat. This loss or possibility of loss is so serious that pasturing alfalfa cannot be unreservedly recommended, although its dangers may be very greatly reduced by observing the precautions mentioned.

There is, however, another legume pasture crop of equal if not greater feeding value and without the bloat danger—namely, sweet clover. It is very economically produced, and it is an excellent supplement to bluegrass. Its merits will be discussed later.

HAMPSHIRES

Spring Pigs $20 each —$37.50 per pair. From Famous LOOK-O U T-WICKWARE Bloodlines. Either Sex. Cholera Immuned. Bred Sows and Gilts for September Farrow. Write for further information.

ROLLA OLIVER, Route No. 5, Independence, Mo.

You Need a Better Bull

Did you ever stop to think that the choice of a herd sire will likely make or break you in the dairy game. If you pick a good one, the price you pay is of little consequence and if you pick a poor one, you pay too much even if you get him for nothing. The great sires of tomorrow are being offered for sale today. The place to find them is in the herds that are making the big production records. The Sherman Jersey Farm is one of those places. In two years, it has made 40 R. O. M. averaging 516 lbs., won two Gold Medals and six Silver Medals and produced the Champion Jersey of the Middle West with a record of 1019.73 lbs. fat. If your herd is not doing as well, you need our latest price list just off the press. Write for it.
HERD ACCREDITED. SHERMAN JERSEY FARM, Charles City, Iowa

Selecting Animals for the Dairy Herd

(Continued from page 3)

animal, for capacity of barrel, for evidence of constitution, for size, shape, and quality in udder, for a straight, strong back and rump, for a shapely head with prominent bright eyes and a large muzzle and finally for a proper balance of these important points coupled with a lean, rather angular appearance known as dairy temperament. In addition in selecting cows or heifers it is desirable to get all the information one can of sire and dam of the animal or animals under consideration. This is especially important in the case of calves and heifers. If the sire is well bred and dam a good producer, the heifer will probably develop into a good cow but this is not infallible. Her work in the very first lactation period should be carefully checked in order that her present and probable future usefulness may be known.

Selecting the Sire

Sire selection is a matter of outstanding importance to the dairymen. The dairy herd is constantly changing. Animals are continually dropping out through disease, accident, or old age or are removed because of inferiority. On an average there is a loss in number of 18 to 20 per cent yearly. Replacement must be through purchase or by raising heifer calves. Good cows for sale are not plentiful and most dairymen must raise a sufficient number of heifer calves to maintain the herd. The usefulness of these calves to him as milk producers at maturity and their type or beauty of form is determined by their inheritance. Dairymen can control inheritance through selection of breeding animals. The sire is of first importance because his individuality and inheritance are transmitted to every animal born in the herd.

The future herd is dependent upon the breeding work of the present. The herd will improve in working ability and value or go backwards just according as the sire possesses and transmits good or poor qualities. Through selection the dairyman can control type and production in his future herd.

The safest method in sire selection is to choose a proven sire. By a proven sire we refer to one that has daughters in milk that carry the type desired and that are uniformly good milk producers. A sire continues to get the same general type of animals as long as he lives. By selecting a proven sire the dairyman eliminates much of the chance in breeding and thus insures the future.

Unfortunately, however, most sires find their way to the block before their qualities as breeders, either good or poor, have been demonstrated. The dairyman then must make his choice from among young, untried sires. By careful, intelligent selection he can still eliminate much of the uncertainty. The old adage "like produces like" must ever be kept in mind. Select a bull of the breed desired, of good type and from a dam, grandams, and families of good type and of proven high milk producing ability. Bulls inherit the milking qualities of the cows from which they came and pass these qualities on to their heifer calves. Study pedigrees and milk production records very carefully. The dairyman's whole financial future is at stake when selecting a sire. A good sire may increase production in the herd 50 to 100 per cent. An inferior one may decrease it by an equal amount.

Purchasing Sires Co-operatively

The cost of a good registered sire often seems prohibitive to the man with a small herd. Where conditions such as this prevail two or more neighbors often combine in the purchase of a bull. Where there is community interest in better sires a bull association may be organized to purchase three or more bulls thus providing, through exchange, for several years' service. Through partnership or association ownership of a high class sire, the cost to the individual is often much less than ownership of an inferior or scrub animal. The county agricultural agent in any county can supply particulars regarding association purchase and exchange.

Dairying is an important industry and seems destined to increase in importance as time goes on. Dairy products are essential to human welfare. Good dairy cows well fed and handled have always been money makers for their owners. The future holds no thought of fear for the dairyman with a herd of cows possessing good working ability. To maintain and increase efficiency in the herd the dairyman must ever be selecting animals through keeping records of production of his cows, weeding out the poorer ones, and replacing each successive sire with one of greater merit.

Dam—a 22.38 lb. 2-year-old, 615 butter, 16000 lb. milk in 305 days and now making 26 lb. in 7 da. as 3-year-old. One of 29 A. R. O. daughters of King Segis Pontiac Fayne Star, the best proven son of "COUNT". Price $350.00. Write for photo and pedigree.
CARLETON COLLEGE FARMS, NORTHFIELD, MINNESOTA
Federal Accredited Herd.

Grahamholm Herd

We are using Dutchland Creamelle Colantha Lad and Duke Pietertje Korndyke Ormsby on our select herd of over 100 females. We have a few serviceable sons and grandsons of "Dutch" and some of "Duke" for sale; also some calves that will soon be ready for service.
GRAHAMHOLM FARM,
D. G. Twentyman, Manager Rochester, Minnesota

Fond du Lac Co. Holstein Association

OFFERS GOOD HOLSTEINS

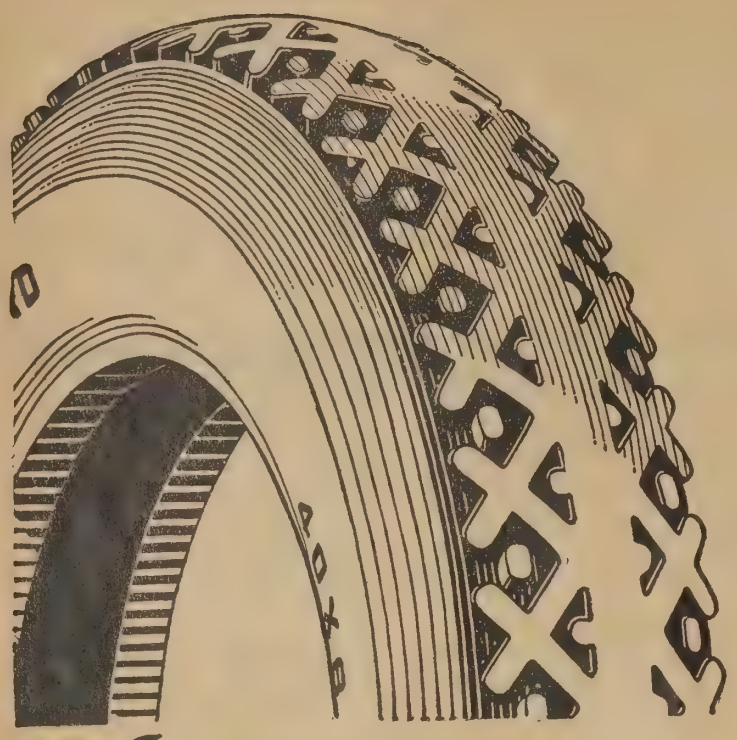
both pure-breds and grades from clean herds. If you want cows, bulls or calves for calf club work we can supply your order up to several car loads. Our prices are very reasonable.
CARL BRUGGER, Sec., Fond du Lac, Wis.

Wisconsin For Holsteins

Qualified, reliable field men at your service if you buy through the Wisconsin Bankers' Association. For quality stock, all breeds and ages, grade or pure-bred, wire or write.
BANKER-FARMER EXCHANGE, R. V. Gunn, Director
520 First National Bank Bldg. Madison, Wisconsin

You Can Raise a Crop of Granddaughters of the
Highest Yearly-record Butter Bull in World
— For His Nearest Three and Seven Dams —
PRINCE AAGGIE OF BERYLWOOD

His dam has just made a world's record by producing nearly 1,100 pounds of butter on two milkings per day, being bred to qualify in the 305-day Division



His nearest three dams averaged 1283 pounds butter; and their milk averaged 4.14% fat. His nearest seven dams averaged nearly 1200 pounds butter.
You can have one of his sons of service age; priced right; guaranteed to be breeders and free rom tuberculosis; bred in a county now being made a tuberculosis-free area and in a herd that as passed seven consecutive clean tests.
BERYLWOOD STOCK FARM, J. W. Snodgrass, Mgr., HUENEME, CALIFORNIA

COW COUNTY, U. S. A. CLEAN State or Fed. Tested Herds

Have 400 PURE-BRED HEIFER CALVES for calf club calves, to select from—$60 to $150. 100 BULLS, at farmers' prices. Write your wants. Several carloads choice pure-bred and grades, all ages. Now is the time to buy them and put them on pasture. Co-operative Association service.
Write or wire for information
WAUKESHA COUNTY HOLSTEIN BREEDERS' ASS'N
Office: 133 Barstow St. Waukesha, Wisconsin

A YEARLY RECORD HERD

The Clover Lawn Farm Holsteins. 150 head. 60 cows with yearly records. 20 young bulls, one month to 2 years old for sale, sired by King Longfield Pearl Vale, whose dam made 1225 lbs. of butter 26,050 lbs. milk a year. Can spare a few choice young cows. State exactly what you want.
JOHN H. PULS ALLENTON, WIS.

Introducing the

NEW Kelly Cord

For Commercial Use

—an extra rugged tire that will stand up under the rough all-around service tires are called upon to give on the farm

It doesn't need much examination of the new Kelly Cord to convince a car-owner that here is a real tire.

The new Kelly Cord has all the good qualities of the famous Kelly Kant-Slip, plus extra strong sidewalls and a much more massive tread, with reinforced shoulders that add to the life of the tire.

Developed originally to meet the need for a dependable pneumatic truck tire, the new Kelly Cord has been giving such phenomenal service that our dealers and the public alike demanded it in sizes suitable for passenger cars and the smaller trucks.

Now you can get it in all sizes from 30 x 3½ up to 40 x 8.

Whether your driving is done over "hard" roads or rutted dirt roads, the new Kelly Cord will give you unequalled service.

Try one on your car or truck.

Kelly-Springfield Tire Co.

250 West 57th St. :: New York

Your Fordson Needs a "40"

You will appreciate the reasons why, the first time you see the "40" at work, and appreciate them more every day you use it.

Pulls lighter because all weight rolls and hitch adjusts itself

No other plow for the Fordson has the great draft-reducing combination of rolling landside and self-adjusting hitch.

You know that it is much easier to roll weight than to drag it. All weight of the John Deere "40" is rolled; rear weight rolls on the rolling landside just as front weight rolls on the front wheels. There is no dragging friction—no handicap to the lightest possible plow draft.

The hitch adjusts itself to the correct line of draft at all depths—bottoms always run true and level, doing good work and pulling light all the time.

And besides exceptionally light draft, you get these advantages with the "40"—

—genuine John Deere bottoms famous everywhere for good seed-bed-making, scouring and long wear. There is a type for every soil.

—genuine John Deere quick detachable shares; unusually strong and close-fitting. Loosen one nut to remove share; tighten the same nut and share is on tight.

—beams of special hard and tough John Deere steel, guaranteed not to bend or break.

—hot-riveted frame connections—no give anywhere.

—simple, positive power lift; unusually high lift for clearance when turning.

SEE THE "40" on display in your town. Ask for a demonstration. Write us for your free copy of the "40" folder for Fordson owners. Address John Deere, Moline, Illinois, and ask for Folder FE-414.

JOHN DEERE

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

The WINDMILL with a RECORD

The Auto-oiled Aermotor has behind it 9 years of wonderful success. It is not an experiment.

The Auto-oiled Aermotor is the Genuine Self-Oiling Windmill, with every moving part fully and constantly oiled.

Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet.

The Auto-oiled Aermotor is so thoroughly oiled that it runs in the slightest breeze. It gives more service for the money invested than any other piece of machinery on the farm.

You do not have to experiment to get a windmill that will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine.

Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production.

The Aermotor is made by a responsible company which has specialized in steel windmills for 36 years.

THE MODERN PARABLE OF WEEDS

S. R. WINTERS, Washington, D. C.

THE Biblical parable of the tares and wheat is an old, old story of how noxious plants interrupted the growth of productive agricultural crops. Today farmers are still confronted with the problem of eradicating weeds that stifle the life of farm crops. The noxious plants are of increasing numbers, some of which are harmful to field crops while others are poisonous to live stock. The morning glory, Canada thistle, sow thistle dodder, quack grass, garlic, snake root, wild turnip, and wild radish are among the more common enemies of the noxious weed family which are to be combatted by farmers in 1924.

Nelson County, North Dakota where the sow thistle is said to endanger the agricultural industry, is an example of the organized effort necessary to combat noxious weeds in North Dakota. The plans of attack in 1923 included the inauguration of a publicity campaign in April. This exploitation contained a description of the plant, its nature and habits of growth, and an indication of its infestation in this country. Two circular letters in June and another in July were issued, scheduling meetings in nearly every township. Furthermore, the farmers were informed of the seriousness of this pest. The results of this organized effort were as follows: Three weed commissioners were appointed; sixteen meetings were held, representing a total attendance of 427 persons; eleven committees were appointed to assist in rounding up complaints of neglected patches of weeds; and 783 patches of weeds were located.

CLARE A. MEHARRY, TIPPECANOE COUNTY, INDIANA, CLUB BOY IN HIS FIELD OF SOY BEANS

Canada Thistle

The prevalence of Canada thistle in Rock County, Minnesota, is being combatted by the sowing of alfalfa as an eradication agent. Demonstrations conducted by M. E. Teeter, county agricultural agent, for the past two years have shown that a thick growth of this legume will stifle the Canada thistle. The soil is pulverized thoroughly and the alfalfa seed sown in early summer. The second season of the growth of this legume revealed the presence of only a few thistles. And during the third season of the growth of alfalfa there was a total absence of this pest.

The methods of destroying the Canada thistle in Lyon County, Iowa, involve one of three experiments; First, plow the land in late spring and seed to some smother crop such as sorghum, sudan grass, or millet. After this crop is removed in the fall, the land is cultivated so that the thistle will not thrive. The following season the soil is planted to corn or some crop requiring cultivation. Second, plow the land in early fall, after a crop such as oats has been harvested, deep enough to penetrate beneath the underground horizontal root system. The thistle plants are then raked and harrowed, the roots being destroyed. The soil is then cultivated until freezing weather so that the remaining thistles cannot grow. The succeeding year this land is planted to a crop requiring cultivation. Third, plow the land infested with thistle in early spring and cultivate it throughout the growing season in order to stifle the growth of this pest. A cultivated crop is planted the succeeding year.

Morning-glory

Experiments in Monterey County, California, involved the use of carbon bisulphide in eradicating morning-glory. A farm adviser used three plots of infested land for these tests. In the first plot, the holes for containing the carbon bisulphide penetrated to a depth of six inches; in the second plot, the holes were twelve inches deep; and in the third plot, the holes attained a depth of eighteen inches. The holes were spaced at distances of two, four, six, and eight feet. The amounts of carbon bisulphide used in each hole were one, two, three, four, and five ounces. The most satisfactory results were obtained in the holes eighteen inches deep and three feet apart, with four ounces of carbon bisulphide in each hole.

Garlic

With 12,000 acres of land in Pike County, Indiana, infested with garlic, a concerted movement is in progress to eradicate this pest. Dubois County, in the same state, is conducting a similar campaign as the result of a joint meeting of farmers, grain dealers, and cream buyers. A preliminary conference was held with the grain dealers in order to ascertain their attitude on the subject, whose expressions attested to the seriousness of garlic. Seventy persons attended this meeting, many of them signifying the intention of ridding their farms of this pest. The clean-culture method has been adopted in Dubois County, Indiana, as a means of eradicating garlic. Community meetings were held in this county and addresses were delivered by representatives of the grain and cream trades. A representative from Purdue University devoted considerable time last summer in that section to prevent the spread of garlic.

Poison Plants

A poison-weed survey in Clinton County, Indiana, indicated that live stock was sustaining losses by reasons of the presence of poisonous plants. Sheep and cattle had died from trembles on two farms, the effects of having eaten snakeroot. On another farm where a stock raiser had sustained losses of three sows in a mysterious manner, water hemlock was found in abundance. Since that time exhibits of both snakeroot and water hemlock have been displayed conspicuously in a window in Frankfort and an article explaining the nature of these poisonous weeds published in the local newspapers.

Dodder

Objectionable weeds in Idaho are being eradicated by spraying. For instance, dodder is being eliminated by a sodium arsenate spray. The latter is prepared by the United States Smeltering, Refining, and Mining Company of Salt Lake City, Utah, and it takes the name of "Ussco weed-killer". Dilutions of one part of "Ussco" to fifty parts of water and one to four hundred parts have been employed, respectively. Dodder is thus killed completely if the spray is applied in the early stages of growth. Two, three, and four applications of sodium arsenate will eradicate Canada thistle and morning-glory has been killed by this same treatment to a depth of twenty-four inches.

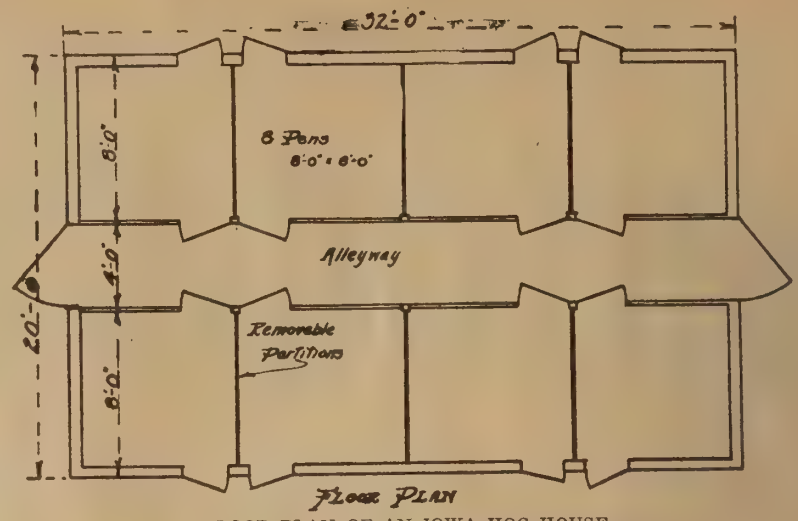
South Dakota is employing a novel method for controlling noxious weeds. A herbarium—a book containing the history of various weeds—is maintained. This book was fashioned from a discarded tailor-made cloth sample book. The names of the different weeds and bits of descriptions are thus permanently recorded. It is displayed at picnics and other gatherings of farmers, at which time the characteristics of the Canada and sow thistles are discussed. Moreover, the farmers in South Dakota are plowing to a considerable depth as a means of eradicating the Canada thistle.

AN IOWA HOG HOUSE

C. M. FRUDDEN, IOWA

A PRACTICAL hog house for a little money is to be found on the farm of Mrs. S. H. Trask of Iowa. The labor was done at odd times by farm help. This model piggery is 20x32 feet in size. It has a four foot feed alley through the center. The side walls are three feet and six inches high.

The outside walls are framed of two by four studding placed two feet



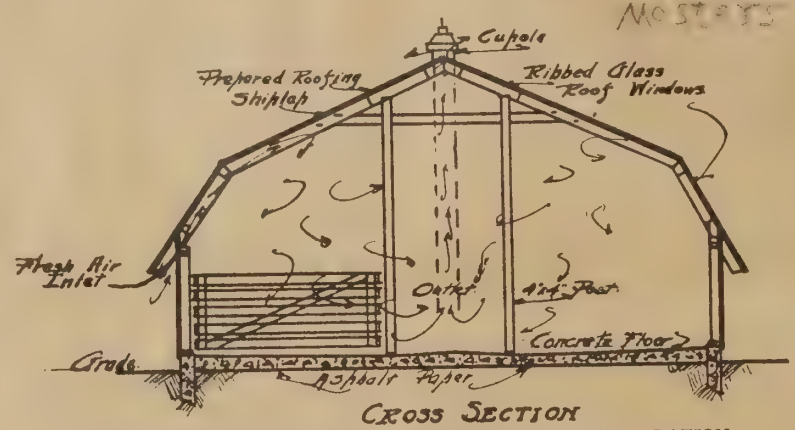
HOG HOUSE ON FARM OF MRS. S. H. TRASK

on centers and with six inch drop siding. This makes an economical, warm, and quickly erected building. Rafters are two by fours placed two feet apart, covered with eight inch shiplap and slate surfaced roofing. This type of roof adapts itself very well to hog house construction, as it allows for a low side wall and still gives sufficient head room over the entire floor because of the first rafter being nearly perpendicular. The building is placed running north and south. There are two rows of roof windows on both the east and west roofs; one row being at the ridge, and the other at the first hip. This arrangement catches the early morning and late afternoon sun, as well as the noon day rays. The building is only eleven feet high over-all. This means little waste room overhead and a house easy to keep warm.

This size house allows for eight pens, eight by eight feet in size. This makes an ideal sized room for the average pig litter. Partitions are made of six-inch rough boards cleated together and made removable in sections. The small door leads from each pen to the outside feed floors on either side of the house.

Two revolving cupolas and four inlet openings take care of providing fresh air for Mr. and Mrs. Hog and their little ones. The ventilators are placed on the ridge and are connected with canvas sacks which lead down to within two feet of the floor. The fresh air from the outside enters under the eaves and passes up the boxed-in rafters. This provides for an economical and successful ventilating system. The warm fresh air is retained in the building, and only foul, cold air on the floor is taken out. The system can easily be shut off during the coldest days by merely tieing a cord around the canvas outlet bag.

Eighty sacks of cement were used to make a good foundation and floor.



FLOOR PLAN OF AN IOWA HOG HOUSE

The outside foundation walls were run up eight inches above the grade line so as to keep the wooden frame work dry. The cement floor was laid as follows: Gravel was hauled in and placed over the entire floor about six inches thick. Then a layer of old asphalt roofing was laid over the gravel and the four-inch concrete floor poured on top. The idea of using the roofing paper was to prevent any dampness or frost from coming up from beneath. The floor was well sloped to the center alley and from there to either end door.

With this dry and warm floor, the successful ventilating system, and the many well placed ribbed glass roof windows diffusing the rays of the sun over the entire house, this investment has proven to be a good one. The upkeep expense will be small and its years of usefulness beyond number. This house is yielding healthy pigs in record time.

A complete list of materials used and their location in the building, follows:

80 sacks Portland cement—floor and foundation.
32—2"x4"—16' plates and sills.
13—2"x4"—14'side wall studs.
11—2"x4"—12' end wall studs.
17—2"x4"—14' rafters.
6—4"x4"—9' alleyway posts.
3—2"x4"—10' rafter ties.
932 ft. 8" shiplap for roof.
600 ft. 6" drop siding for side walls.
172 lin. ft. ¼ for trim.
112 ft. ¼ flooring for doors.
4—1"x6"—16' for door cleats.
9 rolls slate surfaced roofing for roof.
16 single roof windows.
2 suction ventilators.
6—1"x6"—16' rafters ties.
23—1"x6"—14' rough for partitions.
19—1"x6"—16' rough for partitions.
4—1"x6"—12' rough for partitions.

CONSTRUCTION DETAILS AND PROVISIONS FOR VENTILATION

Upper Michigan's Dairy Special

L. D. TUCKER, MICHIGAN

PREACHING the gospel of better sires, better feeding, better breeding, and weeding, the Cloverland Dairy Special, June 2 to 21, toured the Upper Peninsula of Michigan visiting 39 different communities, leaving in its wake not only more knowledge and light in the modern practices of dairying, but a trail of 37 pure-bred, pedigreed bulls, 20 Holsteins and 17 Guernseys, to "carry on". The total attendance at these meetings was estimated at 4,000 farmers.

The Special consisted of two live stock coaches, one flat car for display purposes, a day coach, a Pullman, and a diner. The train was the combined result of the co-operation of the five railroads operating throughout the Upper Peninsula of Michigan, the Michigan Agricultural College, the Upper Peninsula Development Bureau, banks, and various other agencies. It carried stock for both demonstration and sale purposes. Included among the sale stock were these pure-bred, pedigreed, registered dairy sires.

Accompanying the train were some dozen or more dairy specialists who participated in the program at each stop. The program included talks on breeding, feeding, the organization of bull and cow testing associations, financing the dairy herd, marketing the product, and, in fact, practically every phase of modern dairy management. And there was a live and kicking animal carried along to emphasize every argument.

For instance, there was old Gun Powder, the lowliest scrub cow that ever rattled her meager offerings into a rusty pail; last year she gave about 3,000 lbs. of milk. Standing next was her daughter from a pure-bred sire, who doubled the production of her low-caste parent in an annual test. Lo and behold, next was the granddaughter, likewise from a pure-bred, whose annual production record more than doubled that of her mother.

And there was His Majesty, the pure-bred sire, with a placard above him showing what he contributed to humanity through the production of his offspring. Right beside him, somewhat belittled by the comparison, was the nameless scrub sire.

At each stop following the demonstration, farmers had an opportunity to purchase pure-bred bulls carried on the train for distribution. As a result of the splendid co-operation of D. L. McMillan, newly appointed county agricultural agent in Chippewa County, seven pure-bred bulls were sold in that region. The prize "bid bull", consigned to the train from the pure-bred herd at the Newberry State Hospital, went to two Finnish farmers at Bruce's Crossing, who bid $211 for the animal. This thirty-two pound bull was offered along the route to the highest bidder. The bids were sealed and opened upon the completion of the itinerary.

Upper Michigan's Dairy Special was an unqualified success. This picture shows the Special "in action" enroute.

Here is a typical incident enroute. Three husky looking Belgians stepped up to one of the dairy specialists whom they chanced to meet on their way through the car and said, "Meester, you show us those pure-breds. We buy—maybe." They were lead back into the rear car and there given their choice of animals on display. They were also given the benefit of a price which, with the freight and other incidentals, would have been about double had they bought direct from the breeder.

So there at Beaver, in the Upper Peninsula of Michigan, those three Belgians bought their first pure-bred bull, organized their bull association before leaving the train, elected their president and secretary, paid their money, took the animal and his record sheets—and went off home to build three more dairy herds for Cloverland, the Upper Peninsula of Michigan.

Saved By a Hair

A glib oil stock salesman in the Southwest had just finished describing the glorious opportunities of his propositions to a prospect with the question: "What do you think of it?"

"I think," slowly drawled the previously bitten prospect, "that there is just one thing that saves you from being a bare-faced liar."

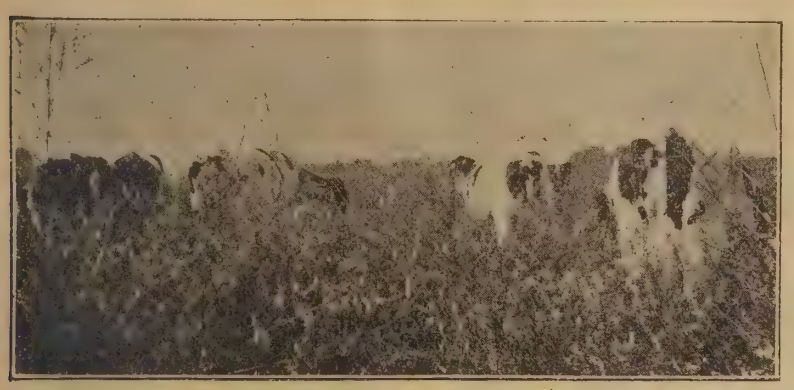
"What is that? asked the startled salesman.

"Your whiskers."

EVER FAILING OR NEVER FAILING PASTURE

Eighty Farmers' Experience With Sweet Clover

Part 4.



WILBER J. FRASER, University of Illinois

The combined experience of 81 dairymen is: That three-fourths of an acre of sweet clover pasture is an ample allowance to furnish sufficient feed for a cow for six months.

That the deep-rooting qualities of sweet clover enable it to resist drought and furnish abundant feed during July, August, and September when bluegrass pastures are frequently dried up.

WITH the ever recurring failure of bluegrass pasture in the chief dairy states, and with the expensive and laborious system of summer feeding that is necessary when it does fail, the dairyman naturally asks whether there is any other pasture crop that will supply plenty of suitable feed for his cows throughout the summer. The quest for such a pasture is highly important, because it is just as necessary in economic milk production to have good pasture for summer feeding as to have corn silage and legume hay for winter feeding. Because sweet clover gave promise of being such a reliable summer feed, I began raising it on my farm in Northern Illinois ten years ago. The results were so promising that I have spent considerable time during the last few years studying this crop wherever possible.

To continue this study, I sent a questionnaire to a large number of farmers in different parts of Illinois, whose names were furnished by farm advisors, as having had experience in pasturing sweet clover with dairy cows. The questions asked were about the carrying capacity, length of the pasture season, production of milk while on sweet clover pasture, whether the cows were troubled with bloat, the effect of this pasture on the flavor of the milk, and, finally, the farmers' opinion as to the value of sweet clover pasture as compared with bluegrass for dairy cows.

Sweet clover on L. D. Wilson's farm in Central Illinois, still produced an abundance of fine feed August 9, when bluegrass pastures were nearly dried up.

Carrying Capacity Three-Fourths Acre Per Cow

On the 81 farms from which reports were received from men who had experience in pasturing dairy cows on sweet clover, there were 972 acres of sweet clover pastured the first fall, after it had been sown in small grain in the spring. This area pastured 1,288 cows (or cow equivalents in other stock) *making an average of .75 of an acre per cow.* Nine hundred and sixteen acres of sweet clover were pastured the second year with 1,367 cows, *making an average of .67 of an acre per cow.*

The sweet clover was sown with small grain in the spring and pastured that fall and the following summer, *the one seeding of sweet clover furnishing pasture for an average of 190 days.*

The actual experience of these farmers is that sweet clover makes a record far better than "a cow per acre". It took only three-fourths of an acre of sweet clover to pasture a cow on these 81 farms. That is the average efficiency of sweet clover pasture. These were not a few exceptional cases but the common experience with sweet clover in all sections of the state and under all the varying conditions on these farms. It is the trustworthy average of 81 demonstrations in practical dairy farming that sweet clover pasture has four times the carrying capacity of bluegrass.

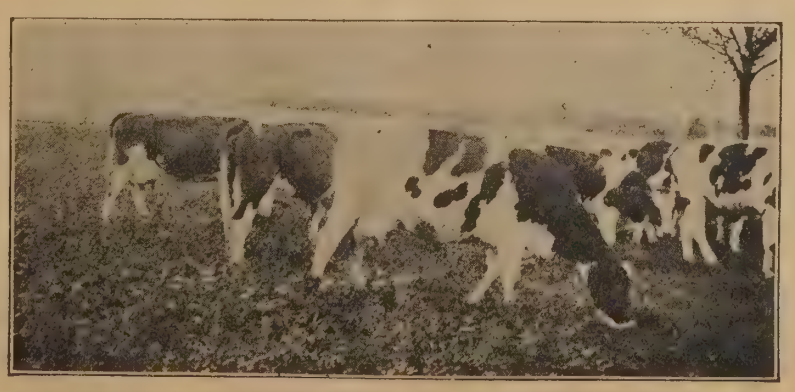
Six Full Months of Good Pasture

A most important fact to be learned from the experience on these 81 farms is the length of the pasture season—six months. It differs 19 days between Northern and Southern Illinois. On the average, dairymen in Southern Illinois can turn their cows out on sweet clover pasture by April 15, and it will furnish pasture until about November 1—six and a half months. In the northern part of the state, they can usually turn out by April 25 and can keep the cows on the sweet clover pasture until approximately October 25—six months. *Six full months of good pasture,* capable of supporting well over a cow to the acre, is a tremendous item in the cost of the year's feed and the resulting economy in milk production.

The Old and New Clover

The management of sweet clover pasture requires the seeding of biennial white sweet clover each year in the small grain. The cattle begin in the spring on the second year's crop which comes on early. They graze on this until the middle or last of August, when they are turned on the new clover in the stubble, and use it until the latter part of October. The old clover and the new seeding are growing on the farm each year, and the six months' pasture is partly from the one and partly from the other. The pasture requires but one year's use of the land, however, because a crop of small grain is cut from the same land on which the clover grows the first year. The expense of the ground is chargeable to the clover for only one year—the second year of the clover's growth.

The average length of time cows are on the first year's growth in the fall is 80 days in Southern Illinois, and 60 days in Northern Illinois.



Thirty-two replies to a questionnaire upon sweet clover pasture sent out a year ago, and reported in Hoard's Dairyman April 27, 1923, showed a carrying capacity fully equal to that reported this year—.67 of an acre per cow—and a pasture season of 5.6 months.

Most Drought-resistant Pasture

The established fact from this farm experience and the four years' bluegrass test at the University of Illinois is that sweet clover has a six months' pasture season and a carrying capacity of three-fourths of an acre per cow, while bluegrass furnishes pasture for only about two months and requires over two acres per cow. The principal reason for this advantage is that sweet clover does not fail in time of dry weather.

The total advantage of sweet clover, however, is far greater than that resulting from four months' increase in pasture season, and its far greater carrying capacity, when we consider the extra labor and expense of providing supplementary feed when bluegrass pasture fails. The cow's requirement is continuous throughout the summer, and the greatest need is for an abundant pasture in the trying time of flies and excessive heat, which is just the time when bluegrass fails so miserably to supply sufficient feed. In order to solve the pasture problem economically, we must have an ample and continuous supply of feed for the six months of summer, and sweet clover provides this.

All these answers from the 81 farmers made it clear and positive that *the sweet clover stayed green and fresh throughout the hot and dry weather of July and August when bluegrass pastures were burned up.* This means that with sweet clover the six months' pasture season is *really a season of pasture from beginning to end,* with fresh, green feed in abundance at all times for the cows.

Ed. Rehling's cows in Southern Illinois on sweet clover that was six inches high May 10. They had been on this pasture nearly three weeks—two weeks earlier than the cows should be turned onto bluegrass.

The result in maintained milk flow, in condition of the cows, and in decreased labor, only men who are feeding and milking cows can fully realize and appreciate. Sweet clover is thoroughly dependable. It goes down deep for its food and moisture, and is a hardy continuous grower, holding its rich green color until it dies naturally in the latter part of August—the time when the young, green plants can be turned onto. These are the very great advantages of this deep-rooted legume.

Milk Production on Sweet Clover

The production of the cows while on sweet clover pasture, as reported by the 81 dairymen, varied so greatly, depending upon the individuality of the cow, the stage of lactation, and the amount of supplementary feed given, that it is impossible to draw definite conclusions upon this question; and yet it is evident that they did not lack for plenty of good, nutritious pasture which stimulated them to high milk production.

Most of the farmers reported that they were highly pleased with the production of their cows when on sweet clover pasture and several reported better production on sweet clover pasture without grain than on such an excellent winter ration as corn silage, legume hay, and a good grain ration.

One cow on my own farm produced 56 pounds of milk per day on sweet clover pasture without grain, and I have seen several other cows that produced this amount or more per day on sweet clover pasture without grain. One of these cows, belonging to Mr. Renschen, of Clinton County, produced 75 pounds of milk on three milkings per day without grain. On sweet clover pasture alone without grain, Mr. J. O. Tupper, of McHenry County, had a cow produce an average of 54 pounds of milk per day for four months, and a two-year-old heifer an average of 48 pounds for one month. Here is high evidence of the long time feeding value of sweet clover for dairy cows.

The answers on other points of the questionnaire, dealing principally with the common objections to sweet clover, must be reserved for the next chapter.

The Inventor's Manual

The faculty of inventing is possessed by almost everyone. You may have invented some little device which you are using in your home or in your every day work that is patentable and for which there is a good market. The Inventor's Manual, published by the Norman W. Henly Company of New York City, tells in a simple, interesting fashion the whole process of invention, patenting, and making the patent pay. The book was written by George M. Hopkins, a successful inventor of twenty-five years' experience, and the third revised and enlarged edition, now ready for distribution, contains notes based on the experience of many other inventors. Some of the subjects treated in this volume are How to Invent, How to Secure a Good Patent, Value of a Good Invention, How to Estimate the Value of a Patent, How to Interest Capital, Advice on Selling Patents. The book also contains the 1920 census by occupation, and by population in counties over 10,000. The Book Department of Hoard's Dairyman can supply the manual upon receipt of the regular price, $1.50.

Flowers make a house a home.

South Florida Dairies

ELEANOR BISBEE, FLORIDA

THIRTY new dairies started in one county during one winter indicates the rate of growth of the dairy industry at the southern end of the state of Florida where, at one time, it was claimed that cattle could not live. As soon as there were enough people to constitute a market, pioneers found a way to keep cattle alive.

Now this is the land where the amateur dairyman vies with the man of 30 years' experience on almost equal terms, for conditions here are so different that the man who knows too much may do even worse than the man who knows nothing at all. There is more than local interest in this, for already the world has had to bow to a Dutch Belted cow of Dade County, Fla., that holds the world's record in that breed for milk production; already it has found a rapidly growing market for good dairy stock at the southern end of Florida, which sends buyers to herds all over the United States every year; already there is a herd in South Florida that challenges any other herd in the United States to equal its average production record; and then there are dairymen all over the United States yearning to know of a place where they can escape the rigors of winter and yet stay in the dairy game.

Here are some northern impressions of Florida dairying: "No good cattle can survive tick fever there." "It is not safe to take children south, because they cannot get good milk." "Southerners are too lazy to keep good stock." "There is nothing for cattle to eat in the Everglades except sawgrass and alligators."

Here are some facts, on the other hand, that can be verified in Dade County, Fla., the only truly subtropical section of the United States.

Dade and the adjoining counties were made tick free about eight years ago and whatever quarantines apply elsewhere against Florida cattle do not apply to south Florida stock.

The blue ribbon Jersey bull of the Dade County Fair in 1924 was Ixia's Fontaine Oxford, grand champion of the Vermont State Fair, 1920, and second at the Eastern States Exposition, whose former owner, J. G. Howland, of Quechee Falls Farm, Vermont, spent the winter near Miami, and became so favorably impressed with dairying conditions that he felt it desirable to place some of his finest animals here.

It is, however, a "cracker" dairyman who now has an enormously costly plant in the famous White Belt Dairy, which challenges any U. S. dairy to beat the average 365-day A. R. O. herd record of 9,998 lbs. milk and 412 lbs. fat, the tested herd including junior two-year-olds and seniors; and who is said to have the largest privately owned herd in America on the accredited T. B. list. That man is Dr. J. G. DuPuis, president of the National Dutch Belted Cattle Association, whose cow, "Gem of Columbia", holds the world's production record for that breed.

Sawgrass and alligators have surrendered to drainage in enough of the Everglades to prove their value for cattle. Largely due to the pioneer work of James H. Bright, former stockmen of St. Louis, satisfactory grasses have been found. Para and napier are the two most popular at the present time, although lespedeza which is being so popularized in Mississippi as the alfalfa of the South, is easily grown as are also paspalum, guadura, Seminole, and Nassau corn.

So much for the trend of dairying interests in South Florida. It has its problems also. South Florida dairymen, as pointed out, are entering the northern markets to buy good stock. A few years ago it was said that light skinned cattle could not stand the southern sun and that stock imported in the summer would not live. The first milk week campaign, held about four years ago, so increased the demand for Dade County milk that venturesome dairymen brought in the first carload of cows in August and they all lived and did well. Now August and September, the latter the hottest month here, are times of heavy importations, nearly 20 carloads having been brought in last year.

FIELD OF NAPIER GRASS IN DADE CO., FLORIDA

A FLORIDA WORLD'S CHAMPION

Gem of Columbia, owned by Dr. J. G. DuPuis of Florida, holds the world's record for production in the Dutch Belted breed.

Production per cow is the vital thing here. Milk sells at 20 to 25 cents a quart the year round. It is too expensive to feed to calves, and, except for the satisfaction of knowing what one has, it is conceded to be as cheap to import stock as to raise it and yet half of many of the best herds were born and raised in Dade County. Concentrate feed is variously estimated at $10 a ton more or sometimes double the cost of the same feeds in the North. At $125 a head and with high feeding costs, dairymen cannot afford to keep boarders. One producer, the son of one of the pioneer dairymen, says he is getting as much milk now from 50 head as from 80 formerly, merely by increasing the feed and getting rid of the boarders.

CUTTING PARA GRASS IN JANUARY ON A FLORIDA FARM

Milk week campaigns are doing wonders in Miami. The first one stimulated a demand that nearly doubled the number of dairies. The succeeding ones have not only had a great temporary effect but lasting results. Miami, the main retail market, has a permanent population, including its suburbs, of nearly 75,000, but it has a winter population of about 150,000. A summer surplus is a constant dread of many dairymen and milk week seems the practical way to convince the many northerners in Miami that the old bugaboo of inferior milk in Florida is dead and that they should drink more milk.

Dade County was the first place south of Atlanta to have a certified dairy and that had its effect on the tourists as well as on the home people. It established confidence in one dairy and then visits to other dairies and study of the board of health monthly reports on each dairy revealed that many in the county have similar standards of cleanliness and quality. In a milk week in Miami, systematic education on the food value of milk and the importance of patronizing a home industry is supplemented by motorcades to visit the county's dairies that now represent an investment of more than $3,000,000.

The Dade County dairies are knocking at the doors of the national dairy interests for recognition as a factor in maintaining dairy standards in America. They aim high both for stock and products, they achieve gratifying results and they enlist the active interest of consumers. Woe be to the northern dairies that put on the market a product inferior to South Florida's after their people have wintered in Miami and learned to drink milk!

Winter or Summer Freshening

HOARD'S DAIRYMAN:—The question as to whether cows freshening during the winter or summer months have the largest butterfat production and total value of product has urged the writer to present the following figures for evidence in favor of winter freshening:

	Cows	Fat lbs.	Fat value
March	19	219.2	$.55
April	14	252.7	.46
May	21	227.4	.44
June	18	236.8	.39
July	16	223.0	.36
August	20	258.5	.38
September	29	290.6	.46
October	25	279.5	.53
November	18	261.0	.57
December	21	239.0	58.6
January	25	275.4	.54
February	17	262.5	.56

The first column of figures represents the number of cows freshening during each month; the second column the average pounds of butterfat produced by those cows, and the third column gives the average price paid for butterfat during that particular month.

It will be seen that the average production of cows freshening during the spring and summer months beginning March and ending August was 236.3 lbs. fat, the month of March being the lowest with 219.2 lbs. fat. The cows that freshened in the fall and winter months beginning September and ending February had an average production of 268 lbs. fat, and September was the high month with 290.6 lbs. fat.

It can also be noticed that the price paid for butterfat by three creameries during the spring and summer months was 43 cents while 54 cents was paid during the fall and winter months.

From the fact that those cows freshening during the fall and winter months had the highest yearly records and that the price received for butterfat was highest during those months, it is evident that the total value of the product of those cows will be higher, since the largest production would undoubtedly come during the early part of the lactation period when the butterfat prices are highest.

Iowa. OLIVER CONSTABLE.

Uncle Ab says he's never known anybody who didn't improve on acquaintance; those he first thought good, proved even better; and those he thought wholly bad showed some good traits.

Cow Testing Associations

Association Notes by Testers

Middle Bucks, Pa.: Farmers are sowing soy beans and expect to cut them for hay. Farming is not progressing very fast on account of the wet weather. The next meeting of the association will be held at P. B. Whitehead's in August. The high cow for the year, ending in March, is owned by C. J. Koller, Canary, a pure-bred Holstein, making 16,227 lbs. milk, 540.6 lbs. fat. The high herd in fat production, owned by W. S. Bishop, produced an average for 9.42 cows of 8,890 lbs. milk, 388.4 lbs. fat. H. H. Baum's herd of 7 cows had the highest milk production, their average record being 11,117 lbs. milk, 372 lbs. fat. Twenty-one cows produced over 400 lbs. fat. The average return for 306 cows tested was 7,724 lbs. milk, 384.3 lbs. fat. W. T. Wilkinson was tester in this association.—D. S. Taylor.

Mesa Co., Colo: The first month's work of this association shows a high herd average of 40.99 lbs. fat per cow. High priced feeds have been largely replaced by more economical ones. Three separators showed a loss of $1.50 to $3.00 per month. Market milk sold for $2.90 per cwt. and retailed for 12½ cents per quart. The creamery paid 37 cents per lb. for fat.—C. H. Boyd.

Sanders Co. No. 1, Mont.: Two new separators were purchased. Irrigated pastures are in good condition. One member expects to install a milking machine. Alfalfa is nearly all cut and stacked and in very good shape on account of the dry weather.—H. Engsberg.

Flathead, Mont.: Last month one herd produced fat for 3.9 cents per lb. and milk for 16 cents per hundred, while the highest cost for producing butterfat was 21 cents per pound and 94 cents per pound for milk. The re-organization meeting was held on June 14. R. E. Webster, State Dairy Commissioner, gave a speech. Market milk sold for $2.25 per cwt. and retailed for 10 cents per quart.—E. R. Ford.

Chester, S. Dak.: Another member is operating a milking machine, this being the third machine in use. Most members have alfalfa or sweet clover hay to harvest this year. Market milk sold for $2.00 per cwt. and retailed for 10 cents per quart. The creamery paid 35 cents per pound for fat.—A. J. Amberg.

Day Co., S. Dak.: One new milk house was built. All small grain in this section looks good excepting a few fields which were hailed out. Market milk sold for $2.00 per cwt. and retailed for 8 cents per quart. The creamery paid 38 cents per lb. for fat.—E. M. Duryee.

Washington Co., Kans.: Three herds were tested for tuberculosis; two passed clean and one had one reactor. Twenty-seven separators were tested. One that was doing poor work was replaced by a new one. The co-operative creamery paid 37 cents per lb. for fat; the cream stations, 31 cents. Milk retailed for 10 cents per quart.—H. G. Lenhert.

Wellsville, Utah: The 496 cows tested last month produced an average of 860 lbs. milk, 29.6 lbs. fat. Ninety-two cows produced more than 40 lbs. fat. A 7-block bull association has been organized. Alfalfa hay is selling for $10 per ton on the land. The hay crop is reduced in many localities because of the drought.—R. Hansen.

Alpena—Leer, Mich.: The increase of milk production in June over May was 32,000 lbs.; fat, 1,352 lbs. The association average was 711 lbs. milk, 30.1 lbs. fat.—C. Jennings.

Delta Co., Mich.: Twelve separators were tested. One lost 30 cents daily and another 23 cents daily. Four bulls were taken off the Cloverland special dairy train which traversed the Upper Peninsula the first of the month. Two new separators were installed. The creamery paid 37—38 cents per lb. for fat.—C. R. Olson.

Steuben—La Grange Co., Ind.: Two herds were tuberculin tested last month and 2 reactors found. Two cream separators were installed. Fourteen members are spraying cows daily.—G. M. Bell.

Sparta—West Kent, Mich.: Eleven members are feeding grain on pasture. Members are getting ready to cut their alfalfa. Most of them intend to make two cuttings instead of three. The condensery paid $1.75 per cwt. direct ratio for 4 per cent milk. The creamery paid 39-40 cents per lb. for fat.—L. Woodhams.

West Dakota Co., Minn.: In June one member sold 16 unprofitable cows out of a herd of 24. Most everyone is putting up hay which is a very good crop. Twenty-five members now have pure-bred sires. Ninety-two cows made over 40 lbs. fat or over. The association's average for June was 804 lbs. milk, 30.9 lbs. fat for 460 cows. Market milk sold for $1.80 per cwt.—L. L. Hammond.

Martin Co. No. 2, Minn.: One new silo was built. Members of this association are well pleased with the first cutting of alfalfa. Corn is looking good. The following shows the difference in production when milking 2 and 3 times per day. Last year a grade Holstein produced in 10 months 13,186 lbs. milk, 423 lbs. fat; feed cost, $78.75; gain over feed cost, $136.90, milking 2 times per day. This year this cow produced on 3 times a day milking, with the same kind of feed and care, in 5 months, 10,016 lbs. milk, 309.6 lbs. fat; feed cost, $52.22; gain over feed cost, $105.43. This cow was fresh about the same time both years, during the winter months.—H. A. Anderson.

Hamlin, S. Dak.: At this county's farm bureau picnic June 11 a milk testing demonstration was held. Also another demonstration was held at the boys' and girls' club camp on June 20 for the purpose of bringing out the benefit derived from cow testing. The creamery paid 36 cents per lb. for fat. Milk retailed for 8—10 cents per quart; butter, 45 cents per lb.—F. E. Hanson.

McLean Co., Ill.: This association re-organized with 29 herds for the coming year's work. For the month of June the average cow produced 692 lbs. milk, 30.8 lbs. fat, and made a return of $10.75 above the cost of her feed. Ninety-nine cows exceeded 40 lbs. fat. Milk retails in this section for 14 cents per quart; butter, 50 cents per lb.—H. R. Fletcher.

Colesburg—Two Co., Ia.: Two more cars of bran have been ordered for fall delivery. One car of mixed feed has been ordered for July to help out with the failing June grass pastures. The creamery paid 42 cents per lb. for fat.—G. H. Crawford.

Clark—Scott, Ind.: All but 4 of the 362 cows tested last month are grade or pure-bred Jerseys. Eleven members keep daily milk records. One member fed a good ration and raised his average 5 lbs. Sour cream brought 40 cents per lb. for fat; sweet cream, 45 cents. Milk retailed for 14 cents per quart.—W. W. Barnett.

Sheldon, Wis.: This association organized with 253 cows on test. There are 13 pure-bred bulls in the association. Six scrub bulls are used. There are 14 silos, 4 barns with drinking cups, and 9 modern barns. Six members feed grain on pasture.—G. E. Ronne.

Central Monroe Co., Wis.: Several separators were repaired. Many new silos are being built. One member replaced a double unit machine for a single unit so as to keep milk sheets. Several members averaged better than $14 per cow at the creamery. County tuberculin testing is now on and not many reactors are found. The leading cow, owned by John Muehlenkamp, has 545.6 lbs. fat to her credit and 2 months to go. The condensery paid $2.00 per cwt. for milk.—V. Sorenson.

Alma—Cochrane, Wis.: Two associations are now under way. Work is being done on the second annual report. Nineteen members purchased 115 gallons of fly spray this summer. More members are supplementing pasture with grain than ever before.—E. R. Bailey.

Mondovi, G. Modena, Wis: Five members are liming small fields and preparing for alfalfa either this fall or next spring. The splendid alfalfa crop in this section and the clover failure are convincing dairy farmers that alfalfa is the dairyman's hay crop.—W. E. Acker.

Crystal Lake, Ia.: The high cow for the past year has a record of 15,469 lbs. milk, 521.2 lbs. fat. The high herd for the year has a record of 9,879 lbs. milk, 334.7 lbs. fat. An abundance of alfalfa and sweet clover has been sown this year with prospects of a good crop.—H. W. Tiggeman.

Columbia Co., Wis.: Most every member feeds grain with pasture. One modern dairy barn and one silo are being built. Every member had his soil tested for lime. Alfalfa seeded by most every member this spring promises a good stand. The condensery and cheese factory paid 39 cents per pound for fat in June and the creamery, 39—40 cents. Milk retailed for 8 cents per quart; butter, 40 cents per lb.; cheese, 20—25 cents. The second year's work of this association shows that the 502 cows tested have an average production of 8,661 lbs. milk, 305 lbs. fat. Seventy cows made over 365 lbs. fat. Vosen Bros. had the high herd. One Holstein four-year-old has a record of 11,800 lbs. milk, 535.5 lbs. fat. Thirteen herds averaged over 300 lbs. fat during the year. Twenty-seven members have 42 silos; 17 have drinking cups; 19, swinging stanchions. The association is 100 per cent in pure-bred sires.—A. H. Weber.

Kane No. 3, Ill.: At the annual meeting of this association, Harry Averill was elected president and G. Dickeson was re-elected secretary and treasurer. The 627 cows tested during the year have an average production of 8,762 lbs. milk, 283.8 lbs. fat. Four herds averaged more than 350 lbs. fat. The herd of grade Holsteins owned by Melrne Bros. produced an average of 11,020 lbs. milk, 382 lbs. fat. During the month of June 586 cows made an average production of 863 lbs. milk 29 lbs. fat.—W. P. Schmit.

An Ohio Report

The Sharpsville—Orangeville, O., Cow Testing Association was organized April 1, 1922, with 25 members, comprising 347 grade and pure-bred cows. The average yearly production of these cows was 6,768 lbs. milk and 266 lbs. fat. During the present year the dairymen in this section formed an organization for better dairying and through the strength of this organization the association for 1923 increased the production of 400 cows to 7,483 lbs. milk, 297 lbs. fat.

Thirty-two cows of this number completed the year with more than 400 lbs. of fat. The highest averaging herd for butterfat was owned by Fred Diefenderfer with an average of 10,741 lbs. milk, 416.1 lbs. fat.

The highest averaging herd in milk production was owned by I. H. Miller and Sons, with 11,265 lbs. milk, 380.3 lbs. fat for 18 cows. Alberta's Victor Bonnie, pure-bred Jersey, owned by J. W. Morrison, completed a wonderful record of 9,046 lbs. milk and 539.1 lbs. of fat in 12 months. Bonnie was milked but twice a day and the greater portion of her roughage consisted of corn silage and timothy hay. What might be of interest to the young dairymen is that Bonnie was fed and cared for by a boy 16 years of age.

The highest individual milk record goes to a pure-bred Holstein, Della Alma DeKol, owned by R. B. Hobart. Her production of 14,423 lbs. milk, 435.6 lbs. fat was made under ordinary farm care on two milkings a day.

The increased production of 400 cows in association work for 1923 has made a total increase in dollar and cents to the members of $6,280. Can any one doubt the true value of cow testing work?

H. S. SERVICE, tester.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00 including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Says Sam: This is one year when there are more rainy days than there are rainy day jobs.

Ladino Clover

Ladino clover is a large or "giant" form of the familiar little white or Dutch clover common in lawns and pastures. It is probably a native of northern Italy where, on the rich, moist soils in the Valley of the Po River, it has long been a favorite forage crop. Under favorable conditions Ladino Clover forms a dense mass of succulent herbage ten to twenty inches deep composed of large leaves borne on long stalks arising from creeping prostrate stems. With the exception of the seeds all parts of the plant are identical with those of common white clover except that they are much larger. The seeds can not be distinguished from those of white clover.

Ladino Clover is especially adapted as a pasture crop for rich, well-watered soils in regions of moderate temperature. It does not ordinarily succeed on poor soils and it is particularly sensitive to lack of abundant and continuous moisture quite near the surface of the ground, consequently it should not be sown in localities where severe surface droughts are to be expected. It withstands extreme cold except on heavy clay soils not protected by a snow cover, in which case the plants are likely to heave badly in late winter. It was formerly believed that Ladino Clover did not suffer from hot weather provided it was well supplied with water. Recent experience indicates, however, that the plants turn red under prolonged exposure to hot sunlight and the stand is weakened.

In the regions where it succeeds Ladino clover is one of the most productive and nutritious pasture plants known and is unquestionably one of the most palatable to live stock. Repeated instances have been reported where a field of Ladino Clover has carried the equivalent of from two to four head of mature stock per acre continuously from spring until fall. During this period the production of milk, meat, or other animal products per acre has been greater than that from any other permanent grazing plant. The fondness of all kinds of live stock for Ladino Clover has been illustrated many times by the animals leaving good fields of alfalfa, red clover, or the grasses to feed on the Ladino. The palatability of Ladino, in fact, is sometimes disastrous since rabbits, gophers, grasshoppers, and other pests sometimes feed on it so voraciously as to destroy it. Even live stock, and especially horses and sheep, sometimes destroy the stand by too close nibbling of the prostrate stems. There is a belief that Ladino Clover does not cause bloating of cattle as badly as other leguminous pastures, but this is uncertain. So far as known Ladino clover is not subject to serious injury by diseases and insects, except grasshoppers and other leaf-eaters.

While the peculiar characteristics of Ladino clover are not yet thoroughly understood there are evidently certain sections in which it is excellently adapted, while for other localities it can not as yet be advised. The most conspicuous success with Ladino has been had in the irrigated sections of southern Idaho and in the coastal regions of Oregon and Washington. The plant is also promising for irrigated districts in Colorado, Utah, northern California, and eastern Oregon and Washington. It does not thrive in irrigated regions in the Southwest. Without irrigation Ladino has been a success in northern Michigan, on overflow land along the lower Missouri River, on the lower Mississippi and its tributaries, and in scattered places throughout the central United States where the soil and moisture conditions were especially favorable. It has also been very promising as a pasture plant on some types of hill soil in the Appalachian Mountain region, provided, in most cases, it received a phosphate fertilizer.—U. S. Department of Agriculture.

A 1000-lb. Fat Producer

CHESNEY FREDA LOTHIAN

A PROFIT of $839 over cost of feed and bedding was realized from the milk produced in one year by Chesney Freda Lothian, the latest pure-bred Holstein cow to produce over 1,000 pounds butterfat in one year. In the herd of the Essex County Hospital, New Jersey, she produced as a six-year-old 26,478.2 pounds milk containing 1,036.96 pounds butterfat—equal to 1,296.2 pounds butter, according to the Advanced Registry Department of The Holstein-Friesian Association of America.

During the year this cow consumed 6,550 pounds grain, 7,000 pounds hay, 2,000 pounds beet pulp, and 3,500 pounds silage, the cost of which was $306. No pasture was available. An additional $75 was required for 150 bales shavings used for bedding. Her milk alone brought $1,220, which represents a wide margin of return on her original cost price of $400 when purchased a year ago.

Chesney Freda Lothian was born on the farm of T. D. Morely, Ohio. As a junior three-year-old she produced in a year 18,138.4 pounds milk and 834.5 pounds butter. She is the 82nd cow in the Advanced Registry of the National Holstein Association to produce in excess of 1,000 pounds butterfat in 365 consecutive days.—Extension Dept. Holstein-Friesian Ass'n of America.

Quality Dairy Products Needed

The dairy cow produces a food which is proclaimed from the national temples of science as essential to the growth and health of mankind. The men who own dairy cows and the men who put their products into marketable form are among the few favored sons for they have a powerful appeal to sell their goods.

Let us start with the man with the cow. If he has cows of good quality, properly cares for them, gives them good feed, good water and considerate treatment, it stands to reason he will get more milk of better quality than a scrubman with a scrub cow getting scrub treatment.

The manufacturer of dairy products, by giving the public a constant supply of honestly and intelligently made and attractively offered goods for market, can make his own market. Nothing can equal a piece of bad butter or a piece of unpalatable cheese to destroy the market and there is no reason for either finding their way to the table of the consumer except through ignorance, stupidity, or selfishness—all equally criminal in their effect upon the industry and unprofitable to the man who offers them. Nothing that man can say will sell butter equal to good butter and nothing makes people eat cheese comparable to a steady supply of real, first-class, good cheese that pleases the average human palate. There is more appeal or more butter, more cheese, and more ice cream from a mouthful of good tasting products than from all that can be told in words or print.

So the answer to more money and more profit will come from just plain common sense practices and common honesty. When the bad stuff is sold, the mischief it causes does not end there. The low quality goods costs producers of honestly made, high class products untold losses through slackening consumption and causing all to be measured by the yard stick of just butter and cheese.

The American people are not entitled to be classed as fifth, sixth, or seventh nation in consumption of milk, butter, and cheese. Why prate of possibilities of over-production when our markets are hungry for good dairy products? The market is ours for the making. We owe it to our country for better agriculture, to humanity for a safe, essential food, to make good for science and to ourselves and posterity for a better and more satisfactory business. Let us get the big thought out of this—nature calls for our products. Let us cater to the best in human appetite, do our duty and prosper through service to our fellowman.

W. E. SKINNER.

Those Who Work

I extend pity to no man because he has to work. If he is worth his salt, he will work. I envy the man who has work worth doing and does it well. There never has been devised, and there never will be devised, any law which will enable a man to succeed save by the exercise of those qualities which have always been the prerequisites of success, the qualities of hard work, of keen intelligence, of unflinching will.—THEODORE ROOSEVELT.

Teacher (in geography class)—"Can anyone tell me where Pittsburgh is?"

Small Voice (in rear)—"Please, ma'am, they're playing in Chicago. —Pitt Panther.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, July 15—The decision of the U. S. Tariff Commission announced Tuesday afternoon, to investigate the tariff rate on butter, is received with very diverse feelings by various interests here. This is the fourth major agricultural duty which has been under investigation since the "flexible proviso" has been functioning, while no major industrial item or schedule has been investigated. A few minor industrial items have had attention, however.

The four agricultural items under investigation are or have been sugar, wheat, vegetable oils, and now butter. All four affect commodities, the domestic production of which run into tremendously large sums of money, nine figures in each account. The industrial commodities which have come before the Commission do not total a hundredth part of this sum.

The investigation, now under way, is at the behest of the Minnesota and northwestern dairy interests, and it is expected that they will take the leading part in the production of evidence to show that it costs more than eight cents a pound more to make butter in the United States than in foreign countries. If this is shown, the Tariff Commisson will recommend to the President an increase in the duty on butter.

⚜

The riddle, "when is oleomargarine not oleomargarine", has just been answered, much to the disappointment of the vigorous enforcers of the oleomargarine law in the Bureau of Internal Revenue and somewhat to the disquietude of the dairy industry, by a Federal Judge in Providence, Rhode Island. His answer in substance is when the oleaginous compound is packed in triangular boxes, and when "it can't fool my wife", as the judge remarked during the case. In other words, the Federal Court has declared that a product made of peanut oil and cocoanut oil, of the texture and appearance of butter, colored just like June butter, but put up in a triangular box and labeled by a trade name and called a cooking compound, is not oleomargarine and its manufacturer does not need to take out a license, subject himself to the inspection of the Revenue Bureau, or pay a tax for the sale of this product.

The case is disturbing the law enforcement officers, for they fear that it opens a door whereby the manufacturers may legally produce a product which can so easily be "bootlegged" as oleomargarine as to lead to wholesale frauds; also that this case constitutes a new definition by the court of oleomargarine very much different from the congressional and statutory definition.

⚜

C. E. Gray of the Golden State Milk Products Company spent a few days in Washington last week, coming here from Ames, Iowa, where he attended Commencement at Iowa State and received an honorary degree in recognition of his services and scientific attainments in the dairy industry. While here Mr. Gray interviewed a number of government officials as to the outcome of the recent supreme court case invalidating the 16 per cent moisture ruling. He is of the opinion that some clear-cut steps should be taken to clarify this situation to compel the acceptance of the same butter standard in both interstate and intra-state business. The Internal Revenue Bureau has not yet received the long expected Treasury Ruling on this subject which is being prepared by the Treasury Solicitor's office. However, in specific cases the Bureau has instructed agents to press pending cases where there is evidence both of a water content over 16 per cent and the use of a process or material for the purpose of incorporating this amount of moisture in butter.

⚜

The post-mortem examination of Sophie 19th, the record butter producing cow of the Jersey breed, has been performed and the scientists of the Dairy Bureau, under the direction of Professor Meigs at the Beltsville station, are studying the results. This, as told in a recent issue of Hoard's Dairyman, is part of a project in which the relation of "form to function" is to be studied widely and in great detail, as a part of the big general project of the Bureau to discover methods of fixing high producing strains among dairy cattle as high producing strains of grain and fruit can now be fixed through the discoveries of the plant industry scientists. It is known that the results found in the measurements of the internal organs of Sophie 19th were somewhat surprising. A complete statement will probably not be made for some time. The Bureau officials have plans made to secure the bodies of a number of other high producing animals of various breeds for continuation of the same study.

A Place for Everything

HOARD'S DAIRYMAN:—"A place for everything and everything in its place" applies to some farms and "nothing to be found when you want it" would suit others better. I have worked on farms of both sorts but the latter is not worth mentioning.

A Clinton County, Iowa, farmer used the first system and everyone who worked there or came there was impressed with the fact. Everything had a place and was in that place and in good working order when needed. This applied to his machinery as well as his tools and minor equipment. For instance, as soon as the corn was laid by the cultivator shovels were taken to town to be sharpened. When they were brought back they were greased and hung up, ready for use the next season.

His farm had many advantages not possessed by all and one of these was a concrete floor in one end of the large horse barn. One corner of this he used as a work shop. Along one side of the barn he had his work bench and a number of tools were hung on the wall in back of it. On a shelf above the bench were two cans of oil and several brushes. One can held harness oil and the other waste crank case oil for greasing tools. Whenever a spade or hoe or the like was used and returned it was cleaned off, rubbed with an old sack or some waste, and given a daub of oil. Tools and, in fact, much machinery seldom wears out; it more often rusts out. Greasing prolongs the life and makes a tool much easier to work with. It is but a matter of a few seconds to do this every time a tool is used, once a person gets the habit of it.

On one end of the work bench was a small home-made cabinet with each drawer labeled. Here he kept screws, washers, bolts, rivets, rawhide, buckets, and such for repairing harness; tacks, hog rings, and such like. Along the back of the bench was a row of compartments for nails of different sizes, each size in a separate compartment.

A boughten and one home-made chest held tools such as a rip and cross-cut saw, squares and level, planes, a set of chisels, and a set of bits in a special box, hammers, wrenches, and so on. When he wanted a tool he knew where to find it and it wouldn't be rusted either. His chisels were kept sharp and put away in that condition. An oilstone and an oil can on the bench left no excuse for not keeping them ready for use, and doing it then.

One end of the bench lacked several feet of meeting the wall. A strip of 1 in. by 4 in. across here made a place to stand shovels, axe, crow bar, rake and hoes, pick-axe, and short pieces of boards.

The log chains, pieces of rope, extra halters, and coils of wire were hung on separate pegs. If a rope or chain was wanted there was only one place to look for it. The same was true of the sacks which were in one place, laid over a wire between two studs on the wall.

Extra harness and pieces occupied another corner. All pieces of lumber that could be used were over the drive in the wide double corn crib or piled on two braces under the work bench. An old barrel was used as a junk catcher. This held the old tin cans, broken sections, rusty and bent nails, and such.

When the grain was cut the binder was put in the barn and looked over. If any repairing was necessary it was done then and everything was in readiness to start cutting next season without delay. The same was true after haying was over. The mower and hay loader not left standing in the field or barnyard until winter but put away ready to use when needed.

This man knows what he has, where to find it, and in what condition it is. No guesswork about it. His system does not cost anything but it is a time and step saver and can be duplicated on any farm. A collection of scattered tools and making some corner of a building a "shop" is a good system for everyone to have.

Iowa. A. M. WETTACH.

Ayrshire Breaks South Dakota Record

Starting her Advanced Registry record at four years and 265 days of age, Wisconsin Dairy Queen, an Ayrshire, becomes the champion producer of the state with 14,772 lbs. milk, 533.37 lbs. fat. Queen is owned by the Lampe Market Co. of South Dakota.—Ayrshire Breeders' Association.

MORE MILK—MORE BEEF

Feed Home-Grown Crops

Stop that monthly feed bill. The Letz Dixie will cut, grind and mix anything grown—makes a perfectly balanced ration from home-grown crops. Guaranteed to increase production from 15 to 30% and cut feeding costs from 25 to 50%. A warehouse in every state.

EDITORIAL COMMENT

THE U. S. Department of Agriculture gives notice that there is another outbreak of foot and mouth disease in two counties in California, Tuolumne and Los Angeles, which involves six herds. These outbreaks occurred July 2, 4, 5, and 6.

It was hoped all the infection of foot and mouth disease had been buried and we were free from it, but it is perhaps expecting too much that a plague of this kind be quickly destroyed. This proves it a very infectious disease and that the greatest care must be exercised to suppress it.

The state and federal veterinarians are giving close attention to restocking farms that have been infected. They are using a few hogs and calves to determine whether there is any dormant infection, before permitting additional stock to be brought on the farm. It would seem every precaution is being taken to destroy foot and mouth disease contagion, but it still persists in a few places.

TUBERCULOUS CHICKENS

Several owners of accredited herds have been much disturbed in finding some of their hogs infected with tuberculosis. This has caused them to wonder if the tuberculin test has given a proper diagnosis of their herds or whether some animal, suffering from tuberculosis, has failed to respond to the test.

Investigations by the Bureau of Animal Industry have been made in several instances and it has found that hogs coming from farms owning accredited herds have been infected with the avian type of tuberculosis. It is common knowledge that chickens suffer from tuberculosis but not of the bovine type. It is a type which affects birds, and it is capable of being transmitted to swine.

The Bureau of Animal Industry recommends killing chickens showing signs of being unthrifty. It would be our suggestion that a post-mortem be held on chickens that have been killed because unthrifty, in order to determine whether they are suffering from tuberculosis. If they are, it would be better to dispose of the flock, clean the premises, and replace them with healthy chickens.

PAYING COWS

The second annual report of the Mt. Hope—Lancaster, Wisconsin, Cow Testing Association contains much valuable information. It sets forth clearly the different results obtained by the members of this organization. Twelve cows in 1923 produced unusually well. The lowest cow of this number produced 464.9 lbs. fat in a year; the highest made 810.7 lbs. The lowest cow in the association produced only 131.6 lbs. of fat. The high producing cow gave an income above cost of feed of $268.89; the low producing cow, $21.57. The one high producing cow was equal to a dozen of the low producing cows. These cows were owned by practical dairy farmers and kept for profit.

It must be admitted that the cow that produced 810 lbs. of fat in a year is an unusual animal and we cannot expect the average herd to equal this record, but it is ridiculous to hang on to cows capable of producing only 131 lbs. of fat.

In this same association there were 16 members whose herds averaged more than 300 lbs. of fat, the highest average being 469.5 lbs. The best herd returned an income above cost of feed of $144.36 per cow and the lowest of these 16 herds, $71.13. When 16 herds in one cow testing association average better than 300 lbs. fat per cow, the standard of 300 lbs. fat per year, on the average, is not too high for all dairy cows.

BACON HOGS

American bacon sells for 5 cents less a pound in the English market than does the Danish bacon. The extra price which the Danish farmer receives for his hogs, because they sell for a better price than the American hog, makes it possible for him to purchase 75% of his feed and at a higher rate than the American farmer pays for his feed. The freight on feed from this country to Denmark amounts to nearly $20 a ton. The Danish farmer has developed a special bacon hog and 60% of the live weight of hogs is made into bacon. It was a surprise to us to learn that such a high percentage of the hog could be made into a grade of bacon favored in the English markets.

The bacon hog is well balanced; it has an even distribution of flesh. He is not a bony structure with a high percentage of lean meat, but rather an animal with the proper proportions of lean meat and fat and a nice covering of fat on the back. The best bacon is obtained by feeding a ration consisting of about 60% of barley and 40% of oats, supplemented with a liberal amount of skimmilk and green feed. If skimmilk is not available, whey can be used and if neither of these by-products of the dairy can be obtained, then tankage. Corn is sometimes fed, but not more than 50% of the hog's ration should be made of corn. The remainder should be skimmilk and barley. Corn alone will not produce choice bacon. Hogs raised on what is termed a corn ration will be too fat.

PRODUCERS OF SURPLUS

"Thirty per cent of the cows in testing associations during 1922 did not return a net profit, although these herds averaged 61 per cent higher in production than the general run of cows in the state." This statement is found in Extension Bulletin No. 22 of the University of New Hampshire. This bulletin contains the records of 1,656 cows that in a year produced an average of 6,100 lbs. milk containing 244 lbs. fat. According to the bulletin, New Hampshire has 96,000 dairy cows and of these probably not over 50,000 are producing enough milk to warrant a profit. The remaining 46,000 are the surplus producers, and the product from these profitless cows determines the value of the product from the economical producers. Excess production lowers the price of the total crop, thus acting as a drag on the herds which are made up of individual profit makers.

No wonder a committee appointed by the New England Milk Producers' Association, to study a plan to remove the burden of surplus milk, stated that no method of marketing could be devised that would bolster up inefficient production methods. The elimination of the poor and unprofitable cows and a larger production of legume hays will do more to sustain the prices of dairy products and make dairying profitable than any other factors within the control of the dairy farmer.

We wish some of our readers would write us, stating why it is so many farmers keep cows that will not pay for feed consumed. Wherever the dairy cow is studied, invariably one-third of them are found unprofitable.

SWEET CLOVER vs. BLUEGRASS

Bluegrass pasture is so prevalent in a large section of our country and grows under so many soil conditions that it has been our chief pasture grass for years. It is a grass that comes on early in the spring and invariably provides late fall pasture. During the months of July and August bluegrass pastures are invariably short and this requires that the cows receive considerable feed from other sources. Bluegrass pastures are frequently neglected and as a result it requires more than an acre of land to carry a cow through the pasture season.

Professor W. J. Fraser of the University of Illinois, who has been devoting himself to the economical production of milk, has found that sweet clover will produce much more feed per acre and provide good pasture for a much longer period than bluegrass. Upon investigating the experiences of successful dairymen, we have found sweet clover a most satisfactory legume for pasture purposes. Professor Fraser has found that three-fourths of an acre of sweet clover will provide pasture for one cow for a period of six months and in some instances it requires less than three-fourths of an acre to provide all the feed a cow requires for making more than 50 lbs. milk per day. He has found many cases where practical dairymen have sustained high production for several months and the cows received nothing but sweet clover pasture. At first the cows may not take kindly to sweet clover but they soon learn to like it and it would seem that when their taste becomes cultivated to it, they like it fully as well if not better than bluegrass.

We are publishing a series of articles by Professor Fraser under the general title "Ever Failing or Never Failing Pasture". We commend these articles to the attention of those who desire to get larger returns from their cows when on pasture and for securing larger yields of feed per acre.

WHY NOT TEST STEERS?

The work of tuberculosis eradication is making splendid progress. Recently two counties in Kansas were declared free from tuberculosis. This means that all the herds in these counties have been tuberculin tested, reacting animals eliminated, and that there is less than 1 per cent of tubercular animals left in the county. These counties have passed the following resolutions:

"WHEREAS, since all of the dairy and breeding cattle and all other cattle located in Leavenworth County, Kansas, have been tested for tuberculosis in accordance with the rules and regulations governing modified area testing; it is therefore ordered:

"1. That no dairy or breeding cattle can be shipped into Leavenworth County, Kansas, without first having been tested for tuberculosis by a veterinary inspector of the Bureau of Animal Industry, U. S. Department of Agriculture, or an accredited veterinarian of the state where the cattle originate.

"2. Beef cattle to be used for grazing or feeding purposes can be shipped into the county on an affidavit that they will be kept segregated from all tuberculin tested cattle located in Leavenworth County.

"3. Anyone violating any of the provisions of the foregoing rules and regulations will be subject to the pains and penalties of the law."

It is our belief that all cattle coming into modified areas, regardless of what use is to be made of them, should be tuberculin tested. It is our opinion, based upon considerable evidence, that shipping in steers for grazing purposes has been the means of reinfecting clean herds.

Since it is an easy matter to apply the intradermal test, why not use it and not permit any animal to enter a modified area unless it has passed the tuberculin test? This would work no serious hardship on those who desire to feed cattle and it would eliminate one source of spreading contagion. One of the drawbacks to tuberculosis eradication work has been the failure to stop all source of reinfection. The farmers of this country now favor the eradication of tuberculosis but if those in charge of this work are careless and permit herds to become reinfected, there may develop the opinion that there is no use to attempt the destruction of this scourge.

Driving a herd of steers, which has not been tested, along public highways, placing the steers in pastures where they come in contact with other cattle or permitting them to drink from streams which may lead through pastures where clean herds are kept, may spread infection, and when it is considered that the expense of applying the intradermal test is small, we see no reason for taking these chances.

Installing Lightning Rods

I have a house equipped with lightning rods which I now expect to improve by covering with stucco. Will it be all right to imbed or cover the lightning rods with stucco, or should they be removed and then replaced after the stucco is put on?

Cambridge, Minn. A. P.

We recommend that the rods be placed on the exterior of the stuccoed wall in preference to embedding them. The rods are then open to inspection, and, of more importance, their contact with the surface renders them more effective in grounding the electrical charge thereon, particularly when the walls are wet. Should a severe stroke of lightning ground through rods embedded in the walls of a building, it appears probable, although we cannot cite any direct evidence, that some disruption would occur. A conductor on the surface evidently can move to a considerable extent, particularly a copper cable, and thus accommodate itself to the stresses set up with the passage of a heavy lightning discharge.

U. S. Weather Bureau. C. F. MARVIN.

Grain to Feed With Sweet Clover Pasture

Please give correct grain ration for dairy cows. We have sweet clover pasture and feed little alfalfa hay. We can buy wheat bran, corn meal, cottonseed meal, ground barley. We feed bran and a little cottonseed meal and corn chops.

Albuquerque, N. M. H. S.

When cows are on sweet clover pasture and are receiving a little alfalfa hay, it is an easy matter to make a mixture to supplement these two good roughages. It would be our suggestion to make a mixture consisting of 300 lbs. corn chop, 300 lbs. ground barley, and 200 lbs. wheat bran, and from 50 to 100 lbs. of cottonseed meal. This latter feed is not essential but it gives variety and if there is some on hand it might be well to use this small amount. Feed one pound of the mixture for each 4 or 5 lbs. of milk produced.

We have assumed the pasture is reasonably good; otherwise we would have suggested feeding more grain. We may also add that cows well along in their period of lactation and in good flesh will undoubtedly do very well if no grain is fed to them.

Feeding Cows on Pasture

Kindly figure out an economical and satisfactory ration for Holstein cows with feed at the following prices: We intend to feed 35 lbs. corn silage and 12 lbs. clover and timothy hay: Corn, $1.10 per 100 lbs.; oats, $1.35; bran, $1.25; oil meal, $2.30; cottonseed meal, $2.10. Also send a grain ration for cows on bluegrass pasture.

Fort Atkinson, Iowa. A. K.

When cows are on pasture, a mixture consisting of 300 lbs. ground corn, 100 lbs. bran, and 100 lbs. oats will supplement the grass very well. The amount of feed will depend upon the quality of the pasture, the kind of cow, and her period of lactation. About one pound of meal mixture for each 4 to 5 lbs. of milk produced, when pasture is good, is considered rather liberal feeding.

For a winter ration we suggest the following: Let the cows have all the silage they care to consume or, say, 35 lbs. per cow per day, and a liberal allowance of the clover and timothy hay. A mixture consisting of 300 lbs. ground corn, 200 lbs. bran, 200 lbs. ground oats, and 100 lbs. oil meal will supplement the roughage fairly well. Feed one pound of this mixture for each 3 to 3½ lbs. of milk produced. We have assumed the clover and timothy is about a 50—50 mixture.

Oak Leaves Poisonous

It has long been claimed by stockmen that cattle especially are poisoned by eating the leaves of scrub oak. In a few instances examination of these cases indicated that the animals were affected with hemorrhagic septicemia, leaving some doubt as to the reality of poisoning.

To determine this point an experiment was recently conducted on the ranch of Mr. Hugh McKee, six miles south of Trinidad. Oak brush was cut and fed to cattle in a corral with no other feed, but plenty of water. During the first few days the cattle consumed the brush greedily and it was difficult to keep a supply before them at times. On the eleventh day they refused to eat the oak brush, appeared gaunt, were constipated, and eye balls were retracted. On post-mortem, lesions of hemorrhagic enteritis were most conspicuous. The intestinal contents were very dark colored, soft, and mushy.

Both the symptoms and post-mortem findings conformed to previous reports of poisoning by scrub oak. It may be considered as settled that scrub oak is very injurious to cattle, and how to counteract its effects or prevent cattle from eating it constitutes a real problem.—GEO. H. GLOVER, Colorado Agricultural College.

Feeding Grain On Pasture

Many dairymen are asking the question, Does it pay to feed grain on pasture? Dr. C. H. Eckles, chief of the division of dairy husbandry, University of Minnesota, says the answer depends upon the amount of milk the cows produce and the condition of the pasture.

"A small milk producer will not pay for grain in addition to pasture," says Dr. Eckles, "while with a heavy producer it is a serious mistake not to feed some grain under all conditions. A cow producing 35 lbs. daily of average milk requires about 30 lbs. of dry matter in her feed. Fresh pasture grass contains not over 20 lbs. to the hundred. A cow producing the moderate amount of 35 lbs. daily will require then at least 175 lbs. of grass daily. The physical exertion necessary merely to gather this amount of grass and chew and digest it is clearly a hard day's work. It is possible under the most favorable conditions for a cow to gather and digest this much feed. Only too often, however, the grass is short and it becomes clearly impossible.

"Experiments have shown that with a small producing cow, for example one milking 20—25 lbs. daily, the feeding of grain gives only about an additional pound of milk for each pound of grain. The economy of this is questionable. However, it has been found that the returns of grain feeding do not all come at the time. Cows fed grain in pasture milk decidedly better the following winter on account of being in better condition by fall. This should be taken into account in considering the advisability of feeding grain during the summer.

"It is clear that no cow can produce a really liberal amount of milk for any length of time on grass alone. Sometimes they will do it for a while by drawing on their reserves, which means losing weight and condition with poor results later on."

Cow testing association reports show that the feeding of grain to dairy herds pays on Minnesota farms. A compilation of these reports by E. A. Hanson, who is in charge of cow testing association work in the state, shows that 1,231 cows receiving no grain on pasture averaged 228 lbs. fat per year at a feed cost of $41.87, as compared with 572 cows receiving grain that averaged 296 lbs. fat per year at a feed cost of $49.35. These figures show that for $7.48 additional spent for grain to feed during the pasturing season an additional return per cow of 68 lbs. of fat was realized worth $19.72 at 40 cents per pound.

Dr. Eckles' recommendations regarding the feeding of grain are as follows: Guernsey or Jersey cow producing 20 lbs. daily, 3 lbs. of grain; 25 lbs. daily, 4 lbs. of grain; 30 lbs. daily, 5½ lbs. grain; 40 lbs. daily, 8 lbs. of grain. Holstein, Brown Swiss, Ayrshire, or Shorthorn producing 25 lbs. daily should have 3 lbs. of grain; 30 lbs. daily, 4 lbs. of grain; 35 lbs. daily, 5½ lbs. of grain; 40 lbs. daily, 7 lbs. of grain; 50 lbs. daily, 9 lbs. grain. For higher production about one pound to each four or five of milk produced.

"It should be kept in mind that these recommendations apply only when pastures are good," says Dr. Eckles. "If pastures are short, as is often the case in late summer, some roughage or silage is also needed. When the amount of grain fed is small, any farm grains such as corn, barley, or oats serve the purpose. The grass supplies a liberal amount of protein.

"When liberal grain feeding is necessary, for example, six pounds or more daily, some attention must be given to including more protein. For a very heavy milking cow receiving a large grain ration the same mixture as used for winter feeding would be suitable."—Minnesota College of Agriculture.

Italian Cheese

I would like to know how to make Italian cheese.

Bellaire, Ohio. W. G. M.

Italian cheese are of many different varieties. One of the most prominent is Gorgonzola, a blue mold variety that is ordinarily made about 12 in. in diameter and 4 in. high. We take the following description of method of manufacture from Publow's book entitled "Fancy Cheese in America":

"Gorgonzola cheese is made equally well from the milk of cows and goats. It is made from two separately made curds, similar to the procedure in making Stilton cheese. Fresh, clean morning's milk is brought to a temperature of 82 degrees F. and coagulated by the addition of 4 ounces of rennet extract to each 1,000 lbs. of milk. When firmly coagulated, it is cut into very small pieces and placed in draining cloths in a curd sink. Every hour during the day the cloths are tightened about the curd to assist in expelling the whey. In about 8 hours from the time of adding the rennet the curd is cut into pieces about 4 inches square and left under a cotton cover till the following day.

"The night's milk is made up in a similar manner, but instead of cutting the curd into pieces 4 inches square, it is broken up and mixed with the curd of the morning's milk. A small quantity of moldy bread crumbs is also mixed with the curds. The idea of mixing the older curd with more acid and the newer one is to secure a more or less porous body in the cheese, as two curds of different temperatures and acidity do not unite as readily as the particles of a single curd. The open body is conducive to a growth of mold in the cheese. This is stimulated by the addition of moldy bread crumbs, which act as a "starter".

"After the curds have been mixed they are packed loosely into the forms, which are lined with cheese cloth, and placed on straw matting. The curd is not pressed. It is left to unite under its own weight. To bring this about, the forms should be turned every few hours for about 5 days and clean cloths put on occasionally. When the cheese have assumed their proper form they are placed in a moist room, at 68 degrees F. In 2 or 3 days a fine growth of white fungus will have started on the outside. This indicates that the cheese are ready for salting. The surface of the cheese is then entirely covered by gently sprinkling on the salt and then rubbing it in with the hands. Salt is applied in this manner each day for at least 14 days. When this process has been completed the texture of the cheese should be examined. If it is too close to permit the proper growth of mold, the cheese is pierced a number of times in both ends with metal skewers. The holes thus formed admit oxygen, which is necessary for the growth of mold. The cheese are then placed in a moist curing room, at 55 degrees F., upon straw mats, and turned twice a week until 12 weeks old, when they should be ready for market. In Italy the cheese are cured in caves, where a soft breeze continually blows. During the ripening process several varieties of mold grow on the outside of the cheese, but this coating is removed before the cheese are prepared for market."

Another Italian cheese is known as Caciocavallo. It weighs about three pounds and has a peculiar shape, resembling the sole of a shoe. Publow gives the following description of its manufacture:

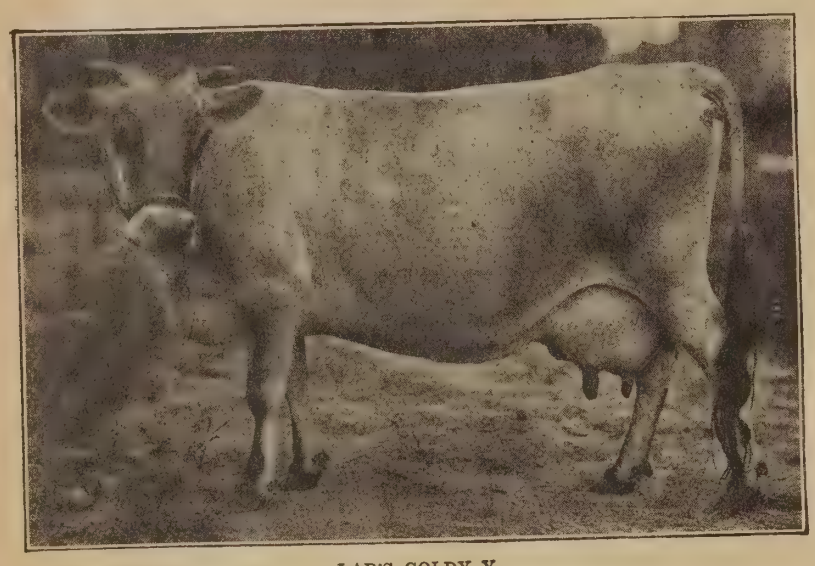
"Three parts separator skimmed milk and one part whole milk are placed in a cheese vat, heated to 90 degrees F., and ripened by the addition of ½ per cent to 2 per cent commercial starter or buttermilk to an acidity of .21 per cent. Rennet extract, diluted in cold water, is then added at the rate of 2 ounces per 1,000 lbs. of milk. In 25 to 30 minutes the milk should be firmly coagulated, when it is cut into small cubes by the regular Cheddar curd knives. The curd is not stirred, but is allowed to settle to the bottom of the vat, where it remains for several hours, or until the acidity of the whey reaches .50 per cent. Direct steam is then turned into the whey and the temperature is raised to 165 degrees F. This temperature is maintained for 20 minutes, and during this time the curd is stirred with an iron rake. The whey is then removed and the curd kneaded by hand until all free whey escapes and the texture becomes stringy. It is then molded by hand into the desired shape and placed in a salt brine, strong enough to float an egg, for 2 or 3 days. When removed from the brine the cheese are suspended in pairs, from hooks in the ceiling, by cords tied tightly round the cheese about 2 inches from the end. While hanging from the ceiling they are lightly smoked with the smoke of burning wood and transferred to a cool, dry room where they remain suspended until ready for market. During the curing stage the cheese become hard and dry, and it may be necessary to rub the surfaces occasionally with boiled linseed oil to prevent their cracking. Caciocavallo cheese may be marketed when 2 months old, but remains in good condition for years. It is very seldom eaten in large pieces but is grated and used for making macaroni foods and for flavoring soups."

A Minnesota Jersey Gold Mine

W. H. KIRKWOOD, MINNESOTA

MINNESOTA, long known as "The Land of Ten Thousand Lakes", has also carried the reputation of being a great mining state due to immense production of iron ore in the range country, and, last but not least, enjoys the enviable reputation of being the "Greatest Butter State in the Union".

With such a setting it seems fitting that a Jersey cow, in the University herd, should be given honorable mention as one of the good butterfat producers in the state.



Lad's Goldy Y was born September 10th, 1909, in the herd of H. C. Young, Nebraska. On September 2nd, 1914, she became a member of the University of Minnesota dairy herd, having been purchased by M. D. Munn for that institution for $300. Goldy Y had dropped three calves prior to entering the University herd, two males calves, and one female that died shortly after birth. On June 11th, 1915, she calved and has calved regularly every year with a total of nine progeny in Minnesota. Of this number, four sons and one daughter are alive, the daughter being in the University herd, the four sons in service in the state. Her six sons sold for a total of $1,800 and in each instance have been the direct means of developing an outstanding herd of dairy cows.

Beginning June 13th, 1915, accurate milk weights and butterfat records were kept on Goldy Y, and up to the present lactation she has produced a total of 66,327.9 pounds milk, 3,546.04 pounds fat, or an average of 8,280.9 pounds milk, 443.25 pounds fat per year. She has never been milked more than twice per day. She was tested officially at seven years of age, producing 12,176.4 pounds milk, 669.52 pounds fat in 365 days, carrying calf 181 days.

Production Record of Lad's Goldy Y

Period	Days	Milk	Test	Fat
		Lbs.	%	Lbs.
June 13, 1915—Aug. 16, 1916	459	9,802.3	5.6	556.41
Oct. 18, 1916—Dec. 31, 1917	434	13,168.0	5.6	774.40
Feb. 1, 1918—Jan. 31, 1919	365	8,307.0	5.4	453.30
Mar. 8, 1919—Dec. 31, 1919	328	8,312.6	5.3	446.09
June 1, 1920—Mar. 6, 1921	279	6,763.6	5.0	339.08
Apr. 4, 1921—Dec. 20, 1921	290	5,831.6	4.8	278.95
Mar. 16, 1922—Nov. 30, 1922	258	7,270.7	4.6	344.75
Feb. 1, 1923—Nov. 5, 1923	278	6,809.1	5.2	353.06
Totals	2,691	66,327.9		3,546.04

Goldy Y's usefulness does not end with production and reproduction, for her outstanding dairy characteristics have given her a wide reputation. During the ten years of her life in the University herd she had been handled and studied by approximately five thousand students in dairying; and each year during the "Farmers' Week" has had her hide pinched and udder handled by at least 1000 farmers in an attempt to familiarize themselves with the outstanding points of a dairy cow.

LAD'S GOLDY Y

"Adapted for Dairying." A look at a cow of this type is all that is necessary to know that with the proper feed and care she is capable of large and economical production. Note the large barrel giving room for feed, splendid dairy form, large mammary development, and indication of constitution and vigor. She also has a pleasing appearance.

Indiana State Dairy Association Annual Field Day

The fifth annual summer field meeting of the Indiana State Dairy Association will be held at Kendallville August 6th and 7th. The Noble County Farm Bureau and civil organizations will co-operate with the State Dairy Association to make this one of the biggest summer field meetings in the history of this annual summer program.

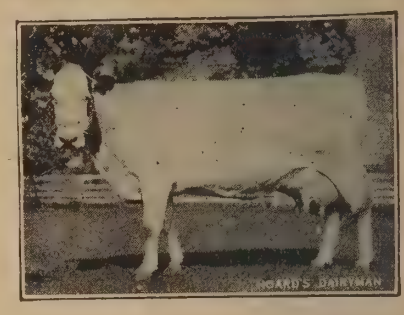
The program, including talks by prominent men, a dairy cattle show, and two dairy tours, will justify the attendance of all members of the association and all others interested in dairying. The following day, judging of Jersey and Holstein cattle will begin promptly at 9:00 a. m. at the Kendallville Fair Grounds. There will be a total of 9 classes in each breed. The premiums total over $500 for the show herds, and in addition $250 for the Holstein and Jersey Calf Club Show.

It is the purpose of this summer session to put the Holstein and Jersey type before their respective breeders and dairy farmers, to apply the extension methods more directly to the farmer through the county farm bureau, to acquaint dairy farmers of the state with the factors in successful dairying, to show the relation between a city and the rural community, and to bring progressive dairymen of the state together.

Indiana. E. A. GANNON.

A Rangy White Heifer

HOARD'S DAIRYMAN:—This is a story of a leggy, rangy white heifer and a former ditch digger for the Standard Oil Company. The story was told to me recently by Professor Oscar Erf of Ohio State University.



M. J. Dunn labored on the ditch lines of the Standard Oil Company for 26 years. Doing this he made a living and a little besides but, not getting ahead very fast and wanting a change, he decided to try farming. Presumably the shift was made as much in the interest of a change of work as it was in the hope of greater financial return. Being removed from the farm for 26 years Mr. Dunn's original knowledge of farming had become rather hazy, but he put his savings into 118 acres in Huron County, Ohio, part of which was his old home farm. The soil on this 118 acres was mostly a tight clay, infertile and hard to work and not more than medium in cropping possibilities. The pasture, however, was good. The buildings were old and dilapidated. The place was run-down and an eye-sore.

After moving on the farm Mr. Dunn, not having much money, started in the dairy business with a grade herd. This, he thought, would be the best means to build up the soil fertility as well as to promise most profit. Mr. Dunn could not convince himself that pure-breds were a better investment than grades although there were quite a few pure-breds in the community. Grades, he thought, would do.

Mr. Dunn's greatest difficulty was a lack of knowledge about feeding. He kept close check on production because as an oil company employe he was for a while timekeeper on the ditch lines. This made keeping records easy for him. The records showed him that somehow his herd was not yielding much profit. Discovering this he began to think more about pure-breds. He wondered if after all they might not pay. He decided to find out.

After selling his grade herd, Mr. Dunn, still dubious but not discouraged, went to LaGrange and attended a pure-bred Holstein sale. There were many good cattle sold that day and eager buyers bid prices high. Finally a long-bodied, tall, white heifer was led into the ring. She was not of beautiful type and her body markings were not just right. Most buyers shunned her but Mr. Dunn bid her in at $255, a price lower than the sale average, and he got her. This animal was White Beauty Pontiac Mahomet.

The neighborhood about Wakeman is not exactly well known as a dairy community. Although there is a cow testing association there and many good herds are found, none of them are famous. The cow tester along with his other regular duties has introduced many successful feeding

WHITE BEAUTY PONTIAC MAHOMET, OWNED BY M. J. DUNN, OHIO

This pure-bred Holstein was purchased as a heifer by a ditch digger turned farmer. He studied feeding her under a cow tester and she produced 32,626 lbs. milk containing 1,094 lbs. fat.

rations. Although Mr. Dunn could see no need of joining the association he was interested in finding better ways to feed his cows. He began to take heed of some of the practices the tester was advocating and in due time his opposition broke down and he joined the association.

About this time White Beauty freshened and began producing a big flow of milk. The tester observed that the cow was receiving a grain ration of only corn and oats and a poor quality hay while producing this good flow. She was getting no alfalfa. The tester wondered what the cow could do if she were given a better chance. He thought she could make the Advanced Registry and told Mr Dunn so. Although the owner did not think the cow was capable of such a test he continued to develop her by better feeding. Under this care she came on wonderfully and on January 30, 1923, Mr. Dunn was persuaded to try her for Advanced Registry.

He began feeding then, under the direction of the tester, a ration of hominy, gluten, oats, bran, linseed oil meal, beet pulp, and salt. She was given this ration until pasture time when the beet pulp was discontinued but the grain ration was continued. She was milked four times a day and was watched very closely to keep her from going off feed. She was weighed often to keep her weight as constant as possible. Mr. Dunn fed only ground grain and in order to get the best quality of hay he cut the crop just before the seed pods hardened. After the pasture season was over beet pulp was again added to the ration.

White Beauty completed her test last January 30. In 365 days she made 32,626.3 pounds of milk and 1,094 pounds of fat. The rigorous feeding instead of breaking her had developed her. At the present time White Beauty Pontiac Mahomet looks nothing like the racy heifer that was turned down by the big breeders at the auction and picked up, with some misgivings, by Mr. Dunn. She now weighs 1,550 pounds and, in the words of Professor Erf, has a type "as good as can be found". And incidentally she has made M. J. Dunn, former ditcher, well known among Ohio Holstein men.

Ohio. C. A. BROWN.

Good Cows Profitable and Interesting

HOARD'S DAIRYMAN:—Peter Bastian of Illinois has a registered Holstein cow recently purchased at Milky Vale Dairy Farm, that has made the following remarkable records: In February, March, and April she produced 6,491 lbs. milk which netted Mr. Bastian $189 after paying transportation charges. She averaged over 70 lbs. daily for the 90 days, going up to 81.2 lbs. her best day. She produced five times her own live weight in milk in the three months. In March she gave 38 8-gallon cans of milk. Her daily average was enough to supply 35 families with a quart of milk each morning.

Yet more vivid are the facts when considered on a food production basis and compared with that of a steer. A quart of milk is equal in food value to 12 ozs. of steak. A steer gaining two pounds daily requires three years and 121 days to produce 2,433 lbs. of steak, the equal to 3,245 quarts of milk which this cow produced in 90 days. Or, it would require nearly 14 steers to keep pace with the cow during the 90 days. Consider the feed required for them as compared with what one cow could consume.

This cow is seven years of age, has freshened five times, and has two sons and four daughters, all living, one having a pair of twins. Last year in the cow testing association she had a record of 16,070 lbs. milk and 490 lbs. fat during her lactation period. She returned $360 in addition to a pair of calves. She has an official record of 21 lbs. butter in seven days made at second freshening.

Illinois. LOUIS H. KLAAS.

GRADED MILK IN ENGLAND

F. A. LEJENNE, ENGLAND

THE grading of milk has been an established practice in American cities for many years, but in England it is a comparatively new idea. Before the great war neither public authorities nor medical commissions in England made any attempt to grade milk; in fact it may be said that such a thing was hardly ever mentioned. There were individual dairymen who made every effort to produce the best class of milk and who were able to build up a reputation accordingly, but they were few and far between. In the poorer districts of the great cities there were doctors and far-seeing healthworkers who realized that the children never got enough milk to give them a fair start in life, and the quality of what they got was usually far from reliable and was made worse by storage afterwards in unhygienic homes. When these people suggested that something might be done, they were met by the old, unreasonable argument, "There are reasons against it; the trade is too complicated to institute any kind of control".

This theory, however, like many another, came to grief on the hard facts of war. There was one man (Wilfred Buckley of Moundsmere in Hampshire) who for years had studied the production of clean milk. In his travels he had studied the methods in use in New York State, and he had applied them on his own farm in Hampshire and so had built up a reputation for the quality of Moundsmere milk. Early in the war, being unfit for military service, he felt that he must "do his bit" for his country, and he decided to push forward the improvement of the milk supply in the hope of saving a few infant lives in the years when the loss of life was so appalling. A little later, when the Ministry of Food was rationing the whole country, a man was needed to direct the Milk Section of the Ministry. Buckley undertook the work, a colossal task which meant controlling all the milk in the British Isles, whether in liquid or preserved form. In this work he was ably seconded by James Mackintosh of University College, Reading. The question of fixing wholesale and retail prices soon arose, and when all prices were controlled it was decided to allow a special maximum price, higher than that of ordinary liquid milk, for milk of "exceptional hygienic quality". So for the first time in England was it officially recognized that milk can and should be graded according to its cleanliness and purity.

After the war, the Ministry of Food died a natural death, but the grading of milk was continued as an emergency measure by the Ministry of Health. Control by a government department had proved a practical and successful proposition. After much abuse and discussion, milk grading was sanctioned by Act of Parliament, as distinct from its previous position of a temporary expedient only. There were three main points of view: (1) That grading was not practical and not much use anyway, (2) that milk producers and retailers should be forced to clean up, under threat of dire penalties, and (3) that the existing grading should be carried on which meant the government giving official recognition, with adequate safeguards, to those who voluntarily produced milk of the high standard required.

The third point of view carried the day; experience had proved the scheme feasible. On the other hand, it was felt that public opinion was not ripe for compulsion in milk hygiene, and that any law which attempted it would come to grief. Time is proving the wisdom of the decision. There have been, unfortunately, several changes in the names of the grades and in the conditions attached to them, but some adjustment is always required when starting a new machine.

A short description of the grades may make an interesting comparison for those engaged in similar work in America. It must be understood that all the grades are voluntary—nobody need go in for them unless they wish. Where it is desired to do so, the Ministry of Health, or in some cases local authorities, grants a license for the production or retailing of the particular grade, and it is only when a license has been granted that the dairyman may sell such a grade. Licenses cost from $1.25 up to $25 per year according to the class of milk sold, and whether the applicant is a producer or retailer. The prices for the sale of graded milk are not priced now as they were during the war.

"Certified" milk must come from cows which have passed the tuberculin test twice yearly. It must be bottled on the farm where produced, be retailed within 48 hours at longest, and not contain more than 30,000 bacteria per cubic centimeter at any time before delivery to the consumer. The average retail price is about 26 cents per quart.

"Grade A (tuberculin-tested) milk" has to come from cows tested the same as above. It may be shipped in bulk to the retailer, who must bottle it before distribution, with a bacterial content of not more than 200,000.

"Grade A" milk is the same, only there is no T. B. test, a clinical examination being substituted. There is not much of this on the market, as the public, if they want graded milk at all, want to be sure it is free from tuberculosis. Grade A (T. B. tested) milk has an average retail price of about 18 cents a quart, but it is so new a thing that prices have hardly found their level yet.

The above three grades must not be treated by heat, unless officially "pasteurized" and certified milk must not be even pasteurized. Pasteurized milk, if sold as such, must be treated by the holder process, in a plant which has been passed by an inspector of the licensing authority. The writer does not know of their being any "grade A pasteurized" on the market, and the public likes its grade A milk raw. Pasteurization will probably be reserved for market milk. Much of the commercial milk sold is pasteurized in one way or another, but no official sanction is given to the flash process, which is usually of little value to the public. The small retailer as a whole does not look with favor on these grading schemes, nor even on milk being sold in bottles at all. He feels he is at a disadvantage as compared with the big dairy companies. But he has to move with the times and there is no question that the discerning public is only too glad to pay a little extra (ordinary milk averages about 14 cents per quart), for a milk with a government guarantee behind it.

IN THE DAY'S WORK

WASTE

ELWOOD ERICKSON, NEW YORK

ONE of the most baffling incidents in the business of life is the portentous and ever present sense of waste. As we sum up the total of our labors, so few of them apparently bear fruit. Much effort is futile without compensation. And especially in that realm where results are indefinite. In our efforts to be kind we are too often met by ingratitude of which it has so bitterly been said, "Blow, blow, thou winter wind. Thou art not so unkind as man's ingratitude." We want to be generous and some suspicious man thinks that we have an axe to grind. We yield to an unrestrained affection and too often are met with cynicism.

Love's labor lost, goodness unrequited, this sense of futility is responsible for much of the unbenevolence which exists in the world today. It closes up the pores of human kindness, it restrains that generous outpouring of the human spirit toward our fellow men. We ask ourselves, why risk the wounding of our spirits, why cast our pearls before swine? Why should we not draw up within ourselves, live a well ordered, sagacious, prudent life, and let the rest of the world go by? Many people arrange their lives on such a program as this, safety first.

And yet as we look a little deeper into this matter of waste, we find that the doctrine of safety first does not cover the case, rather that is at direct variance with some of the fundamental facts of life itself.

Among other things, we soon learn that one of the first rules of effective living calls for risk. We are forced to risk the possibility of waste. We must risk ineffectiveness. The old adage, nothing ventured, nothing gained, must also be considered.

We must take the risk, for life is risk. This gives the zest and joy of living.

"No game was ever worth a rap
For a rational man to play
Into which no accident, no mishap,
Could possibly find a way."

Or, we face that other strange fact in the business of living that there is really, in the last analysis, no such thing as waste. A wise man once said, "that a weed is a flower for which we have not as yet found a use". At the time, things unfruitful, but in the long run, they work themselves into the constructive plan of life.

A good deed is never really wasted. It may be unappreciated at the moment, its effects may be long in appearing, but finally it works itself into the confederacy of human good. In Longfellow's poem, the song breathed into the air was sung and forgotten but long years afterwards it was found in the heart of a friend.

At a banquet in London, Lord French introduced General Smuts of South Africa. The latter related an incident of the Boer War. He was commanding the forces that had been defeated by the British. He gathered the decimated band into the mountains. They saw a train winding its way slowly through the narrow defiles of the mountains. One of the company suggested that they roll a boulder down upon the track and wreck the train. Smuts forbade it. "We shall not add murder to defeat." On that train was the then Lieutenant, and now Lord, French.

To be sure, mercy may not always come so graciously and dramatically as this, but it is never really lost.

Life asks us to treat it generously, to sow with a broad sweep, not to hold back. It redeems every good deed and generous thought, somewhere and somehow. It asks us to cast our bread upon the waters. Though the interval may be long and though the effort may be apparently unfruitful, it holds out the comforting promise that we shall find it after many days.

Uncle Ab says a squeaky windmill never cured insomnia or gained any popularity with the neighbors.

Milk Bottle Recoveries

In the year 1923 the milk dealers' bottle exchange collected, sorted, and returned 33,622,267 bottles to 437 patrons. This concern is owned and operated by and for the Milk Dealers of Chicago and its suburbs. It is their authorized agent in the matter of collecting, sorting, and returning to them their bottles, cans, and cases. It spends approximately $20,000 per annum in recovering bottles from persons who have illegal possession of them and in discouraging them further in this undesirable practice. This money is spent chiefly in bringing suits of replevin and injunction proceedings. A system of inspection is maintained, three men with automobiles being employed for this purpose.—E. REUTER, MGR.

ALFALFA ENTHUSIASTS AT A PICNIC HELD JUNE 20TH ON THE FARM OF W. W. BROOKS, TODD COUNTY, MINNESOTA

This was just a community gathering called for the purpose of discussing among themselves the best time to cut alfalfa and the best way to cure it. Mr. Brooks has 55 acres of alfalfa most of which is several years old.

Camps for Farm Women

The person in West Virginia—whoever it was—who thought of the camp for farm women certainly had a good idea. There may be others like it but I have not heard of them.

Back there to a beauty spot called Jackson's Mill they go every summer and leave behind them every trace of home duties. No, not quite; they do have to make their own beds but they don't do a scrap of cooking or dishwashing all day long. Imagine the relief.

They stay five days and pay a dollar a day plus another dollar for registration and when they leave to go back home they feel as frisky as spring lambs. The campers—there will be about 150 this year—are divided into tribes and they have as much rivalry as if they were Indians; yelling, playing games (they even play baseball and pitch horseshoes), doing stunts, and renewing their youth in general.

These grown-up girls may study if they want to and this year they are being offered a course in fairs and exhibits with Appreciation of the Beautiful as a secondary theme. The director reports that the campers are wonderful women in their enthusiasm for things and their appreciation of Nature, good pictures, and music.

The thing they like best of all is vespers and this service is held out on the grass. They never stay indoors any longer than they must nor in bed, either; the only difference the rising bell makes is that they begin talking out loud instead of in whispers for in order not to miss anything they get up at 5:30 instead of seven as they should.

It may sound queer but no children are allowed in camp. It makes a good many tugs at the heart but if they were along there would be no rest for the mothers and as the separation is so short it works out best for both.

At home they simply have to be serious most of the time—we think we do at least—but in camp these women are up to all sorts of pranks and tricks on each other. The fat ones stage a show for the lean ones by doing reducing exercises, in fact the director had to get up once in the middle of the night and attend to them because of the noise they were making. There they were out on the grass in the moonlight almost in convulsions over a huge, good-natured woman who was going through her exercises for the benefit of the crowd.

It made them think of school days when the camp director had to come and shoo them back to bed. They said they could sleep at home and didn't believe in wasting time doing it in camp any more than was necessary.

Men and women come from long distances to address them. These people are chosen for inspirational ability and their speeches give the campers something worth thinking over as they go about their farm work. Law making and their part in it is explained in such a way as to make them feel it is as much their concern as anyone's what sort of public officials we elect.

Of course they have a chance to learn all sorts of good things about making their houses more attractive and it is all presented in such a way as to want to make them want to go home and do something about it; that is the only kind of teaching that is worth anything. I wish we all had a chance to go to such a camp and until we do, success and happiness to our West Virginia women.—LUCY THOMPSON.

Dressing for the Salad

Nearly all vegetables may be served in the form of salads. The salads made with raw vegetables are more refreshing and, I think, more generally relished than are those made with cooked vegetables.

The most common of the green salad plants are lettuce, celery, dandelion, tomatoes, endive, chickory, and water cress. Other vegetables should be used for salads because they give a very pleasant variety to the menu. Raw cabbage, green cucumbers, young carrots (put through the food chopper) cooked beets, cooked spinach, peas, and cooked potatoes all make most excellent salads either alone or in combination.

When salads are used every day it becomes necessary to have on hand some dressing or sauce that will season or "dress" the vegetable. Salad dressings are usually sharp or pungent sauces and are suitable for every kind of vegetable raw or cooked. The dressings can be prepared at any time, and when they are made in quantities large enough to last a week or more, it is an easy matter to concoct a salad at meal time.

Because I have salads every day, I keep on hand three kinds of dressings which I use as bases for all the dressings I make. They are the ordinary French dressing, a boiled dressing, and the regular mayonnaise. When I am having a hearty meal I plan to have a light salad such as some salad green or an acid fruit with French dressing. For a light meal I choose a hearty salad with cooked or mayonnaise dressing. Such salads of vegetables, eggs, fish, meat, or cheese I often use as the main dish at a meal. A fruit salad with a sweet dressing often forms the dessert.

French Dressing and Variations

Oil, 1 cup	Powdered sugar, 1 teaspoon
Vinegar, ¼ cup	A dash of red pepper
Salt, 1½ teaspoon	Paprika, ½ teaspoon

These are the proportions I always use but I make it in larger quantities, never less than a pint at a time. To make it I first put the dry ingredients in a bottle or a glass fruit jar, next add the vinegar, and then the oil. Then I cork the bottle or seal the jar and shake the dressing vigorously until it is good and thick. Then I pour off as much as I want for the present meal, recork the bottle, and set it away in a cold place. The bottle must be shaken well each time before the dressing is used.

With this dressing as a base I can use different flavorings which makes every dish seem new. For meat or fish I add a teaspoon of mustard, or a tablespoon of India relish. For green salads I add 1 teaspoon each of finely chopped parsley and capers and one teaspoon of grated onion. Sometimes I just add more salt, pepper, and tobasco sauce. The yolk of a hard cooked egg may be added or some finely chopped sweet red and green peppers. To ¼ of a cup of French dressing I sometimes add a tablespoon of finely crumbled cheese. For fruit salads I add a little orange or grapefruit juice.

Quick Mayonnaise Dressing

Powdered sugar, 1 tsp.	Oil, 1 cup
Mustard, 1 teaspoon	Egg, 1
Few grains cayenne	Vinegar, 2 tablespoons
Onion juice, few drops	Salt, 1 teaspoon

All the seasonings I put into a large-top fruit jar, mix them well, and then add the vinegar. When the vinegar is well mixed with the seasoning, the egg is added and well beaten. Now the oil is added, at first a tablespoon at a time, and when it is well mixed with the egg, the oil is added in larger quantities. When I have sour cream or slightly sour cream, I add it instead of a part of the oil.

Mayonnaise dressing I vary the same as the French dressing. I take from the jar as much as is needed for the present meal and make my additions to suit the particular dish I am making. When I have fish, meat, or shell fish I add to a cupful of this dressing about two tablespoons of chopped olives and sweet pickles. Sometimes I add some finely chopped onion. But for fruit salads I usually add more sugar and beat the dressing up with some whipped cream.

Easy Boiled Dressing

Melted butter, 3 tbsp.	Milk, 1½ cups
Flour, 1½ tablespoons	Eggs, 2
Salt, 2 teaspoons	Sugar, 4 tablespoons
Cayenne pepper	Mustard 3 teaspoons
Vinegar, ½ cup	

First I mix all the dry ingredients and mix them with about ¼ of the milk until they are well blended. Then I heat the remainder of the milk, add the melted butter, thicken it with the first mixture and let it boil for about two minutes. After it has cooled slightly I add the vinegar, and pour this hot liquid carefully over the slightly beaten eggs, stirring constantly. The whole I then cook in a double boiler until it thickens. This rule makes more than a pint of mild dressing and will keep for a long time if it is kept in a cool place.

Salad dressings and oils should be kept in a dark, cool place to keep them from becoming rancid. The colder they are, the thicker they will be and the thicker the dressing will be.

When tender green salads are made the dressing should not be put on until it is time to serve the dish because the vinegar draws out the water and wilts the salad plants. Meats and cooked vegetables, how-

Fashion Magazine

From the front cover of our Spring and Summer Fashion Magazine right on through the book, you will see all of the styles which will be popular during the coming season. Styles for morning and afternoon wear as well as those needed for the more formal occasions. And cute styles for the kiddies. There are dressmaking lessons for the beginner, and charming styles which can be made in a couple of hours even by one who is a novice with the needle. Also photos of the most popular Broadway, New York, actresses. So settle your dress problems by sending 10c today for our new Fashion Magazine. You'll save dollars by doing so. Address Fashion Department, Hoard's Dairyman, Fort Atkinson.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Miscellaneous Fashions

No. 2050—Easily Made Style. Truly charming and simple too, recommends this style to the fastidious woman who has little sewing experience. The design is so simple, in fact, that you could finish it in a few hours. A printed silk crepe, canton crepe, crepe satin, or plain or fancy cotton material is suitable. Cut in sizes 16 years, 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 requires 3¼ yards of 40-inch material with ⅞ yard 36-inch contrasting.

No. 2119—The Older Woman will find the lines of this smart style very becoming. A gray voile with blue motif running through it to stimulate a braiding design would be attractive. Silk crepes and plain and fancy cottons might also be used. Cut in sizes 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 requires 4⅝ yards of 40-inch material with 1⅛ yards of 36-inch contrasting and 4½ yards of edging.

No. 2057—Charming Design for Girls. It cuts all in one piece. Cut in sizes 6, 8, 10, 12, and 14 years. Size 8 takes 1¾ yards of 36-inch material with 2½ yards of binding.

No. 2062—Slenderizing Corset Cover. Cut in sizes 36, 38, 40, 42, 44, 46, 48, and 50 inches bust measure. Size 36 requires 1 yard of 30-inch material with 2¾ yards of edging.

No. 1983—This good-looking style cuts all in one piece as shown in the accompanying diagram enabling even the amateur home sewer to cut and finish it in an hour. The pattern comes in sizes 16 years, 36, 38, 40, and 42 inches bust measure. Size 36 requires 3¾ yards of 40-inch material with 2⅛ yards of 5-inch ribbon.

No. 2081—Men's and Boy's Union Suit, buttoned at front and across the right center-back and side of drawers section. Cut in sizes 6, 8, 10, 12, and 14 years, 34, 36, 38, 40, 42, 44, and 46 inches breast measure. Size 36 requires 2 yards of 36-inch material.

No. 1893—Costume Slip, to be made with straight upper edge and shoulder straps or with built-up shoulders and round neck. Cut in sizes 16 years, 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 requires 2⅞ yards of 36-inch material.

ever, are greatly improved by being tossed around in French dressing and allowed to stand for a while to season, even when they are to be served with some other kind of dressing. This process of seasoning is called "marinating" and it is a real economy because less dressing is needed to give the desired flavoring.

Mayonnaise dressing should not be put on the salad until it is just time for serving. It is likely to separate if it stands around in the kitchen for a while. For this reason it is great economy to serve the salad without dressing and to simply pass the dressing at the table in a mayonnaise bowl.

I always make the dressing in large quantities. A quart is as quickly made as a much smaller quantity and it may be kept for several weeks if kept in a cool place.—SOPHIA K. ORMOND.

Sweet Pickled Peaches

Clings are fine for this but we all know the difficulty of trying to eat them nicely. A man we know was invited out one time where they had these and in trying to get a nibble off one he managed to throw it into his lap. Of course he was confused and embarrassed for a minute and then, seeing that no one seemed to have noticed it, he wrapped the peach in his napkin and went on eating. Of course he was gone by the time the hostess found out that one of her best napkins had been nearly ruined by being wrapped for several hours around a pickled peach. But clings do have the best flavor, just the same. Here is the recipe:

½ peck peaches
2 pounds brown sugar
1 pint vinegar
A few cloves
1 oz. stick cinnamon

Boil sugar, vinegar, and cinnamon twenty minutes. Dip peaches quickly into hot water and rub off fur with a cloth. Stick each peach with a few cloves. put into syrup and cook till soft, taking only a few peaches at a time. Pack in jars and fill to overflowing with syrup.—LUCY THOMPSON.

A Potpourri

It's a grand-sounding French name to spring on your friends (pronounced po-poo-re). While it has one or two other meanings we Americans usually use it to mean a collection of dried flower petals used to scent a room.

They are as easy as can be to make if your garden has roses or other fragrant flowers in it. After the dew is off, pull the petals from roses and place them in layers in a jar alternating with thin layers of salt. If you are growing lavender this summer you can add some of these flowers, too.

Keep adding to the jar from day to day as the flowers bloom and when it is full sprinkle in some powdered cloves, cinnamon, and nutmeg. Keep the jar closely covered until you wish to perfume a room.

Either a covered pottery or glass jar that is ornamental is appropriate and if you have a bedroom with sprigged wall paper and old fashioned furniture in it, your potpourri will add the last touch.—LUCY THOMPSON.

His Oath!

"Do you know the nature of an oath, madam?"

"Well, I ought to, sir. We have just moved, and my husband put down the carpet."—Everybody's Magazine.

Friendly Talks for Farm Folks

Clark Figary says that most everybody thinks the grass a little greener on the other side of the fence or world, but when a man sells out and moves over, he's pretty likely to discover it was nothing but quack grass all the time.

⚜

A white-collar man from the city had gone back to the farm and was laboring by the hard sweat of his brow to reap a living from the stony and worn-out land in which he had invested. A lady of romantic inclinations from his farmer abode was visiting the family, and she would watch the perspiring one with vast interest as he daily attempted to wring a few crops from his reluctant acres. "What fun it must be to work with Nature in the great outdoors!" she enthused. "Huh!" finally replied the would-be farmer in disgust, "I'll say there couldn't be anything much funnier!"

⚜

At a farm auction the other day, two neighbors a little short of cash hatched a scheme between them to buy an outfit of hay tools together, taking turns using them. "It's like this," one of the intending purchasers explained to a skeptical listener. "When I want the hay loader and rake Mort will be all through with 'em as he's so durned forehanded that he gets his haying all done for the day in the forenoon; while some way or other I never get around to haying in earnest 'til afternoon when Mort's all through." Perhaps this partnership will work out better than folks think.

⚜

Caleb Russell's boy, George, has always worked out like his fathers before him, and now at the age of twenty-eight has bought himself a dandy little farm and begun stocking it and expects to wed the prettiest girl in the county next month. For a hundred years back the Russells have been known as the finest helpers to be had hereabouts, and any farmer who had the luck to hire one of them for a year's work has rightfully considered himself and land lucky. About all the Russell boys down the years have worked out so long, carefully saved their money, bought a good farm eventually, and have become leading and prosperous citizens in good time. George, Caleb's son, has only followed in his father's and grandfather's footsteps in this regard and would be greatly surprised if he were patted on the back for his industry and thrift. It would never have occurred to a Russell, either of yesterday or today, to leave the land in the lurch—whether it was their own land or somebody's else—to go to the city for a job or tear off to see the world or do any of the things the average man or boy has and will do before he settles down for good. The Russells are country people, born and bred of the soil just as much as the towering trees and the green grass which grow around them. Boys of this generation either go to college or clerk in a store or become drummers or do just about anything except stay on the farm for the sheer love and loyalty of it. The Russells are a fast disappearing clan. When they are no more, something clean and sweet and worth-while like good broken dirt itself will have disappeared forever. But who shall say that the Russells are the salt of the earth? Aren't such as these missing the best, after all, that life has to offer?

New York. HELEN S. K. WILLCOX.

Discovering ways of making electricity of greater service everywhere—on the farms as well as in the cities—is the chief work of the scientists and engineers of the General Electric Company.

Electricity for the farm

ELECTRICITY began work in the cities where the demand for better light and more convenient power opened large opportunities for this giant energy.

Now agriculture, the nation's greatest industry, asks for the help of electricity to lift its burdens and make life richer.

The many uses for electricity in agriculture are described in "The G-E Farm Book," which you may obtain free of cost by writing to Section E, Publicity Department, General Electric Company, Schenectady, N. Y., Chicago, Ill., or San Francisco, Cal.

GENERAL ELECTRIC

KEEP COOL!
LET THE FARM PUMP ENGINE PUMP YOUR WATER

When it's "hotter than blazes," not a breath of air stirring, creeks and ponds bone dry, cattle are thirsty, and *your water tank is empty*—what then? Just attach a Fuller & Johnson Farm Pump Engine to your pump and you've got a flowing well—a gusher! A supply of cool, fresh water worth hundreds, perhaps thousands of dollars to you.

A simple, compact, practical pumping outfit. Comes complete. Fits any pump. Mounts on any well platform. No belts to get out of order. Easy to start. Air cooled; can't freeze; won't overheat. Convenient pulley for operating other hand power machines. Many in use fifteen years.

Write today for *free* booklet 17A. Learn more about this wonderful pumper.

It costs you less to use the best

Cheese Markets

(Report by U. S. Dept. of Agr.)

Cheese markets were firmer following previous weeks' price declines. Trading was more active but buyers were cautious and discouraging any advance. Production was heavy except in parts of New York State where backwardness of the season is still evident to some degree. Active buying for storage.

The average wholesale prices on American cheese, style Twins, for the week ending July 12, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending July 12 1924	July 5 1924	July 12 1923
	Cts.	Cts.	Cts.
New York	20.7	20.6	24.7
Chicago	17.9	18.7	21.8
Boston	21.6	21.4	24.9
San Francisco	21.1	19.5	23.3
Wisconsin Board	17.4	18.3	21.4

The receipts of cheese at these markets were 6,339,925 lbs. for the week as compared with 5,799,247 lbs. last week and 6,050,255 lbs. a year ago.

MILWAUKEE, July 22—Butter—Creamery, extras, tubs, 37c; standards, 36½c; extra firsts, tubs, 35@36c; firsts, 33@34c; seconds, 30@32c.

Eggs—Fresh gathered firsts (new cases), including cases, candled, 25@25½c; ordinary, firsts (standard cases), 24½@25c; miscellaneous lots, shippers' cases returned, candled, 21@22c; seconds, dirties, 19½@20c; checks, 19½@20c.

Cheese—American full cream, Twins, 17½@18c; Young Americas, 18@18½c; Longhorns, 18½@19c; Daisies, single, 18@18½c; American, 32c; Pimento, 34c; Swiss, 42c; special market Brick, fancy, 15½@16c; Limburger, new, 22@23c; imported, Swiss loaf, 44@48c.

CHICAGO, July 21—Butter—Receipts, 17,796 pkgs.; creamery, extras, 37c; standards, 37¼c; dairy, firsts, 35@35½c; seconds, 33@34c.

Eggs—Receipts, 19,510 cases; ordinary, 24@24½c; firsts, 25@26c.

Cheese—Twins, 17½@18c; Young Americas, 19c.

FOND DU LAC, Wis., July 19—Average cheese prices (majority of sales), f. o. b. shipping point: Flats, 17¾c; Twins, 17½c; single Daisies, 18c; double Daisies, 17¾c; Longhorns, 18c; square prints, 18¾c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange July 19: Single Daisies, 16¾c. On Farmers' Call Board, July 19: Twins, 16½c; single Daisies, 16¾c; Young Americas, 17¼c; Longhorns, 17c; square prints, 17½c.

NEW YORK, July 21—Butter easier; receipts, 9,583 tubs; fresh supply, 64,121 tubs; creamery extras, 40½c; specials, 40¾@41½c.

Eggs—Firm; receipts, 5,091 cases; fresh supply, 68,643 cases; white, fancy, 41@44c; fresh firsts, 27@33c; western whites, 28@40c.

Cheese Prices for June

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices for American cheese (style Twins) for the three large markets in June:

	Average price 1924	1923
	cents	cents
Wisconsin Boards	18.4	22.9
Chicago	18.7	23.3
New York		24.3

Longhorns averaged 18.8 cents in June on the Wisconsin Boards as compared with 18 cents in May and 23.4 cents a year ago. The receipts of cheese at Chicago, New York, Boston, and Philadelphia totaled 98,087,696 lbs. for the first six months of the year as compared with 98,124,177 lbs. for the same period last year. Storage holdings at these markets on July 1 were 15,101,652 lbs. as compared with 13,351,210 lbs. a year ago.

Cold Storage Holdings

(U. S. Department of Agriculture)

The following is a report of the cold storage holdings of dairy products on July 1, figures being given in thousands of pounds (000 omitted):

	July 1 5-yr.-ave.	July 1 1923	July 1 1924
Butter, Creamery	66,971	62,768	74,446
Cheese, American	34,413	36,834	45,517
Cheese, Swiss	1,660	2,089	5,675
Cheese, Brick	1,722	2,511	2,138
Cheese, Limburger	679	809	751
Cheese, All Other	6,685	6,485	7,943

These holdings include stocks in both cold storage warehouses and packing house plants.

Butter Markets

(Report by U. S. Dept. of Agr.)

Butter markets declined slightly during the week ending July 12. Receipts were heavy and somewhat in excess of immediate demand despite an active into storage movement. Production was favored by good pastures in principal dairy sections. Imports were light.

The average wholesale prices on 92-score butter for the week ending July 12, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending July 12 1924	July 5 1924	July 12 1923
	Cts.	Cts.	Cts.
New York	41.0	41.2	38.8
Chicago	39.0	38.7	37.9
Philadelphia	41.6	41.5	39.6
Boston	41.4	41.2	39.1
San Francisco	39.1	38.5	41.7

The receipts of butter at these markets were 23,749,345 lbs. for the week as compared with 19,647,153 lbs. for last week and 19,037,702 lbs. a year ago.

Wisconsin Dairy Cattle Prices

(Wisconsin College of Agriculture)

Shipments of dairy cattle outside the state totaled 22,165 for the first six months of the year as compared with 22,480 for the first six months of the previous year.

Several complete and many partial dispersion sales have taken place during the months just passed. Some rather sensational averages were evident in at least two big sales. The National Guernsey Sale averaged $1,134. Several of the top priced animals originated in Wisconsin herds. The John Erickson & Sons sale of Holsteins set a precedent for Holsteins the world over, with an average of $1,138.

Canada and Mexico are again buying dairy cattle, having taken several carloads during the winter. It is presumed also that much stock will be purchased by California to replace animals slaughtered during the foot-and-mouth disease outbreak.

Plans are well under way for a big sale of 300 head of grade cows during the National Dairy Show, Sept. 27—Oct. 4. This sale will contain only carefully selected and inspected dairy stock, all of which will have cow testing association records. Many of the animals offered for sale will be shown in the special classes where awards will be made for type and production.

The following table shows prices generally prevailing on grade cows during June:

Extra choice springing cows of good size and type, with C. T. A. records of 300—400 lbs. fat	$125—150
Choice springing cows without records	110—130
Good cows, springers	80—110
Cows, milkers	60— 85
Ordinary cows, fresh last spring	40— 70
Cows slightly blemished	30— 50
Cows, "culls"	25— 40
Choice heifers, 2-yr-olds, springing, record dams	70— 90
Heifers, 2-yr.-olds, Springing	50— 75
Heifers 1—2 years old, open or recently bred	35— 50
Heifers, undersized and thin	20— 35
Heifers, yearlings	25— 40
Heifer calves born last fall	20— 35
Heifer calves 2—6 wks. old (crated)	15— 30

June Prices at Wisconsin Condenseries

(Wisconsin Department of Markets)

The following table gives the prices paid for milk delivered at Wisconsin condenseries during the month of June or, if not available, prices for the previous month are given as noted by a star:

City	Prices to producers per 100 lbs.	Test of basis of payment	Price paid for 3.5% milk
		%	
Berlin	$1.75	4.0	$1.53
Black Creek	1.80	4.0	1.57½
Bloomer	1.75	4.0	1.53
Brooklyn	2.30	3.5	2.30
Burlington (Nestle)	1.80	4.0	1.60
Chilton	1.75	4.0	1.53
Clinton	2.30	3.5	2.30
Columbus	1.75	3.5	1.75
Darien	2.00	4.0	1.75
Delavan	1.80	4.0	1.60
East Troy	1.60	3.5	1.60
Genoa City	2.30	3.5	2.30
Elkhorn	1.65	3.5	1.65
Footville	1.50	3.5	1.50
Fox Lake	1.60	3.5	1.60
Greenville	1.80	4.0	1.57½
Hillsboro	1.50	3.6	1.46
Jefferson (L. M.)	1.50	3.5	1.50
Jefferson (Car. M.)	1.60	3.5	1.60

Marshall	1.75	3.5	1.75
Mayville	1.88	4.0	1.64½
Merton	1.60	3.5	1.60
Monroe	1.80	4.0	1.57½
Monticello	1.80	4.0	1.57½
Neillsville	1.74	4.0	1.52½
New Glarus	1.55	3.5	1.55
New London	1.80	4.0	1.57½
North Prairie	1.60	3.5	1.60
Oconomowoc	1.60	3.5	1.60
Orfordville	1.80	4.0	1.57½
Osseo	1.80	4.0	1.57½
Richland Center	1.75	4.0	1.53
Sawyer	1.55	3.5	1.55
Sharon	2.00	4.0	1.75
Sullivan	1.60	3.5	1.60
Walworth	1.80	3.5	1.80
Watertown	1.60	3.5	1.60
Waukesha	1.70	3.5	1.70
Waupun	1.60	3.5	1.60
West Bend	1.88	4.0	1.64½
Weyauwega	1.70	4.0	1.47½
*Albany	1.65	3.5	1.65
*Belleville	1.65	3.5	1.65
*Denmark	1.65	3.6	1.61
*Fond du Lac	1.69	3.6	1.64½
*Green Bay	1.55	3.5	1.55
*Lodi	1.96	4.0	1.76½
*Menomonie	1.96	4.0	1.76½
*Milwaukee	2.22	3.5	2.22
*Oostburg	1.65	3.6	1.61
*Racine	2.57	3.5	2.57
*Reedsburg	1.96	4.0	1.76½
*S. Germantown	1.75	3.5	1.75
*Sparta	2.00	4.0	1.75
*Stoughton	1.90	4.0	1.66
*Valders	1.88	4.0	1.64½

*Denotes prices paid for May.

Some of the plants on the above list are not strictly condenseries as they make a practice of bottling part or nearly all of their milk and their prices usually run higher than those paid by straight condenseries.

Visitor (at private hospital)—Can I see Lieutenant Barker, please?

Matron—We do not allow ordinary visiting. May I ask if you're a relative?

Visitor (boldly)—Oh, yes! I'm his sister.

Matron—Well, well I'm very glad to meet you. I'm his mother.—Rotary Round Table.

Carload Prices of Hay, Straw, and Feed, July 12, 1924

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Hall Comes Back

HOARD'S DAIRYMAN:—I have just read Mr. Bosses's reply to my letter and wish to say in reply that I think he has taken a wrong slant at some portions of my article.

I agree with him that a person ought to save money on $8 to $10 per day provided this income is assured every working day in the year.

There are none of these high wage positions that will cover 310 working days unless a man is one of the higher ups in a corporation.

There are a good many people—I will admit—who live beyond their means but you can generally find the sequel in the "for sale ads" of a daily newspaper.

As Mr. Bosse states, I saved money; but to do so I sacrificed much that goes to make for pleasant living.

We bought a quart of milk daily and from this the good wife churned the cream with a spoon to make part of the butter we used on the table. I wonder if his family ever scrimped that close. As for shows, if we saw a two-bit movie once a week, on Sunday, we felt well satisfied.

Increasing consumers and decreasing production will not solve our problems. There is only one way to reach success in this matter and that is a unified movement of the farmers for co-operation. When they get as good a co-operating system as have the dealers we will get what we should have—a profitable price and a ready market for all we have to sell. When the farmers of America get together in one big organization with money enough to take care of those who are obliged to sell—then and then only will we reach the solution of our troubles.

Oregon. H. HALL.

In the Same Boat

HOARD'S DAIRYMAN:—Hurrah for Ed. Jones! Jones, I am in the same boat you are in but almost out of gas. I, too, am in a "gym" most all the time. I am milking 15 cows, retailing milk, and doing all my barn and milk house work. A dairyman and a farmer don't need "gyms". Get up at 3, hit the ball until 7 at night, and some one will hunt a bed, not a "gym".

What does E. C. Ward want with more immigrants? Our need is less immigrants and more 100% Americans on our farms. Renters and help are plentiful if things are so a tenant could live and rent not so high.

Illinois. O. R. WILBURN.

Plan to Lessen Crop Production

HOARD'S DAIRYMAN:—Apropos of present overproduction of farm crops, and incidental low prices and apropos also of depleted condition of many soils, I would suggest that the pending efforts to increase co-operation among farmers be directed also to the following:

Let it become "fashionable" throughout the land to withdraw from crop production for each of the next, say, seven years, one-seventh (a different one-seventh each year) of the tillable area of each farm, by devoting such one-seventh to an intelligent system or plan of soil restoration.

The agricultural press, aided by the Department of Agriculture, the agricultural colleges, and the farm bureau, can develop the necessary sentiment if the plan is deemed to meet the situation.

Maybe the "farm bloc" will see a way to help along, if action by Congress could assist in making the plan popular, or as already stated, "fashionable".

Chicago. J. H. V.

Farmers Over-organized

HOARD'S DAIRYMAN:—Your editorial in the April 25th issue, entitled "Does Wisconsin Need Help", is certainly timely and a well written editorial, and it behooves Wisconsin dairymen to heed the last paragraph —"Prove all things; hold fast that which is good".

It seems to an outsider that there ought to be enough talent and good leaders among Wisconsin dairymen, with the help of their State Marketing Department, to derive ways and means without having to call on Mr. Sapiro and his cohorts who, according to "The Dearborn Independent" are not going around the country organizing the farmers merely for their (Sapiro, et al) health. (See page five in April 12, 1924, issue of D. I. where it states they took $51,000 in fees from one regional association in one year. Good night! No wonder farmers are kept poor when such leaders are hung onto their associations.) On same page mention is made of fat advertising contracts, which reminds one of an ad one of the California Fruit Growers' Associations had in the February, 1922, issue of the Ladies' Home Journal, in which they stated right on that page, showing a copy of the check of $11,000 used for paying for that one ad. Good night, again. They surely must have had to make *some sales* to remburse them for that amount of money for that one ad.

This pooling business may work out all right with milk and cream, but somehow it does not seem to work out properly with us here in the fruit line. The best seem to suffer at the expense of the poor stuff that slips in and seems impossible to keep out.

In this neighborhood the largest growers and those that have the money simply won't come into our co-operative association at all, leaving the small growers (about 50 of them) to hold the bag, and it is certainly some proposition, and it's a question of how long they will or can hold together. As far as our own experience goes, we have lost money each of the past three years now by putting our fruit through the local association.

Seems to me farmers are being *over*-organized; too many wheels within wheels. Personally I would not sign a five-year contract with any co-operative for any commodity.

Michigan. FRUIT GROWER.

City vs. Farm Life

HOARD'S DAIRYMAN:—To Mr. H. Hall of Oregon who doesn't like city life on a salary of $8 or $10 a day nor house rent at $25 to $100 a month, I will suggest that he is in all probability getting his money's worth in house rent even though his wife elects to live in a $100 a month house, as we find it difficult to get 7 per cent net on our own investment in city property.

If he has been able to save nothing from his salary and has to borrow money for a farm and farming equipment, his taste, nor that of his wide, need not run very wild to be required to pay $100 a month interest.

Of course living expenses are somewhat less on the farm than in the city but our records show that four-fifths of our expenses are operating expenses and everybody on the place has to "hop to it" to get that free milk and meat truck together to keep the living expenses down to the remaining one-fifth.

If a city man decides $100 a month is too much rent he can move to a cheaper house without lowering his income, whereas if a farmer learns his expenses are too high his only solution is to sell off some and in so doing he lowers his income and is not benefited.

Mrs. City Wife complains about the price of market vegetables, etc., and does not realize that the peas were the farmer's first picking and the potatoes his best, for many times do farmers find it necessary to part with the first fruits of their land for money to keep their operating expenses on a cash basis.

It is a joke to a farmer, paying as we have done $3 an acre for 50 acres of timber on a rented farm, good for nothing to us but fire wood; $150 a year cash for "free fuel", and then have to cut and haul it.

It is a delicious experience for the farmer to keep out all the milk his family needs but when he sets several cans of the same milk on the milk stand at 12c a gallon and remembers his investment in cows and land and labor, he wonders if his own milk was free. His meat is gained by the same rule, investment of capital, and rentless labor and is not free.

How the city man hates the water and light bill! But how glad would the farmer be to have a water and light system without planking down the entire cost of an individual system and installation!

Many times the farmer hungers for nicer clothes. But the year comes when the crop fails and he goes to friend banker to borrow his interest or taxes or both. Surely no city dweller wants the experience.

Illinois. (MRS.) SAM ALEXANDER.

Unearned Increment A Mental Illusion

HOARD'S DAIRYMAN:—I note in the O. B. and B. column of your issue of May 23 that Mr. McKnight still refuses to argue a point which I have now made 3 or 4 times, viz., that, not alone rental value, but all values are created by economic demand. Such refusal on his part would seem to indicate that he has the best of reasons for it—in other words, he finds such argument hard sledding.

That there is an apparent unearned increment of land values in centers of population will not be denied. While even our single tax friends would not contend that government or society has earned this increase any more than, according to their way of thinking, the holder of the title has earned it, still there would seem to be some slight justification for governments taking the increase for taxes on the theory that nobody has earned it and that "finding is keeping".

The situation reminds us of the experiment in optics which we learned when we were school-boys. You make a drawing of a bird cage. Two or three inches to the right of the cage you draw a bird—not too life-like, but something that will represent a bird. Now hold your drawing directly in front, and within about 2 inches, of your eyes and look at it intently for a few seconds. The bird will go into the cage.

You see the bird go into the cage just as plainly as you ever saw a bird in nature flit from branch to branch of a tree and yet you know that the bird in your drawing does not move. The phenomenon is an optical illusion. In like manner the "unearned increment" of land values of the single taxer is a mental illusion, due to superficial thinking, and reflects no credit on the acumen of our erudite single tax friends who would have us believe that they take "digging deep into the soil of economic knowledge" along with their daily dozen.

Mr. McKnight says that the "mere presence" of people gives value to the land. That this is a fallacy shall now be set forth.

Thirty-four centuries ago, or thereabouts, in a desert between Egypt and the land then known as Canaan, but latterly as Palestine, there was present an Israelitish horde, variously estimated from 600,000 to 2,000,000, fleeing from Egyptian bondage. Their presence there did not add anything to the rent-value of the locality. The desert was already nearly worthless but became more so until the Lord Almighty had to feed His people with "bread from heaven" and water them from the smitten rock.

There are today 2,000,000 Israelites on Manhattan Island and its environs, known as greater New York. Their "mere presence" adds no more to the real estate values of New York City than did the presence of those other Israelites add to the value of the desert of Arabia Petraea. Their presence as producing, but more particularly as consuming, units is what raises the price of "market stalls" in New York. In other words, it is not the presence of population that makes land valuable, but rather the agricultural or mineral resources, adjacent fisheries, or the strategic position of a locality that makes a large population possible.

Moreover, the so-called "unearned increment" is not unearned. It is as rightfully earned as any return on capital is ever earned. There would never have been a dollar of capital in the world had there not been the reasonable expectation of a return on money invested. Without capital there could have been no civilization and we would still be cave-men.

Someone fond of figures has computed that if the $24 paid to the Indians for Manhattan Island about 300 years ago had at that time been put at compound interest, it would by now have amounted to a sum practically equal to the entire valuation of said island, minus improvements. What becomes of your unearned increment? Million dollar building lots in New York or Philadelphia have passed through the hands of a great many owners. Some have made a profit on their investment; others have suffered loss. If government is not to reimburse those who have lost, why should it appropriate the profits of those who have made good?

The mental-optical illusion of the single taxer is due to the fact that the imagination leaps back to the time when the fruitful valley or the populous city was a howling wilderness. He sees it as it is today and jumps to the conclusion that all this value just "happened" while the owner slept and that therefore the latter could not possibly have earned it. This specious fallacy will be readily corrected by a little straight thinking.

Yes, the farmers pay too high taxes today. A. N. PETERSON.

New York.

Man's greatest inspiration is service. "He who is the greatest amongst us, let him be the servant of all."—RT. HON. RAMSAY MACDONALD.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Fitting the Dairy Calf for the Show Ring

1—The first operation is to wash your calf in a good suds. This you can do a week before fair time. Of course, it is taken for granted that you have had your calf blanketed for some time before this, several weeks at least. Blanketing keeps the calf clean, keeps the flies off, sweats and loosens the hide, and makes the hair lie smoothly. In washing, don't be afraid to use a lot of elbow grease.

2—It is quite important that you give the switch a thorough washing. If the switch is white you can rinse it out in a little blueing water. Oftentimes, the night before showing, it is a good plan to braid the switch and tie it up to keep it clean. Unbraiding just before entering the show ring and combing makes the switch curly and fluffy.

3—After the calf has had its bath be sure to blanket it so that it won't catch cold. In putting on the blanket begin at the neck and roll it back in the manner shown above. This makes the hair lie smoothly and in the proper direction.

4—Trimming the hoofs is the next operation. Lift the fore leg with the left hand, holding between the legs as shown here. With the knife firmly grasped in the right hand, clean out the under parts of the hoof and trim the toenails. This may be done before leaving home for the fair.

5—If your calf has horns they will need attention. They can be polished so they fairly shine. The first step is to scrape off the surface of the horns either with a rasp, as shown here, or with a small piece of glass. Be careful not to rasp too deeply; if you do, you will draw blood.

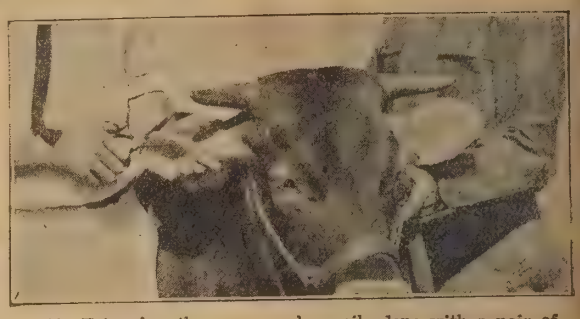
6—Follow the rasping with a thorough emery paper rub. Taking a short strip of emery paper in your hands rub around the horn as above.

7—To finish off the polishing rub vigorously with a flannel cloth dampened with a little sweet oil. This operation is just like polishing shoes.

Fitting a dairy calf for the show ring is no over night job. It takes months to get a calf in shape to win in the show ring as Dorothy Domke said in her article "Showing a Calf to Win". If you haven't begun to get your calf ready for the fair yet, you'll have to get a hustle on you.

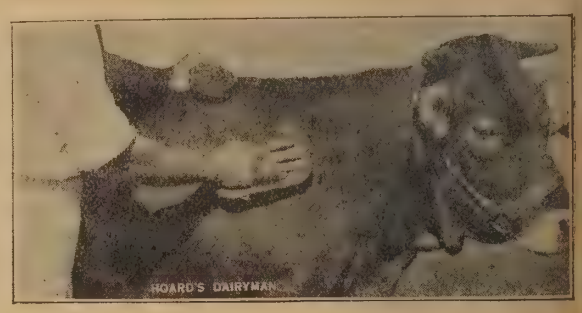
For one thing the calf must lead well. Perhaps you have found out already that this alone takes considerable time. A calf must be taught to stand so that she will show off to the best advantage. A calf must be fed and taken care of right, so that she will be in good flesh and good health when fair time comes.

The illustrations on this page show you how to "dress up" your calf so she will appear at her best when shown. These pictures were posed especially for the junior department of Hoard's Dairyman by two well known showmen, Ray Klussendorf and his helper, Verlyn Sears. Mr. Klussendorf fitted and showed the grand champion Brown Swiss bull at the 1923 National Dairy Show. We hope that you junior showmen will get much help from this material.



There are a few very useful articles that every showman ought to have. An outfit would include: a bar of soap, a pail, a scrub brush, a blanket, a sharp knife, a rasp (or a piece of glass will do), some emery paper, flannel cloths, sweet oil, pomace stone, clippers, a pair of shears, curry comb, and brush.

8—It is sometimes well to clip your calf all over a week or so before the fair, particularly if its coat looks a little shaggy. At any rate before entering the show ring be sure the tail is clipped and the head trimmed up. Best results will be secured by clipping against the grain of the hair. Hand or power clippers may be used.



9—This shows the manner of clipping the head, particularly around the horns. Notice that he is clipping the "wrong way" of the hair. On the other side of the head the clippers would also point in as the hair lays in different directions on the forehead.

10—Trimming the ears can be easily done with a pair of shears as shown here. The important thing is to cut out the long hair that grows inside the ears. If your calf has a yellow secretion in its ears, don't remove any of the secretion.

11—In removing the blanket, grasp it at the neck and pull it back in this manner. You are then pulling in the same direction that the hair lies and will not ruffle it up.

12—For weeks, and even months, before fair time you have been diligently brushing your calf every day. Never neglect this daily duty. It not only gets rid of the loose hair and smooths the coat out but it massages the skin, thus aiding circulation, and altogether puts the hide into good condition.

13—No special equipment is needed for this job. It is hard to beat a good hand rub, following the brushing, to make the coat glossy. Use lots of elbow grease, putting one hand over the other in windmill fashion and rubbing with the grain of the hair.

14—The finishing touches can be put on your calf by a gentle rub-down with a flannel cloth moistened with sweet oil. The latter can be obtained at a drug store. You remember that Dorothy Domke even took her rubbing cloth into the show ring with her.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

Many of you juniors are interested in building a good dairy herd. Some day perhaps you will have a herd of your own. A good start is half the battle. You will find many splendid pointers in the article "Selecting Animals for the Dairy Herd" written by E. B. Fitts, in the July 18th issue of Hoard's Dairyman. In this issue also you will find a partial answer given by Professor Fraser, University of Illinois, on what to do when bluegrass fails.

What should you consider in selecting a breed of dairy cattle? In the first place, you want the kind of cattle in which you yourself are most interested. In the second place, it is well to consider the breed common in your community, because this gives you considerable advantage in marketing both your products and your surplus cattle. As perhaps you know there are five important dairy breeds which are Holstein, Guernsey, Jersey, Ayrshire, and Brown Swiss.

How can you pick out a good cow? In selecting individuals for your herd consider first the production of the animal which you are purchasing; second, the production of the dam—if there are records available—and the records of her sire. There are also certain outward indications which enable you to select a good producer. You look for a big barrel showing capacity, for a good udder, for a shapely head with prominent bright eyes and a large muzzle, and for an angular appearance.

How about the selection of a sire? It has been truthfully said that a sire is half the herd. It is important that you have a good sire. The safest method in sire selection is to choose a proven sire, that is, one whose daughters in milk have proved to be good producers and of good type. Bulls inherit the milking qualities of the cows from which they came. A good sire may increase the production of a herd from 50 to 100 per cent, or an inferior one may decrease it by an equal amount.

Describe the government plan for loaning bulls. Out in the West—Wyoming and Montana—there is a plan for the use of pure-bred Holstein-Friesian sires, fostered by the Dairy Division of the United States Department of Agriculture. Two yearling bulls have been loaned to two groups of farmers by this plan. These bulls were obtained from the Huntley Experiment Farm in Montana. Some of the rules governing the lease of these pure-bred sires are that the farmers feed and care for the bulls at their own expense, keep their herds free from tuberculosis, keep accurate milk records, keep the heifers until they have freshened once, be subject to inspection by the department of agriculture, and to return the bull to the department in as good condition as when obtained. Also all expenses for veterinary services are paid by the farmers. (See article "Loaning Bulls".)

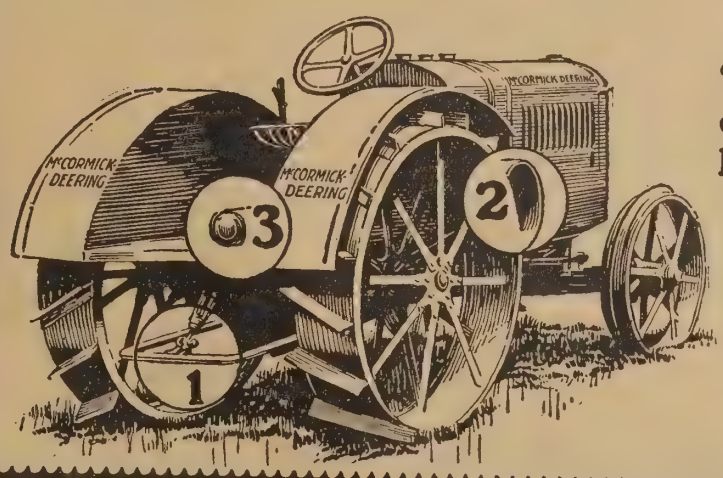
Name and tell how the new two-year-old Jersey champion was fed. Raleigh's Torono's Meme produced 902.15 lbs. fat containing 16,085 lbs. milk, with an average test of 5.6 per cent fat, establishing a new year-ly record for junior 2-year-old Jerseys. While on test she was fed 18 lbs. of the following mixture daily: 250 lbs. ground oats, 200 lbs. wheat bran, 150 lbs. oil meal, 50 lbs. cottonseed meal, 100 lbs. gluten feed, 100 lbs. hominy feed, 15 lbs. salt, and 8 lbs. mineral mixure. This feed was mixed with wet beet pulp. She received 35 lbs. of silage daily and alfalfa was before her at all times.

How can cows be economically fed when bluegrass pasture fails? They may be pastured on alfalfa if proper precautions are taken to prevent bloat. Among the most satisfactory and economical supplements to bluegrass, when other pasture is not available, are corn silage and alfalfa hay. (See "Ever Failing or Never Failing Pasture".)

Where does the permanent bluegrass pasture have a definite place? There are some areas which may be called natural pasture lands—hilly places, rocky slopes, badly washed land cut by streams or covered with trees and bushes, and areas impossible to drain. This type of land makes up 16.3 per cent of farm land in the nine chief dairy states.

Do You Know About the Power Take-Off?

The Greatest Improvement in Ten Years Is a Feature of the McCORMICK-DEERING *Tractor*



THE Power Take-Off helps you use the McCormick-Deering Tractor not only to *pull* your machines but to *run the mechanism of the machines* by power conveyed direct from the tractor through a revolving shaft.

This feature opens up great new possibilities for more efficient and bigger-scale operation behind McCormick-Deering Tractors. It does away with such well-known troubles as slipping bull-wheels, clogging and stalling where the ground-gripping action of the machine is not sufficient to run it.

The corn picker is one of the machines that demonstrates the value and efficiency of the Power Take-Off. Many corn fields will see its use this season. Grain binders [the new McCormick-Deering 10-ft. tractor binder which cuts 30 to 40 acres in 12 hours], rice binders, spray pumps, etc., may all be run under difficult conditions, when the tractor power *runs* them as well as *pulls* them.

McCormick-Deering 10-20 and 15-30 are especially designed so that this useful equipment can be added. You may not need it right away but it is ready when you want it in years to come. Make sure the tractor you buy is made for the power take-off and you will find it has all these things, too—crankshaft and crankshaft ball bearings guaranteed for life, removable cylinders, unit main frame, ball and roller bearings at 28 points, throttle governor, belt pulley, platform, fenders and brake. Write for a catalog or see the dealer.

INTERNATIONAL HARVESTER COMPANY
606 So. Michigan Ave. of America [Incorporated] Chicago, Illinois

2. **The Belt Pulley**
3. **The POWER-TAKE-OFF**

A Little Georgian Peach

Hoard's Dairyman Juniors:—I am one of your new club members. I received my Jersey button and necklace. I like them very much. I wore the Jersey button to school. I am a little girl ten years old. I have dark brown, curly hair, and weigh 100 pounds.

My Daddy is a graduate veterinarian but is working with the State Extension Force now. He has boys' pig clubs and calf clubs and teaches the boys how to judge live stock. I go with him to visit the clubs in the summer when there is no school. I am getting to be a pretty good judge myself. I know all the different breeds of cattle and hogs.

We have a new home Demonstration Agent. I am going to belong to a poultry club. I am going to try a setting of Jersey Black Giants. I want to see how big I can make them grow. Daddy is going to make me some capons and I am going to show them at the fairs if I have good luck.

I will be glad to hear from any of the juniors and will answer your letters. My address is Waycross, Ga. Marie Heyde.

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

Better Milk Bigger Profits

Keep your milk sweet and wholesome by cooling and aerating it with the "Chilly King" Prevent losses from souring and returned shipments

Chilly King
Cooler and Aerator

Cools milk perfectly—without ice—and secures its thorough aeration. Simply built. Easy to clean—no filth-catching corners. Milk flows in a thin film-like sheet over V-shaped Spiral Rings. Practically 100 per cent efficient. Sizes for all-sized herds. Write for catalog.

STOCK FOR SALE

I have usually 100 head of registered and high grade Holsteins on hand for sale. Also registered and imported Percheron and Belgian horses. RALPH HUDSON, Milton Junction, Wis. 12-*

For Sale—At "The Big Farm", Rosendale, Wisconsin, high grade and pure bred Holsteins by the carload. Also will help any buyer to select anything in dairy line in either Holsteins or Guernseys. JOHN MURPHY and JOHN FARRELL, Rosendale, Wis. (Formerly of Mukwonago, Wis.) 5-*

Holsteins For Sale—Will have to sell a number of young cows cheap; also some heifers and calves; all stock tuberculin tested. Write for particulars. E. F. THOMAS, Oconomowoc, Waukesha, Co., Wis. 11-*

Springers—10 Registered Holstien cows and heifers, cheap. AUGUSTINE BROS., Pound, Wis 19-*

My entire herd of Registered and high grade Holsteins. Just finished their second T. B. test, all clean. Would like to exchange my bull, Pinehurst Melchior Sir Ormsby No. 291577. His two nearest dams average, butter 365 days, 1094.26; butter 7 days, 32.50. W. J. GOLLMER, Apple River, Ill. 1-2

We offer another car of extra high grade Guernseys, three to five years, due to freshen from August first to September first; could furnish some July cows if desired. We feel that no finer, more uniform lot of cows was ever offered. Good size, fine conditions, exceptionally well marked, perfect udders. These cows will easily milk from 45 to 50 lbs. per day twice milking and have been selected as future trade builders for us in the locality that is fortunate to obtain them, from about 500 head. Federally tested, terms cash, prices reasonable. If you need them don't waste time in writing; come and inspect them. Also a few registered fall cows and some grade heifers bred from three to six months. One very fine registered first calf heifer due in July. MARA ALVA FARMS, Smithville, O. 25-*

Registered Guernsey heifers and bull calves. FAIRVIEW FARMS, Brodhead, Wis. 13-*

Registered Guernsey bull calves from high testing dams. Accredited herd. Reasonable prices. QUINELLO FARMS, Thiensville, Wis. 23-*

Oakland Guernsey Farm—(Since 1890) Mukwonago Wisconsin, offers carload high grade Guernsey springers, choice of our herd. T. B. tested, 5-six weeks old heifer calves $150, express paid. 24-*

For Sale—Registered Guernseys, male and female, of May Rose Bell Buoy of Linda Vista breeding, who has 32 A. R. daughters with records up to 769 lbs. fat. $50 and up . Federal accredited herd. O. R. SCHWALEN, Roberts, Wis. 23-*

Young Guernsey Bulls, A. R. breeding. Federal accredited herd. MATH. MICHELS, Peebles, Wisconsin. 24-*

Conkles Dairy Farm offers one carload of Registered Jersey bred heifers, T. B. tested, will freshen in fall and early winter. This is a good lot at a reasonable figure. CONKLE'S DAIRY FARM, Layland, Ohio. 1-4

Ayrshires—Choice cows and heifers. Good breeding, tuberculin tested. Price reasonable. CHAS. DUNBAR. Elkhorn, Wis. 1-2

Hereford Cattle for Sale. 163 yearlings, 186 two year olds. Sell one load or all. A. C. WISECORUER, Fairfield, Iowa. 1-3

Married man, Hollander, 28 years old, no children, wants position on large dairy farm. Life time practical experience. Condition and salary first letter. Address BOX 217, care Hoard's Dairyman.

Walker Dairy Fellowship

Among the gifts announced at the commencement exercises of the University of Vermont is one providing a $1,000 post-graduate fellowship for three years in the Dairy Department of the College of Agriculture. It is suggested by the donor, George H. Walker of Massachusetts, that a study be made of the production and handling of milk on relatively small farms and plants, of the feasibility under such conditions of producing and marketing milk which is chemically and bacteriologically clean and uniform in its fat content, and of the practicability of doing this at a not undue increased cost of production.

Mr. Walker was born in Vermont and is the founder of the famous Walker-Gordon Laboratory Company which supplies "certified" milk throughout the more thickly settled portions of the North Atlantic States. He is still actively engaged in the management of this enterprise which was the forerunner in the country, if not in the world, in supplying a safe, cleanly product for infant feeding. He has made a great success of his business from every point of view.—Vermont College of Agriculture.

UNION PACIFIC SYSTEM — OVERLAND ROUTE

Dairy Development

is going ahead faster in some of our Western States than in others, because in such States the fact is recognized that those districts in which dairying and balanced farming are carried on, extensively, prosperity reigns; that, although those lines of endeavor mean continuous employment, a steady stream of cash flows in.

Idaho offers exceptional opportunities to "dairy-minded" persons, and, if you will drop me a line, I'll be glad to send you, absolutely FREE, a copy of our illustrated folder entitled, "Dairying in Idaho." Ask me for information covering Round-Trip Special Homeseekers' Excursion Fares, in effect March 4 to November 18, 1924.

Cedar Grove .. .. New Jersey

A Brown Swiss Champion

HOARD'S DAIRYMAN:—Knowing that you are interested in the progress made by the various breeds of dairy cattle, I am sending you a picture and a short review of a new world's record made by Buster's Pride 11260, a Brown Swiss cow owned by Jubilee Farm of Illinois. She has just qualified in the 305-day division of the 4-year-old class with a record of 12,500.3 lbs. milk and 552.59 lbs. fat, which exceeds the former record for the class by more than 41 lbs. fat.

As a three-year-old Buster's Pride has a record of 11,946 lbs. milk and 555 pounds fat. The world's record just completed was started after a very brief rest period and was in the process of making while the cow was a member of our show herd last fall.

Showing as a four-year-old Buster's Pride won first place at the Wisconsin State Fair, and second place at the Minnesota State Fair, the Illinois State Fair, The Dairy Cattle Congress, and the National Dairy Exposition. In addition to these winnings she was third prize junior A. R. cow at the Dairy Cattle Congress and the National Dairy Show.

A new Brown Swiss Class Champion, Buster's Pride, owned by Jubilee Farms of Illinois, takes first place in the 305-day division of the 4-year-old class with a record of 12,500 lbs. milk containing 552.59 lbs. fat.

Buster's Pride was bred by Sam Moser of Illinois, and was purchased by Jubilee Farm as a calf in the Morton Sale. Her sire is Buster Brown G, a son of the famous show bull, Myone Boy. Her dam is Dairy Maid of Tremont, who is a daughter of Dairy Rose, the grand champion cow at the 1923 Illinois State Fair.

Illinois. R. C. KLUSSENDORF.

National Dairy Exposition

The best we can do is to repeat the recommendations passed at these conferences and let you judge for yourself. Here they are, approved by the Show Management:

1. "As a means of creating interest in the relation of dairy type to production, a class of cows should be provided for a culling contest.

2. "A judging contest should be arranged for in which only farmers shall be eligible. Through county elimination contests, teams of three shall be chosen from each county, and no county shall be represented by more than one team."

This will mean a new day in Badger live stock circles.

3. "A sale of cow testing association cows should be held with two groups; one group representing good heifers with dams of known production and another with good type cows whose production records are known."

4. Not satisfied with these big bites, some recommend that "dairy breed days be held in preference to county days". Others came back like this: "In addition to dairy breed days it is recommended that special days such as cheese day, butter day, milk day, and boys' and girls' day be held, and that special programs including pageants, etc., that will dramatize the dairy industry, be a part of these special days."

5. With this they spoke volumes, but—"We also recommend an exhibit and parade of famous cows and bulls of the various breeds, and a special and carefully selected exhibit to point out the value of pure-bred sires, cow testing association cows, and Advanced Registry sires and cows."

6. Still others gave vent to their pent-up Badger enthusiasm in an entirely different vein: "We recommend that special effort be directed toward the proper advertising of the food value of milk and as specific suggestions recommend:

A. Community and county health contests of

1. Babies by public health organizations.

2. Boys by Boy Scout and similar organizations.

3. Girls by commercial and newspaper contests.

4. That local contests culminate at the National Dairy Show in final contest.

B. Portrayal of experimental evidence showing food value of milk.

C. Newspaper and other forms of advertising correlated with the general advertising of the Show."—Wisconsin's Milky Way.

Norman's Missaukee Red Rose

HOARD DAIRYMAN:—On the Mountrose Farm, Ohio, is a man who not only follows the idea out, "'Always speak to a cow as you would to a lady," but goes away beyond it. He treats the cows which he handles as if they were Metropolitan Opera Stars, which are supposed to be the most temperamental female creatures in existence.

Cave-man stuff never did work with cows and never will. The barns where kindness and good care are part of the daily system are where we find big figures on the milk sheet which generally find their way into the A. R. lists of the breed associations.

The man we refer to is Charles H. Knight, and a cow he has cajoled a world's record out of is the Guernsey, Norman's Missaukee Red Rose 89724, who has made a semi-official record of 17,527.2 lbs. milk, 900.7 lbs. fat in class C. This is her second large record, as she made 15,122.3 lbs. milk and 760.72 lbs. fat in Class GG which put her at the head of the Honor Roll.

It is well within the bounds of possibility that she can become the top cow of the Guernsey breed. Red Rose is well named, as she is a beautiful dark red fawn color, with a hide like silk—pliable, soft, and glossy. She's a large cow, but of great quality and wonderful finish—we'd back her for a blue ribbon in a show ring any day.

Her tastes are as decided as they are varied. She loves "Charley" Knight and apples and cocoanut meal, and she sure does hate a "vet". We were in her stall admiring her and listening to her proud owner tell about her, when she began to get restless and toss her head and roll her eyes and show signs of something wrong. We heard footsteps in the other end of the barn and Mr. Knight said "I'll bet that's the Doc, and she knows he's coming towards her". Sure enough, it was the veterinarian

NORMAN'S MISSAUKEE RED ROSE
Year's record: 17,527.20 lbs. milk, 900.70 lbs. fat in Class C.
OWNED BY CHAS. H. KNIGHT, OHIO

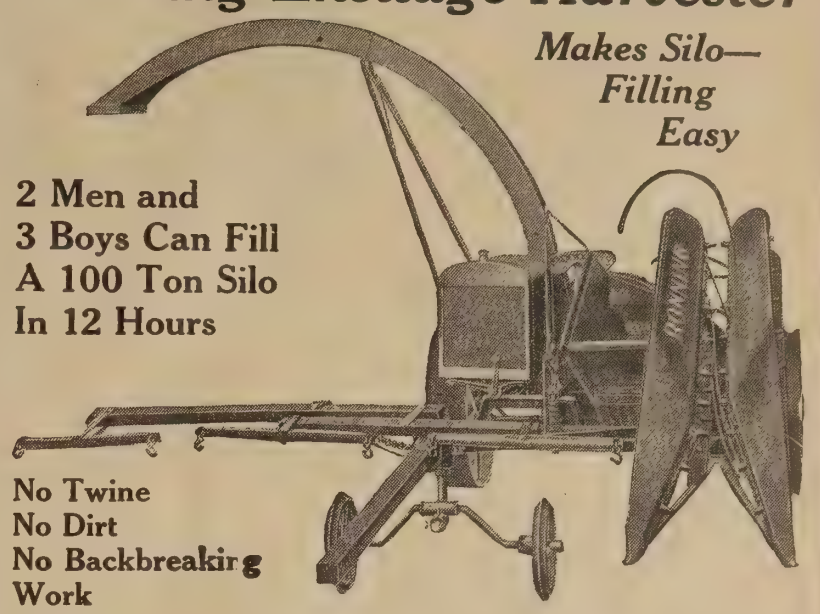
coming to do his regular stunt of keeping the herd fit. While Rose may know that his intentions are all right, she certainly doesn't like his execution and even though Mr. Knight put his arm around her and assured her that it was "all right and he wouldn't let her get hurt", she didn't feel quite her placid and dignified self until the doctor had departed.

Mr. Knight says, "Rose and I are going after world's record for Guernsey breed all ages next trip." Taking into consideration everything we know about the man and the cow, and noting that co-operative "Rose and I", we think Countess Prue's crown is going to begin to slip right soon.

Michigan. GEORGE LESLIE.

Michigan College Announces 7th Annual Farmers' Day

On Friday, August 1, the Michigan Agricultural College, at East Lansing, will act as host to thousands of Michigan farmers, their wives and children, and others who are interested in agricultural progress. The day will be in the nature of a big family picnic. The beautiful 105-acre campus furnishes excellent facilities for such an occasion.



One of the features of the day will be a hay making demonstration on a twenty-five acre field of alfalfa which will show in operation the best and cheapest methods of making hay with modern hay making machinery. This feature will also include an Old Timers' scythe contest which is open to the pioneer farmers of Michigan who used this method in their younger days.

Michigan. E. B. HILL.

Co-operation is not a mystic formula that works without direction or labor. On the contrary, co-operation, to be successful, must be composed of one-tenth system and nine-tenths hard work and sacrifice. And very often one-tenth of the members do nine-tenths of the work.—Citrus Leaves. (California).

Ronning Ensilage Harvester

Makes Silo—Filling Easy

2 Men and 3 Boys Can Fill A 100 Ton Silo In 12 Hours

No Twine
No Dirt
No Backbreaking Work

In One Operation—Without Manual Labor it Harvests Your Corn—Cuts it into Silage—and Loads it into the Wagon Ready for the Silo.

Pays For Itself In Two Years

Picks up any kind of corn—tall—short—thick—thin—drilled—down—or tangled. Even corn mixed with soy beans and vines are easily handled with the Ronning, and it leaves a clean field.

POULTRY On The DAIRY FARM

J. B. HAYES

Culling for Profit

Selection for egg production with the sale of the poorer producers has become a year round practice in the hands of flock owners that have had some experience. Even now too many people believe that this work can only be done during the summer months. The months of July, August, September, and October are the most propitious, for the work shows to best advantage during that time. If one obtains the needed experience during that time the idea should be expanded into a regular practice instead of a seasonal house cleaning.

Late spring culling is practiced to a great extent. One party sold ninety birds from a flock of 290 with a decrease in production the following day of only five eggs. The hens were sold at twenty cents per pound and the excess males that were not to be held for breeders the following year for twelve cents per pound. It was needless to state that this man had accomplished the ideal of obtaining a greater production per unit and had materially decreased the feed consumption for the flock as a unit. In that combination lies the hope for more efficient marketing.

When one culls during the summer season it should be possible, in most flocks, to remove at least one-third without decreasing the production. In many cases it has been possible to cull out that many and increase the production of the remainder above what the entire flock had been able to reach. At any time the average production per hen can be increased. In one instance with a total production of 1906 eggs the average per hen was 15.88 but after culling, although the total dropped to 1,493 eggs, the average increased to 16.59 eggs. This is an average example in a well managed flock and not the extreme that could be given.

Ability to produce is determined by ability to properly digest and assimilate feed efficiently. This feature is indicated by proper body conformation. An ideal is a long, wide, deep body that indicates maximum capacity. As the fowl is viewed while standing, one's eye can detect the faults such as shallow body, deficient depth, or lack of vigor. When handling, the spread across the back as indicated by the distance between the thumb and fingers with a flat appearance, tells part of the story. Width across the hips is not only desired but that width should be carried back through the bones at the side and rear of the fowl. This is called "slab sided" and is found in heavy producers while a lower producer will be round bodied.

Extreme width is often found in a "sloper" or, in other words, will pinch in at the rear. This is objectionable as it limits space in the abdominal section where width is desired. A great depth from the back to the keel bone is desired. Males or females that have extremely short keels or slope up abruptly in the rear emphasize the same condition from another direction.

Other more simplified points may be used in detecting the loafers. In the past points have been emphasized that should not have been recognized or, at least, not used in the way that was advanced. Trap-nesting has been the foundation on which culling is based and resulting physical indications or changes due to production, have been tried and finally accepted as guides. One must remember that the more points considered and the closer they check the surer the work will be. Most failures in culling result from taking just one factor and using that to the complete exclusion of all the others.

Starting with the head one has a very definite index of production possibility in either sex. To the casual observer all birds look alike but there is a vast difference between what is wanted and what often happens.

In the vigorous, high production birds one will find a head that is relatively short, deep but clean cut, and free from wrinkles or coarseness. The eyes appear to be full, round, and stand out prominently. One should be able to see the eyes on either side of the head when looking over the back of the head. A prominent, full, "shoe button" eye is desired.

In the category of undesirables is the large, coarse head and wrinkled face. One may justly claim that the puffy appearance may be due to age and it is true. Since the first year of production under average conditions means the highest yield, older hens should be culled out as poorer producers and this wrinkled appearance, whether due to age or inherited low fecundity, indicates the condition. Generally associated with this character one will find that the eye is sunken, the comb rather coarse and masculine, the wattles large and wrinkled while the head seems to be a brilliant color. The color indicates health and not production, for many of these birds might be easily mistaken for males.

At the opposite extreme of the ladder is the hen that has received all the publicity but is only seen in a few instances. She is the "crow or shake" head which means low vigor, vitality, and production. Publicity has made this hen and people look for that type while they overlook the worse offender, the coarse head.

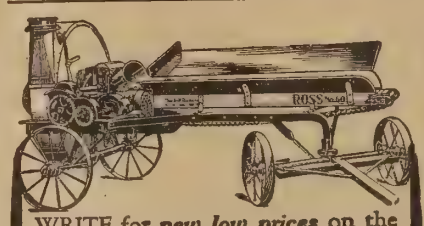
A real extreme type has a long, slim head that is lacking in depth, the eye is sunken, the comb and wattles never reach normal maturity, and she looks weak, unthrifty, inactive, and would be culled on general appearance. Do not, however, confuse her with a neat, vigorous fowl.

A little study of the head types will quickly acquaint one with what is desired so that the others may be discarded. Time and observation are required for, in the past, we have always considered the hen as part of the flock rather than an individual that is required to do her share in making a profit.

A Poultry Tour

The third annual poultry tour of Northwestern Wisconsin county agents and farmers to Barnum, Minn., was made June 24.

Only five poultry farms were visited, the largest one being the Hugo Anderson farm where 4,000 hens are regularly kept and a 30,000-egg incubator is operated on this 23-acre place. Mr. Hansen, who organized this poultry community in co-operation with the University of Minnesota several years ago, is still owner of the creamery and handles all of the production of poultry and dairy products from nearly 400 farmers in this community. Not only do people cooperate in standard breeds but in buying the right kind of feeds and in providing the right kind of equipment and raising the right kind of chickens.



Marked progress in the poultry development of Northwestern Wisconsin comes as a result of these poultry tours. Farmers who visited the Barnum poultry tour only two years ago have tripled their flock and have up-to-date poultry equipment after only two years' time, which shows that "seeing is believing".—GEORGE BRIGGS.

Dept. 201 Springfield, Ohio

Successors to The E. W. Ross Co., Est. 1850

Your Neighbors Will Help Pay For It—

One Rowell Trojan Ensilage Cutter owner tells us that last year he filled 18 silos after he filled his own—and he made a good profit on every job! His neighbors practically bought his outfit for him the first season.

Your light tractor will run any of the three sizes of Trojan Cutters easily, cutting from 8 to 17 tons an hour, and lifting the silage into the tallest silos.

Hyatt roller bearings; guaranteed-for-life steel flywheel; end-thrust bearings; extra-strong, twist-proof steel main frame; automatic feeder; convenient control from either side—these are a few of the features that make the Trojan the cutter for you.

PROLIFIC BREEDERS STRONG—HEALTHY Animals Guaranteed

Largest profit producing live stock in the world. A great many Dairymen already started. large profits with very little additional work. You waste enough every day to feed several pair. Don't hesitate, write today for our catalogue and information, its interesting.

UNITED STATES SILVER FOX FARMS,

302 Star Bldg., Minneapolis, Minn.

Why the Papec Has Three Rolls

THE Papec has two strong feeding rolls, each cast in a single piece. These have long teeth which grip the stalks and clean themselves on the shear plate. They automatically adjust themselves to the amount of corn fed.

Besides these, the Papec has a Compressing or Gathering Roll. This strong angle-steel drum works independently of the upper roll, beating crooked stalks and bulky leaves in to shape for the feeding rolls. Together with the positive action apron, this Third Roll makes a perfect self-feed on all sizes. You save the wages of one man and do a better job.

This is but one of many features which make the Papec the most economical of Cutters. It needs practically no repairs and requires less power. It is guaranteed to fill the highest silo, when running at only 600 r.p.m. Four sizes; R-10, N-13, L-16 and K-19.

Our new catalog and U. S. Gov't Bulletin "Making and Feeding of Silage" will show you how to get bigger profits from your silo. Both free to silo users—write today.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

The Lame, Stiff Cow

It is quite common for pregnant cows to become stiff, sore, lame, or inclined to paralysis. In some instances they have great difficulty in rising when down and some old cows become completely paralyzed after showing such premonitory symptoms for some time. In all cases of this sort we advise, as the first step, the application of the tuberculin test, if that has not been done. The reason for this is that tuberculosis quite often affects the bones of the spinal column, in the region of the loins, or may attack the joints, especially the stifle joint, at the flank, or the bones about the fetlocks. When that is the case treatment, of course, is not worth while, for the disease is incurable and contagious and also makes the milk dangerous for use by man or animals. In many cases of the sort described tuberculosis has proved present and the animal had to be destroyed. Testing of the entire herd then is in order.

An unsuspected cause of stiffness and lameness in dairy cows, especially in pregnant ones, is deficiency of lime in the bones and of phosphorus in the blood. In recent years it has been pointed out by nutrition chemists that when a cow does not receive sufficient lime and phosphorus in her ration she has to obtain it somewhere if she is to go on yielding milk and developing a strong fetus in her womb. There is only one source possible to her when the ration is deficient in the needed elements and that is her own blood, tissues, and bones. It is quite possible for her to so severely draw upon her bones and possibly her nerves for lime that they weaken and she becomes lame or even goes down paralyzed in the worst cases of the sort. Confinement in a stable, lack of exercise, and especially lack of opportunity to bask in direct sunshine are contributory causes. Evidently prevention is all-important and it comes from supplying the cow with a complete ration and especially an abundance of alfalfa to supply lime and needed vitamins, one of which stimulates lime assimilation. The cow should also be allowed to exercise outdoors every fine day and in the stable should occupy a roomy pen or box stall.

There would be far fewer stiff, lame, sore cows were the animals moved into clean, roomy, sanitary pens well before calving time. We think it likely that, in time, stanchioning of cows will give place to allowing them their freedom in a well bedded, covered court or barn during the day time and night when they are not on pasture and stanchioning only at milking time, the milking to be done by machine. As calving time approaches the cow will then be separated from her mates in the covered court or "rotunda" of the cow stable, and be allowed a separate, roomy, bedded pen specially prepared by cleansing, disinfection, and whitewashing, including the floor. Under those conditions and when the cows are tested periodically to detect and eliminate those affected with tuberculosis or with Johne's disease and are supplied with a ration that fully supplies all of the needs of the body and obviates the necessity of self-robbing of mineral matters, stiff, lame, weak, or paralyzed cows will rarely trouble their owners and prove profitless in the herd.

Preventing Sucking

Could you tell me how to prevent yearling calves on pasture from sucking each other? Several of them are very persistent in this habit although they were stanchioned and fed grain after their milk last winter in the approved manner. Is there any offensive preparation we could smear on the teats of those sucked to keep the others away?

Norma, Nebr. J. T. T.

It is customary to put spiked halters on the sucking calves but there is some danger from wounds where that is done. Tincture of myrrh and aloes, or a mixture of powdered Barbadoes aloes and lard or oil is fairly effective in preventing sucking, but must frequently be applied. It would be better to separate the sucking calves from the others.

Hard Milking Cow

I would like to know if there is a remedy for a hard milking cow. I have a good one but hard milker.

Ogden, Utah. W. S. R.

We take it that all four teats are hard to milk, the openings of the ducts being small. If that is the case teat plugs may be inserted between milkings, provided they are sterilized by boiling and smeared with carbolized vaseline each time before insertion in the teats. If that does not suffice a veterinarian should be employed to use a dilator of the glove-stretcher pattern or he may need to use a teat slitter (bistoury). In some cases letting a calf nurse at these times makes milking easier.

Calf Scours Cured

HOARD'S DAIRYMAN:—A gentleman from Bonduel, Wis., had an article on calf scours in the May 9th issue of Hoard's Dairyman, and wishes a reply from a reader who has tried it and succeeded.

Ten days ago I had a heifer calf that had the scours so bad it could hardly stand up. We tried various treatments but with no effects. On May 9th I ran across the article by E. K. of Bonduel in Hoard's Dairyman and made up my mind to try it. After the third dose of this mixture the calf was completely cured and is now drinking milk and is in fine condition.

It certainly is a simple remedy as the ground ginger and baking soda are always on hand in the kitchen, and the powdered or prepared chalk can be had at most any drug store.

This remedy for calf scours should be had by all dairy farmers as I know it will prove successful to them. I wish to thank T. K. and the Hoard's Dairyman very much for that article.

Menomonie, Mich. A. W. W.

Abortion in Swine

Of late years there have come increasing reports of contagious abortion in sows and it seems to persist for three to five years in the same herd. Sows generally contract the disease from each other rather than from cows or other species of animals.

No drug or medicine has yet been found that will cure the disease, but the Wisconsin Experiment Station suggests in Cir. 169 the following method of managing infected herds:

1. Remove aborting sows at once from contact with other sows and gilts.

2. Collect and burn aborted pigs, afterbirths, and all contaminated feed and litter.

3. Find out whether the abortions were caused by abortion germs by having blood samples tested to detect evidence of the disease.

4. Consider the herd infected if any of the blood samples are found to react to the test for abortion.

5. Divide the non-reacting sows into as small groups as possible.

6. Disinfect the hog houses by thoroughly saturating the floor, walls, and troughs with a coal-tar disinfectant prepared and applied according to the directions of the manufacturer of the product.

7. Sell for slaughter grade sows which abort as soon as their condition permits as such animals will scarcely pay for the trouble of treatment.

8. Postpone breeding sows that have aborted until they have passed at least two heat periods.

9. Keep a special boar for the aborting and infected sows. This, of course, is impractical except in large herds.

10. Provide a clean boar for all sows that show no evidence of infection.

11. Ask your veterinarian to secure vaccine from the College of Agriculture to vaccinate all open sows and gilts that have not aborted in order to prevent them from contracting the disease.

Remedy for Scours

HOARD'S DAIRYMAN:—In recent issues I noticed inquiries for a remedy for scours in calves.

I have been successful in using about a teaspoonful of "B-K" in milk fresh from the cow, feeding it from a bottle.

Just last week I had one that had the scours and refused to stand or drink. I gave him three doses and he came along fine.

HERD ACCREDITED SHERMAN JERSEY FARM, Charles City, Iowa

Iowa Six Months' Dairy Course

The six months' course in dairying begins this year September 22 and closes March 20, 1925. This course is divided into two quarters, the first quarter closing December 19th and the second quarter beginning January 5th.

This course is intended for men who are interested in commercial dairying. Butter, ice cream, and cheese factories and market milk plants all draw upon the six months' course for men.

A student desiring to enter the six months' course must be at least seventeen years of age and must have satisfactorily completed the eighth grade of the public schools or its equivalent. Although it is advisable that he have some practical experience before enrolling, this is not a requirement. Students with some experience may be recommended for positions by the department after one three months' term, but those without previous practical work are required to complete satisfactorily the six months' course before receiving the recommendation of the department.

For further information address Dairy Department, Iowa State College, Ames, Iowa.—M. MORTENSEN.

Safety in a Nutshell

A fifteen year-old girl of Detroit has written these slogans for automobilists:

"Drive right and more pedestrians will be left."

"Watch your 'step on it'."

"Taking the other fellow's dust is better than 'to dust returneth'."

"Six feet have awaited many a driver who wouldn't give an inch."—Boston Transcript.

Ohio Ayrshire Record

Belle Moonshine's Choice, owned by E. R. McConnell of Ohio, becomes the Roll of Honor senior three-year-old Ohio Ayrshire champion on her 300-day production of 10,786 lbs. of 4.17% milk, 450.07 lbs. fat; carrying a living calf 213 days of this period. —Ayrshire Breeders' Association.

AUGUST ZIESING, Deerfield, Illinois

Four Pine Farm Guernseys

The dairy cow earns her place in the Sun because of her ability to produce human food and milk. Only sound breeding is production first with type a close second. Those who breed for type and forget production have no right to succeed with the dairy cow.

FOUR PINE FARM has always given producton first importance in their breeding operations. Yet we have not lost sight of type.

A FOUR PINE FARM PRODUCTION BRED BULL WILL BRING TO YOUR HERD BOTH TYPE AND PRODUCTION. Write us for information about the young bulls we have to offer.

F. K. BABSON, Owner HINSDALE, ILLINOIS E. D. COMSTOCK, Jr., Manager

CHERUB'S PEARL ROYAL OF SHOREWOOD 58824

LONE PINE GUERNSEYS MIKANA, Barron Co., WIS.

LONE PINE ROYAL REGENT 88513, born April 4, 1923, is ready for immediate service. He is a growthy young fellow with plenty of length and depth. He has a strong, straight back and is medium fawn in color. SIRE, CHERUB'S PEARL ROYAL OF SHOREWOOD 58824, grand champion 1921 National Dairy Show and son of Ladysmith's Cherub, 3 times grand champion at National and sire of 11 A. R. daughters. DAM, LONE PINE DELIGHT 92446 A. R., 589 lbs. fat as Jr. 4-year-old. As 4-year-old placed 4th at Wisconsin, 2nd at Michigan, 5th Eastern States, and 5th National Dairy Show—all during year 1923. This calf is priced to sell. Let us hear from you.

Owners; H. L. & F. D. STOUT (*Fed. Accredited Herd*) 501 McCormick Bldg., Chicago.

EL JANE GUERNSEYS ARCADIA, MISSOURI

(85 miles south of St. Louis)

Not the largest herd but an exclusive herd of pure-breds. Every cow with a record, now on test, or in preparation for test.

Our recent BULL SALE was very satisfactory. We shipped animals into Iowa, Illinois, Ohio, Kansas, Colorado, Missouri, and Mississippi, during past 7 weeks. True enough, they were sold at about half their value, but these animals will give a good account of themselves, and we will get our reward later.

We now offer to some discriminating breeder or farmer the pride of our herd, Nonpareil of El Jane, 18 months old. He is out of one of our A. R. dams who made 504 lbs. fat in class E—and is sired by Dairymaid's Nonpareil of Iowa, who sired a class A cow that recently made 998 lbs. fat. Would you care to own a half brother to a 998-lb. cow? Beautiful animal, straight, and can be bought RIGHT. Still have several young bull calves for sale. Federal Accredited Herd.

EL JANE FARMS, - Arcadia, Missouir

MARSH FARM GUERNSEYS

Founded upon CHERUB blood, combining modern show type with production. At the last 13 National Dairy Expositions 46 out of 78 championships have been awarded to cattle from this farm. There are now in the herd 40 cows with yearly records of 500 pounds of fat in Class G. to 900 pounds of fat in Class A. In your efforts to improve the type of your cattle, the show ring records indicate Cherub blood as the really sure way. We will be pleased to advise with you about your next sire.

Wm. NISBET & SONS, Richland Center, Wis.

Your Boar

HOARD'S DAIRYMAN:—The time to breed for fall pigs will soon be here. Is your boar in the best condition possible? Is he a boar you can be proud of? Most all dairymen know the value of a pure-bred bull, but how many carry it on to the boar? The boar must be a good individual, be a good representative of the breed, and have a good pedigree. He should be strong in points desirable and especially so in points which are not usually found in animals of the breed. The extra "big type" is not in such favor at present. The bone is important but it can be overdone. In the Ton Litter Contest in Ohio, the sire of all litters weighing a ton were pure-breds.

It is important that the boar should be registered. This is the only way of knowing that the boar is of good stock and not a scrub. This can be carried to an extreme; a good individual is better than a registered scrub. There has in the past been complaint of crookedness on the part of breeders in recording pedigrees, but this is all practically eliminated. Every one is fighting the crooked breeder.

Is your boar in a good lot, where he can get plenty of exercise, or in a stuffy, dark, and dirty hole in some out of the way place? A good place for the boar is in the bull lot, they seem to quiet each other some. His bed should be clean, warm, and well ventilated. It should be located so that it will be dry and where the sun can strike it for several hours a day. The movable hog house is very convenient for the boar. Your state experiment station probably has several bulletins on the construction of these houses. The boar should never be allowed to run with the herd. No accurate records can be kept of breeding when this method is practiced and the boar will be harder to handle. In the corn belt there is a great tendency to feed too much corn. This makes a poor breeder of any boar. The ration should be narrowed, meaning that it should consist of a large amount of feed rich in protein. Skimmilk is fine feed and is usually cheap. Tankage and oil meal are both good feeds also. When possible the boar should be allowed to run to alfalfa, clover, or soy bean hay. These are rich in protein. During the breeding season the ration should be narrower than ever. A good mineral mixture is also almost essential for the whole herd.

When the date comes for breeding, do not just turn the boar in with the sows; take the sow to him, one at a time and no more than two or three a day. When he has served them take them away.

Missouri. FLOYD A. POWELL.

Rhode Island Champions

Rhode Island has two new champion butter producing Holstein cows, according to the Advanced Registry Department of The Holstein-Friesian Association of America.

Amy Rag Apple Pontiac is now the state's leading cow for one year's production as a junior four-year-old with a record of 23,461.7 pounds milk and 786.37 pounds butterfat—equal to 982.9 pounds butter. She is owned by J. E. Singleton.

For one year's production as a junior two-year-old Mabel Model Konigen, of the H. B. Ayers herd, holds the state's highest record with 18,686.8 pounds milk and 566.96 pounds butterfat, equivalent to 708.7 pounds butter.—Holstein-Friesian Ass'n of America.

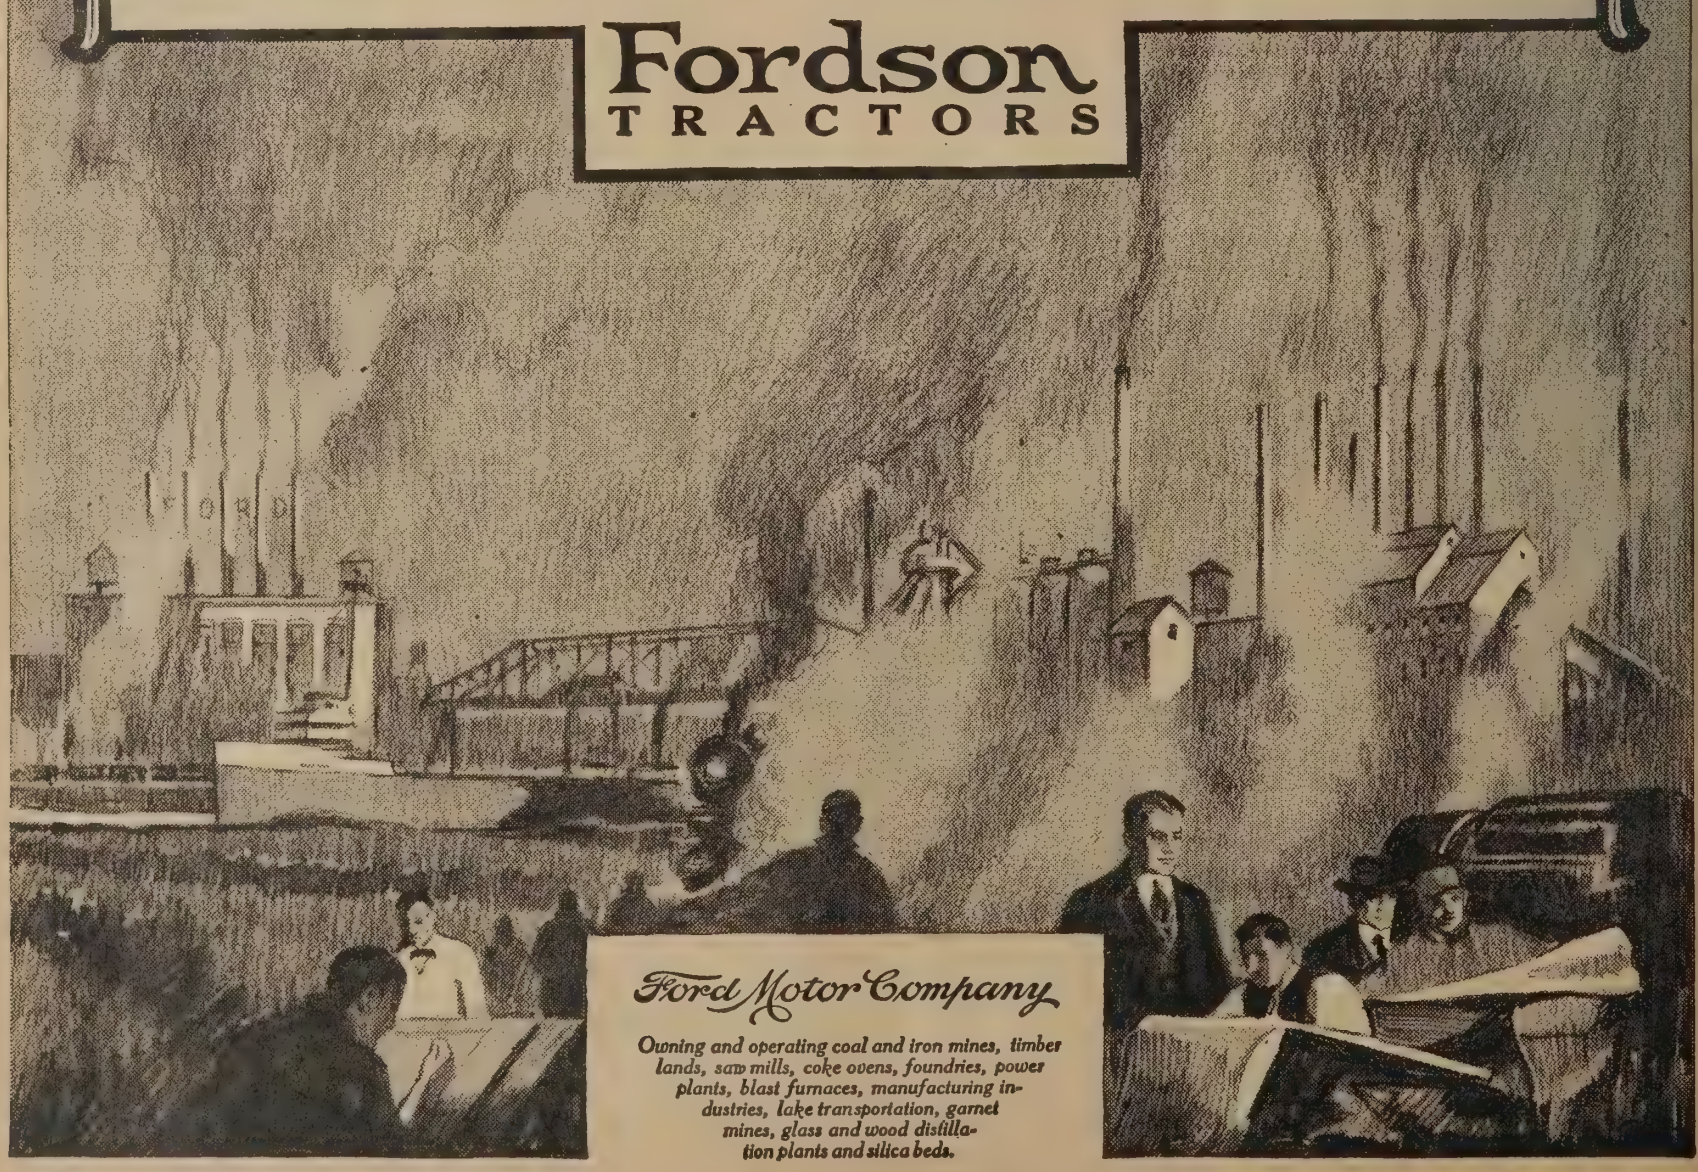
Why Fordson Tractors cost so little and give so much

Between the American farmer and the Ford organization, there has always been the closest understanding.



By continuing its service to the farmer from year to year, the Ford organization is realizing the Ford ideal—"greatest service to the most people".

To accomplish this, the Ford organization has acquired and controls vast timber lands, coal and iron mines, transportation routes, and channels of distribution; built giant factories, mills, foundries, furnaces, warehouses, docks and power plants. Without these vast Ford resources, the Fordson Tractor could not be sold for so little, could not give so much in superior quality and service.

The Fordson Tractor does more, for less money, than any other farm power unit. It is a practical, time-saving aid in plowing, harrowing, planting, mowing, harvesting, threshing, road-mending and scraping, timber-cutting and sawing, hauling, pumping, excavating—in fact every duty the farmer must perform which requires power.

The Fordson Tractor makes farming easier and more profitable. The Fordson Tractor enables more work to be done in less time, thus permitting the farmer to have more leisure for making his life and the lives of his family happier and more abundant. By thus lightening the farmer's burden, the Fordson Tractor renders its great service to the American farmer.

Fordson TRACTORS

Ford Motor Company

Owning and operating coal and iron mines, timber lands, saw mills, coke ovens, foundries, power plants, blast furnaces, manufacturing industries, lake transportation, garnet mines, glass and wood distillation plants and silica beds.

NEW YORK EXPERIMENT STATION JERSEYS

How Founded and Developed

A. C. DAHLBERG, NEW YORK

NEARLY all old herds of cattle have an interesting history in which may be found many lessons of value. The history of the herd of pure-bred Jerseys owned by the New York Agricultural Experiment Station at Geneva has been carefully preserved and it contains many illustrations of valuable lessons in economical dairying. So far as the author has ascertained, the New York State Experiment Station is the only one in America that keeps no other cattle than Jerseys. The herd is also rather segregated from other cattle and the customary exchange of cattle so common in many herds has not been practiced. Furthermore, the herd is free from students' work. It compares quite favorably, therefore, with conditions that might exist upon the average farm if the average farmer desired to create them.

The author's predecessor, George A. Smith, established the herd and kept it under his careful supervision during the entire period covered in these articles with the exception of the last two years. It was he who began the practice in 1900 or before of weighing each milking and keeping all other records so essential to an understanding of the past. The author's part is one of interpretation and presentation of this material.

The Beginning of the Herd

The first annual report of this Experiment Station states that four Jersey cows arrived on November 30, 1882, after a two days' journey. They were in a "harassed and fatigued condition". In later years, Holsteins, Devons, Alderness, and Shorthorn cattle were obtained to use in an extensive breed test. When the comparison of the breeds of cattle for dairy purposes at this Experiment Station was ended in the 90's, it became evident to those in charge of the work that certain advantages were to be gained by eliminating all breeds but one. "Because of the expense of maintaining several breeds and because the type of experimental work contemplated would be best served by a fairly uniform herd, a Jersey sire was placed at the head of the herd and some Jersey cows added." These Jersey cows, all grades but two, which were added to the herd, were purchased in 1898 and 1899, and they constituted the major portion of the herd. This sire was purchased in 1901 and there were but two pure-bred Jersey females in the herd at that time.

There are but two methods of obtaining a herd of pure-bred cattle; namely, buy them or raise them. The expense of purchasing enough females of good breeding to fill a barn built for 26 milch cows is rather great and, furthermore, it may not be economical or within the means of the average farmer or agricultural experiment station to do so. For this reason the herd was developed by the purchase of bull calves to produce heifers from the two registered Jersey cows and to increase the production of the daughters of the cows of miscellaneous breeding. Past policies in managing the herd have always been decided upon the basis of what the good dairy farmer should do for the economical production of milk and butterfat.

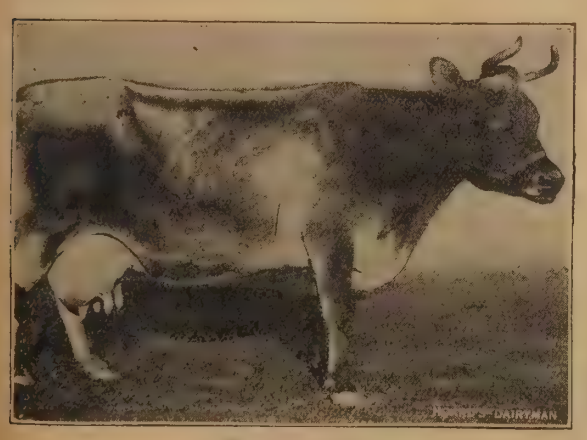
The Foundation Females

The two foundation cows were purchased as bred heifers in 1900 from a New York Jersey breeder at a cost of $250. They were considered a good bargain at that time and cattle were probably cheaper than at the present time. They were large, rugged animals that developed into good producers. Their pictures illustrated their type fairly well and it is evident from the photographs that they were not show animals. Millie Darling has an average of about 375 lbs. fat for each year of her lifetime and Dotshome Carey produced about 50 lbs. fat less per year.

All females in the herd at the present time, with the exception of one heifer, are descendants of these two cows. This became true in 1921 when the last two grades were sold. Twenty years to change the herd from 24 cows of irregular breeding and 2 registered females to 26 pure-bred cows may seem like a long, slow task to many, but it must not be forgotten that the use of pure-bred sires was profitable in the production of good grade cows as well as for increasing the size of the registered herd. In fact, the economy with which the present pure-bred herd was developed as a result of accepting slow, normal increases in numbers is one of the outstanding demonstrations furnished by the Station herd.

A study of the production records of the descendants of these two foundation cows shows little difference in their producing ability both in respect to quantity and quality of milk. However, there is a noticeable difference in the color of the progeny of these two foundation cows. The descendants of Dotshome Carey have a tendency to be light fawn in color, but most of the progeny of Millie Darling are very dark. For some reason that is not evident to the author, the descendants of Dotshome Carey are far more numerous than those of the other cow in spite of no greater ability in milk production.

It must not be inferred that the breeding ability of the females has not been a very important factor in the improvement of the herd. Certain cows have the ability to transmit good qualities in their offspring and such cows should be used for breeding purposes. This is just as true of cows as it is of bulls. The progeny of Carey of the Station illustrates this point remarkably well. Her best record was made at seven years of age when she produced 449 pounds. She had four daughters by three different bulls that have an average yearly production record of 518 pounds. Her granddaughters, five in number, have an average yearly production of 465 pounds. Her five great granddaughters produced 422 pounds and these records include a 2-year-old and a 3-year-old record. These records are either ten or twelve months in duration. Three of her two-year-old great granddaughters are now making records in excess of 300 pounds fat in ten months. It is self evident from this brief review of the progeny of Carey of the Station that she played no minor role in the development of the station herd.



Bulls Developed the Herd

The present herd is a product of the bulls used during the past 20 years rather than of the foundation cows. Of the twenty-two cows milking, ten are great granddaughters and nine are great great granddaughters of the two foundation cows. The other three are granddaughters and they, being past fourteen years of age, will soon be out of the herd. The present herd contains, therefore, approximately 10 per cent of the blood of the foundation cows with the exception of a few females that are slightly line bred to one of the foundation cows. The pedigrees of the majority of the heifer calves now in the barn will not contain the names of these two foundation cows but will be a composite of the pedigrees of the bulls. The importance of the bulls in the development of the herd is thus emphasized.

In recognition of the value of the sire considerable care has been used in his selection. Perhaps first consideration in the selection of a sire has been given to the selection of the breeder from whom he should be bought. Without exception the breeders who have sold bulls to the Experiment Station have been successful in developing their herd of Jerseys. They have been earnestly and honestly trying to breed better cattle and attempting to help others do the same. Their judgment in selecting a bull calf from a cow in their herd has been very helpful in obtaining a desirable bull. Furthermore, they were using carefully selected bulls in their own herds so that the sire of a bull calf need be given little consideration. In every instance the breeder's herd was seen at some time before a bull calf was needed. Personal acquaintance with the breeder and his herd were made possible by purchasing from New York State breeders. If the animals in the herd were the large American type Jersey and good producers, free from tuberculosis, a calf was purchased later by correspondence.

This method of purchasing bull calves when one to three months of age is, of course, open to objection because it fails to consider the type of the mature bull and his ability to sire good producing cows of desirable type. It must not be forgotten, however, that proven sires are very limited in numbers and command a price higher that the average dairyman can pay. The great bulk of pure-bred breeders as well as the av-

(Continued on page 69)

DOTSHOME CAREY

One of the first two pure-bred Jerseys in the Station herd that founded the herd. She produced an average of 325 lbs. fat per year. She was purchased as a bred heifer for $125.

MILLIE DARLING

All cows in the station herd are descendants of Millie Darling and Dotshome Carey. Millie produced an average of 375 lbs. fat per year.

MILK MARKETING IN NEW ENGLAND

ALEXANDER E. CANCE, Massachusetts Agricultural College

No one has sufficient knowledge or experience in the marketing of New England milk to sit down beforehand and work out a method of distributing New England milk and dairy products that will certainly be successful. The best any one can do is to proceed carefully and surely in eliminating wastes in the present marketing system and in building up better means and methods wherever possible.

Probably all practical market men and students of the matter will agree that marketing milk by individuals is not the most efficient method. All will agree that the milk producers should be organized. The success of the organized groups of dairymen, particularly creameries and milk distributing plants in cities, has shown the advantage of the co-operative over the individual plant unless the individual is a large producer or sells to a special market. The question is, what sort of organization should be formed.

As a general proposition it may be said that no organization, however perfect, can raise the price of fluid milk sold on a wholesale market much above the level of the price for the manufactured product. Since the manufactured product has a much wider market and a much wider range of competition, and since milk intended for manufacture may be turned readily into the whole milk market, it is inevitable that the price of whole milk can not differ very widely from the price of milk intended for manufacture.

In the next place, it is probably true that a very simple organization will within a short time effect a change for the better. The situation at the present time is extremely bad. So it was in 1916. A very simple organization by farmers with attention to a few of the major defects in marketing will improve conditions markedly within a short time. Indeed, it is probable that conditions will better themselves somewhat within a very few months.

Any plan for improving conditions should take into consideration the milk plants and creameries and other farmers' organizations that are now in operation. These organizations belong to the farmers. Many of them have gone through the first stages of difficulty and are now operating with considerable success. It would be most unfortunate if any form of organization should be attempted which would reduce the initiative and financial and moral responsibility which these groups of farmers have developed through the years. Probably the best that most of these organizations can offer is efficiency in assembling milk or in manufacturing it. Some of them also are merchandizing their milk or other products to good advantage. These local plants are particularly important because they are efficient producers giving careful attention to the supply of milk and the quality of the product they place on the market. In any plan they should be left free and responsible and should continue in the ownership of their properties.

The history of co-operation throughout the world shows beyond the possibility of a doubt that co-operation proceeds successfully in the majority of instances from community organized enterprises. This grows out of the peculiar nature of a co-operative company, which is a body of men who do their own business. A co-operative creamery is a body of men who supply their own milk, hire their own buttermaker, and manufacture their own product. A proprietary creamery, on the other hand, is probably a corporation owned by men who supply none of the raw material and who are interested in the manufacture of milk only for the profits there may be to those who have supplied the capital. As a consequence of this it is always important that the responsibility for a good product be laid as strongly as possible upon the shoulders of the co-operators. Ordinarily, co-operators in one community, understanding their needs and knowing one another, are able to bear this responsibility and to develop a loyalty to their organization better than co-operators who are scattered over a large territory and owe allegiance only to a distant central authority.

The history of the Dairymen's League in New York has shown that a number of plants which are owned by the central are inefficient. This inefficiency of the local plant must be borne by the entire organization. The responsibility for the inefficiency may be local but the local does not bear it. I do not know whether a plan can be worked out whereby inefficient plants owned by a central authority and managed locally can be made efficient or can be made to pay the penalty of their inefficiency. It is certain that independent plants, either individual or federated into a central group, can be made to bear their own burdens. The responsibility and the friendly rivalry which results from locally owned and operated plants is nearly essential to success in a competitive enterprise.

ROBERT W. ENO AND PENSHURST DAVID WITH WHICH HE WAS AWARDED GRAND CHAMPIONSHIP FOR THE BEST FITTED ENTRY AT THE SECOND ANNUAL STUDENTS' DAIRY CATTLE FITTING CONTEST AT PENNSYLVANIA COLLEGE

Another reason for the strength of federated community enterprises in dealing with a product such as milk, grows out of the fact that its marketing is exceedingly complicated. An organization which attempts to handle the milk and dairy products of a region like New England is likely to find it impossible to obtain a manager sufficiently alert and able to handle the entire process without considerable loss at some point. Under the most favorable conditions, profits are not great. If the management is not very efficient and able, the losses will be great enough to eat up all the advantage which the co-operative gives. The federated cheese factories of Wisconsin very soon learned this. They found that if the co-operative could give them three-fourths or even one-half a cent a pound more than they could receive through private agencies, the results were all they could expect.

Recently the American Farm Bureau Federation employed some of the ablest of our students of co-operation to study milk marketing organizations in the United States and Canada to determine the best methods of milk organization. The report has now been given to the public after a year's study and investigation by a number of experts. In brief, this report emphasized the need of organizing each of the dairy product groups separately; second, the procedure by the formation of community locals, and as the need appears, federating these into larger central groups; third, the affiliation or organization of all the milk commodity groups into one central overhead when conditions seem favorable; fourth, immediately, a sort of conference board which includes the leaders of the buttermaking, cheesemaking, condensery, and milk marketing groups with a view to studying common problems and making competition open and above board.

The state of Wisconsin has for some time been discussing the possibility of such an overhead organization as has been planned for New England. After this report was published delegates from the various dairy groups of farmers came together at Madison to determine whether it would be wiser to form a great central group or to proceed on the plan of federation of local groups. The question was decided almost unanimously in favor of the community group system federated into an overhead at the proper time. It is interesting here that in 1922 the same question arose in Wisconsin and was answered in the same way.

It is worth while at this point to point to the failure of some central organizations organized within a few years. The most notable of these, perhaps, is the failure of the Grain Growers' central organization which endeavored to organize the wheat industry by leasing farmers' elevators already organized, or by hiring them to handle wheat for the central organization, doing away entirely with the locally owned and locally responsible farmers' elevators. This organization has failed completely. A central organization was formed in Oregon a few years ago to handle milk and dairy products. This was almost exactly on the plan now proposed for New England. It has failed entirely, and the paper published by the association lays the blame to the fact that the organization was not built on locally owned plants. The failure of the Chicago Milk Producers, another central organization, is a third case in point.

The Dairymen's League of New York has often been pointed to as an organization worthy of imitation. This was organized a good many years ago and got in running order about 1916. As a matter of fact, the milk producers of New York are now in the throes of re-organization, and milk is selling in New York for about the same price that it is in New England. The Dairymen's League has found it impossible to take into its fold nearly all of the dairymen in New York. It has also found it impossible up to the present time to eliminate inefficient plants which the central has purchased and taken over. Whatever can be said of its success or of its failure, there is nothing in its history to prove that the organization of a central co-operative which does away with the individual plants and owns and operates them all from a central authority is going to be successful.

While it is not desirable to throttle a reasonable competition in the milk market, it is desirable to place competition on a fair and open basis. Among manufacturers the open price associations have brought about much more satisfactory conditions in the trade in many instances. It would seem to be a sensible move and one in the direction of economy, efficiency, and orderly marketing for the responsible heads of the various milk organizations in New England to come together periodically for purposes of discussing in a friendly way their marketing problems. An association or exchange of this kind should be formed without great difficulty and conducted without great expense. The questions of grading, of transportation, of methods of sale, of price trends, of efficiency in plant operation, of the possible elimination of wastes, of fair methods of competition, might well be discussed. Such an association might employ a statistical service for the purpose of gathering information concerning all the conditions of supply and demand, both in our own and in competing markets, giving out this information currently to all the co-operating bodies. This would educate the distributors as well as the farmers to the milk situation, and would bring to light a great many facts now hidden from the general public.

Such an organization as this might well be the point of departure for a larger central marketing organization, or for the development of more local co-operative associations if they seem desirable. There is no question that in a short time an association of this kind would stabilize conditions in the milk market to a very great extent. It is probable, too, that the final outcome would be a strong central marketing association. Such an organization has the advantage of being easily and cheaply formed and in a very short time. It has the advantage also of taking away nothing from the existing organizations, of giving due weight to all of them, as well as to any semi-organized groups of farmers who are selling their milk on the market. There is no reason why the unorganized milk producers might not come in through some delegated representative. It would be further advantageous in that no large and expensive plan of organization would be entered upon, and that all the possibilities had been fully thrashed out and all the terms made familiar to all the organizations already in existence. It would probably save hundreds of thousands of dollars in the expense of organizing a central association when the time seemed desirable. For the present this seems to be a reasonable and sensible method of procedure.

EVER FAILING OR NEVER FAILING PASTURE

Part 5.

Dairymen Answer Objections to Sweet Clover

WILBER J. FRASER, University of Illinois

It is the opinion of 81 dairymen that:

If cows are turned onto sweet clover when it is young, as they should be, there is no difficulty to get them to eat it after the first two or three days.

There is practically no trouble from bloat on sweet clover pasture if cows are full before being turned on, and once on, kept there night and day, and given access to a little dry roughage, salt, and water.

The same precautions prevent tainted milk.

THE three objections often mentioned in connection with sweet clover pasture are that the cows will not eat it readily, that it sometimes causes bloat, and that it occasionally taints the milk.

To get reliable and accurate information on the advantages and disadvantages of sweet clover pasture, we must get it direct from the men who have used it in the past and are using it at the present time.

No Trouble About Palatability

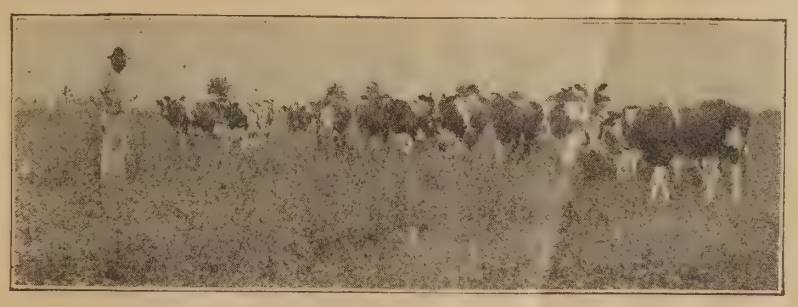
Some farmers seem to think that cows will not eat sweet clover. This is true if the clover has become tough and woody and the cows have an abundance of other good feed. But none of the 81 men who reported their experience in pasturing sweet clover last year, or the 32 men who reported the year before, had any trouble in getting their cows to eat it freely after the first three days.

Of course, everyone knows that cows like a variety of feed and will eat the three or four feet of bluegrass around the fence row tight to the ground before they make much impression on a sweet clover field. Maes Brothers in Jackson County, Illinois, after pasturing sweet clover that was to be plowed under for corn, turned their cattle onto a mixture of bluegrass and sweet clover in a large field when the sweet clover was from 18 inches to two feet high on May 22. I made a careful inspection of this field on May 27, and it was very evident that the cattle had eaten relatively more sweet clover than bluegrass.

Sweet clover pasture must be a palatable feed, for a large number of cows produced 40 lbs. of milk, and some cows produced from 55 to 75 lbs. of milk per day on it for a considerable time without grain or any other feed, as was reported in a number of cases by men answering the questionnaire. A cow has to eat a tremendous amount of it to produce this quantity of milk, which they would not do if the feed were unpalatable.

I have never seen anyone who put his cows on sweet clover pasture when the clover was young and tender who experienced any difficulty, after the first day or two, in getting his cows to eat it, and this trouble was incurred only the first year the cows were pastured on sweet clover. We are quoting more than 100 men when we combine the answers from this and last year's questionnaire and say that *there is no serious trouble in getting cows to eat sweet clover and use it to good effect in producing milk.*

Typical Bits of Evidence



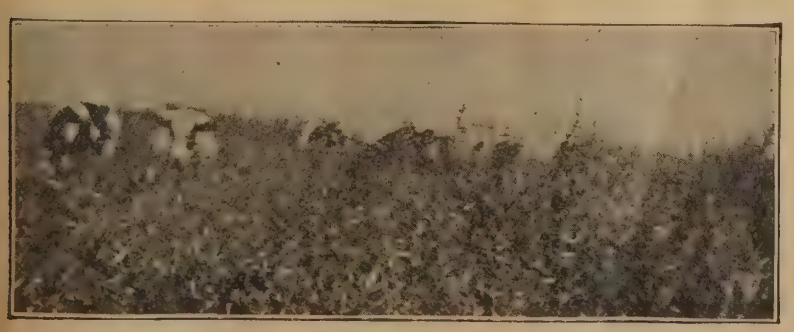
The following statements are interesting in this connection:

"I have a large pasture of bottom land that can not be tilled, but I sowed a small piece of sweet clover for night pasture and think it greatly helped the milk flow. After the cows became accustomed to the sweet clover pasture, they were always anxious to get to it when I brought them up from the bluegrass pasture."—Earl Henry, Northern Illinois.

"The cows had to learn to like sweet clover when first turned on, but it took only a few days."—H. K. Williamson, Central Illinois.

"The cows did not like sweet clover pasture at first, but after they started eating it, the milk flow immediately increased. I am sowing 17 acres this spring. My cows produced an average during the year of 9,100 lbs. of milk."—D. T. Smiley, Northern Illinois.

Thus is the palatability bugaboo disposed of.



JOHN MARKUS' DAIRY HERD ON SWEET CLOVER IN SOUTHERN ILLINOIS, MAY 29

These cows produced well on this pasture, receiving no other feed all summer, which shows sweet clover is palatable. To keep sweet clover pasture most palatable and have it produce the best, it should be stocked heavily enough to keep it eaten down to about the height pictured.

This is the third year that 150 head of United States Army horses have been pastured on sweet clover on this Central Illinois farm during June, July, and August, and have come off the pasture in fine flesh. It has been found that they stand the following year's work much better and keep in better spirit than when pastured on bluegrass, from which they had come in thin condition the previous two years.

A SWEET CLOVER PASTURE IN CENTRAL ILLINOIS, JULY 17

It was allowed to get too tall and unpalatable for the best results, yet these cows produced well on it all summer.

Easy to Avoid Taint in Milk

Out of the 81 men giving their experience in pasturing dairy cows on sweet clover, 68—or 85 per cent—said that it did not impart a bad flavor to the milk. The other 13 said it imparted a slight flavor at times, but this was usually when the cows were first turned on, and did not occur when a dry roughage such as straw or hay was available, although the cows ate very little of the dry roughage. In last year's questionnaire 30 out of the 32 farmers reported no trouble from off-flavored milk.

Tainted milk can be avoided by continuing to give the cows a little dry roughage to keep their bowels in good condition. This is especially important when cows are first turned onto sweet clover pasture. Many dairymen in Illinois who are pasturing their cows on sweet clover and are shipping milk to cities, have no objections raised because of a sweet clover flavor in the milk.

Six Out of Eighty-one Report Bloat

Out of the 81 men, the following six are the only ones making any definite statement of trouble from bloat. All the other 75 men answered "no" or its equivalent to the question—"Did you have any trouble with bloat?"

"I have little trouble from bloat. Cows should be first turned onto sweet clover pasture with full stomachs."—A. J. Yoder, Central Illinois.

"I have quite frequently had trouble from bloat."—Andrew Johnson, Northern Illinois.

"About four cows bloated. I had some second crop red clover in same field and had a great deal of wet weather."—George Ferry, Northern Illinois.

"I lost four cows in one year. I think clover is too rank, but if they can run to a straw stack, they do not bloat as readily."—George Nimmo, Central Illinois.

"I lost one heifer from bloat when I changed from the big dry clover in late summer onto the new stubble clover. This heifer ate too much because she was not full of other feed before being turned on."—W. K. Wilby, Northern Illinois.

"I turned one new cow on sweet clover pasture when she was hungry and had a slight case of bloat."—J. J. Kennedy, Northern Illinois.

Of the above six instances of bloat, two were caused by turning the cows on when hungry and when the clover was wet with dew. Two occurred where there was a large amount of red and alsike clover in the pasture, and it is well known that these have a tendency to cause bloat. In only two cases were cattle lost, and these were both on farms where dry straw was not available.

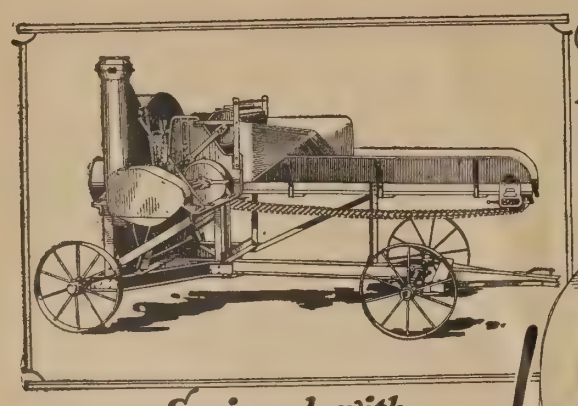
From this it is seen that practically all these cases of bloat were preventable if the ordinary precautions had been taken.

In the questionnaire sent out last year, of the 32 replies, 28 reported no trouble from bloat. With two, the trouble was but slight and two dairymen each lost one cow by bloat, but admitted it was their own fault because they turned the cows on when hungry and when the sweet clover was wet from dew.

Little Danger From Bloat

The following are statements from farmers who have had no trouble from bloat and what they say about how to prevent it.

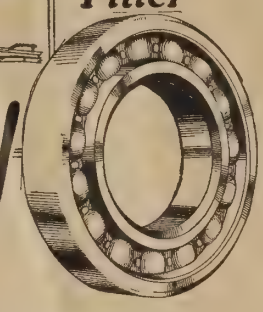
"You want to keep cows on pasture day and night, then you have no trouble with bloat."—Henry Kalmer, Southern Illinois.



"A load of straw drawn into the sweet clover pasture will be relished by the stock and will keep them from bloating. A good cure for bloat is to stand the cow in the hog chute or some place where her front feet are about two feet higher than the rear ones."—J. P. Walsh, Southern Illinois.

"I never heard of or saw any bloat from sweet clover. That is one of its good points."—Frank Easterly, Southern Illinois.

"I have had no trouble with bloat even when the sweet clover pasture was wet from rain or dew."—Edw. Schuetz, Northern Illinois.



I recently visited many dairymen who are pasturing sweet clover, in different parts of Illinois, and while bloat has been much more prevalent this spring than ever before, it was undoubtedly caused by frosted clover, as we had five frosts after May 10 in central Illinois, and it is well known that frosted sweet clover will cause bloat. When sweet clover has not been frosted, I have never heard of a case of bloat if the cows are kept continuously on sweet clover night and day, and are given access to dry roughage. Straw or corn stover are excellent feeds for this purpose and usually the best way is to haul a jag of straw into the sweet clover pasture as often as needed.

Thus we see that the three objections to sweet clover pasture which are commonly raised, come to naught when they are put to the actual test in good, intelligent dairy farm practice.

The Advance-Rumely Silo Filler

Equipped with BALL BEARINGS!

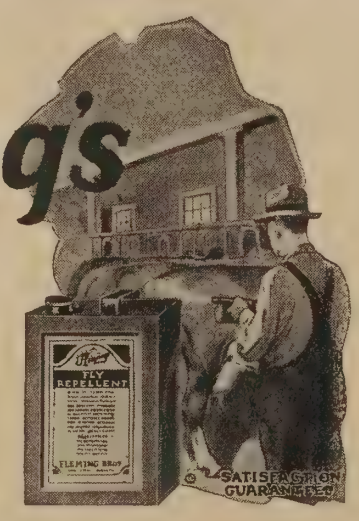
BECAUSE of the "Ball Bearing" flywheel on the Advance-Rumely Silo Filler, the keen knives and the shear plate always stay in adjustment. They cut clean and uniform like a new pair of shears and produce a high grade of silage.

Ball bearings stop both radial and end play. This allows the knives to be adjusted closer, cutting is easier and more uniform. The bearings are packed in grease; they wear indefinitely. This is typical of the entire Silo Filler, which is built to last. Steel frame, steel running gears, steel flywheel are a few of the features.

All adjustments are easily made. Gears run in oil. Standard equipment includes auxiliary feed roll—saves one man's time.

There are many advantages in owning this Silo Filler. You ought to know about all of them before you buy any other. Let us send you complete description. Write for catalog. Address Dept. AJ.

ADVANCE-RUMELY
Thresher Company, Inc., La Porte, Indiana
(Incorporated)



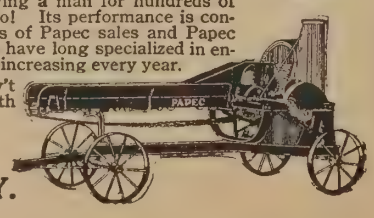
The Advance-Rumely line includes kerosene tractors, steam engines, grain and rice threshers, husker-shredders, alfalfa and clover hullers and motor trucks.

SERVICED THROUGH 33 BRANCHES AND WAREHOUSES

Use Fleming's FLY REPELLENT

For Better Results for Your Stock. Entirely Different from Ordinary Fly-Chasers. Pleasant to Use. Will not Stain or Blister. Lasting Action. The Flies will not Irritate Your Stock. *Because* Fleming's is Best and Guarantees Contented Cows

1 gal-$1.50 — 5 gal-$5.00 — 10 gal-$9.00
F.O.B. CHICAGO, NOT MAILABLE - SHIPPED EXPRESS OR FREIGHT
FLEMING BROS. 194 UNION STOCK YARDS CHICAGO
"27 Years at the Stock Yards"



PAPEC
The Cutter for Profit

To get the most profit out of your silo, fill it with the simplest, strongest and most economical Cutter made.

Throws And Blows — Saves One Man

The Papec's few parts and correct design reduce draft and lengthen life. Equipped with positive self-feed that is saving a man for hundreds of farmers. The Papec never clogs on any silo! Its performance is continuous. That one fact has made thousands of Papec sales and Papec boosters. The Papec is built by people who have long specialized in ensilage cutter construction. And the output is increasing every year.

Write today for our new Catalog and U.S. Gov't Bulletin "Making and Feeding of Silage." Both free to silo owners.

PAPEC MACHINE COMPANY
116 Main St. Shortsville, N. Y.

Plan for Organizing New England Milk Producers

WHEN it became desirable to reorganize the New England Milk Producers' Association, a committee was selected to formulate a plan. Two plans were presented by members of the committee, one providing for pooling all the milk produced in the New England States and the other to build local institutions and then federate them. The majority of the Committee voted for the pooling plan and those favoring it are now attempting to put it into operation. Hon. E. S. Brigham, Commissioner of Agriculture of Vermont, outlined the federation plan and it is as follows:

Each community having a sufficient number of dairy cows (500 or more) should form a local co-operative corporation for the purpose of erecting or purchasing a plant adequate to receive, process, and manufacture the dairy products of the community.

The plant, if located sufficiently near the railroad to make milk shipping possible, should be equipped with facilities for handling fluid milk for shipment to market and with facilities for manufacturing milk into one or more by-products. If the plant is located a great distance from the railroad, manufacturing facilities only need to be provided.

The local co-operative corporation should be financed by sale of stock to the dairy farmers of the community who agree to deliver the product of their dairies for a stated length of time. The stock should be in proportion to the number of cows owned by the patron and may be issued on the stock rotating plan.

The local co-operative corporation should be managed by a duly elected board of directors chosen from members of the local organization, who should have authority to employ a manager for the plant and other employees and to carry on the general business of the plant as outlined by the by-laws adopted.

When a sufficient number of local co-operative corporations have been organized and are operating plants, the next step should be to form a federation of such plants, delegating the federation such functions and such authority in the management of the local plants as may be agreed upon.

The federation should be organized as a co-operative corporation, having each local plant as a member and should have a board of directors and other officers as provided by law.

The federation should employ a general manager who should be the chief officer and who should have, subject to the approval of the federation board of directors, the right to exercise the authority delegated to the federation by its contracts with member local co-operative corporations.

This authority should include the following:

(a). The employment of an inspection force to inspect milk and cream at the plants and to visit farms contributing product of inferior quality, with a view to making improvement. These inspectors should have the right to reject milk or cream which did not come up to a certain standard agreed upon.

(b). The employment of trained specialists in the processing of market milk and in the manufacture of all kinds of dairy products, whose services should be available to the managers of the local plants and to whom such managers should render reports, so that all milk should be handled in such a way that a uniformly high quality of milk and other products should be offered in the market.

(c). The provision of storage facilities so that products like cheese could be held and cured under suitable conditions until ready for market, and where products resulting from seasonal surplus could be held and released when the market would take them.

(d). The establishment of a selling agency in city markets as necessity developed. A sales force should be employed to make sales and see that customers have service. A laboratory should be established to make butterfat and quality tests. Facilities for carrying necessary stocks to meet the demand of customers should be provided.

(e). The establishment of a purchasing agency through which local member plants could purchase all supplies. An effort should be made to standardize supplies and equipment and thereby simplify the problem of stocking repairs and supplies likely to be needed on short notice.

(f). The establishment of an accounting service which should provide member plants with an adequate method of bookkeeping and with supervising accountants.

(g). The advertising of the products offered for sale by the federation.

The current expenses of the federation should be met by an assessment made upon each dollar's worth of product handled through it.

Property purchase should be made by stock issues subscribed for by members plants.

The contract of the federation with member plants should provide for the manufacture and sale of the entire output of such member plants in such form and manner as the general manager of the federation should direct. The receipts of such sales should be prorated to member plants on the basis of amount of product contributed, subject to such equalizations for difference in cost of transportation, quality of product, cost of manufacture of different products, and allowances for seasonal variation in production as a board of equalization composed of a representative from each contracting member plant and the board of directors of the federation should agree upon.

Seasonal surpluses should be cared for insofar as possible by withdrawing from milk shipping plants least advantageously located and the manufacturing of the entire output of such plants.

The aim of the federation should be the production and manufacture of the finest quality dairy products in the most efficient manner possible, the feeding of such products into the markets as they are needed, and the creation of demand by service, advertising, and satisfactory goods.

The existence of a market price, determined by supply and demand, which is a necessity as a regulator of the amount of production required to supply demand, existent or potential, would be recognized.

Any dairy community would be admitted to the federation if it qualified by erecting a suitable local plant and became a member of the federation.

Due to essential changes, the article entitled, "The New England Dairy System, Inc.", will be found on the following page instead of this page as is stated in an editorial.

New England Dairy System, Inc.

THE majority of the Committee selected to work out a marketing plan for the New England dairy farmers proposes the centralized form of organization. The object and intent of this association shall be to promote and encourage better and more economical methods of production and to minimize extravagance, speculation, and waste in the manufacture and sale of milk, cream, butter, cheese, and other dairy products and by-products and to engage in the intelligent and orderly handling, grading, marketing, manufacturing, storing, and advertising of dairy products and by-products.

We present an outline of the proposed contract which will be offered to the milk producers in New England to sign and in so doing we give in substance an outline of the centralized plan of organization. The copy of the contract which we have was agreed to some weeks ago by the committee selected to formulate a plan to reorganize the milk producers in New England. It is quite possible some minor changes have been made by the committee since that time, but the outline which follows gives in the main the proposed form of the centralized organization.

The New England Dairy System agrees to buy and the member agrees to sell and deliver to the System all milk and cream owned and controlled by him for a period of five years from the date of signing the contract. The dairy products of the member will be delivered at such points as the System may designate.

The member expressly warrants that he has not heretofore contracted to sell milk to any firm or person.

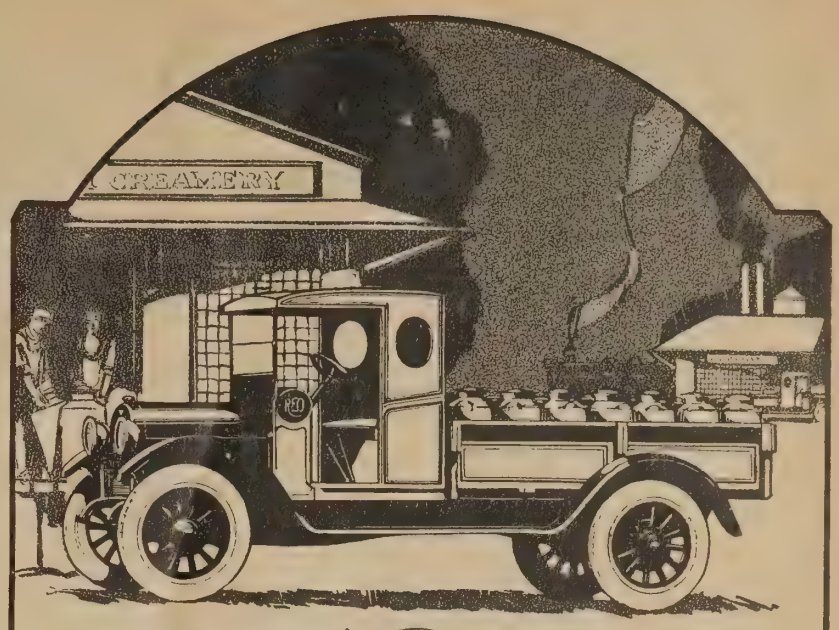
The member agrees that his milk shall be produced, kept, and delivered under sanitary conditions and be in conformity with the requirements of the local Board of Health.

The System shall have the right to reject any milk or other dairy products not conforming to the System standard. The System shall also have the right at any time to inspect the cows, stables, milk houses, and other equipment for the production, storage, or shipment of milk by the members.

It will be the duty of the System to resell the milk purchased from its members and at prices which in the judgment of the Board of Directors of the System would yield the members the highest return.

The money received for milk, cream, and other dairy products shall be mingled in one fund and from the total receipts the Board of Directors shall pay the cost of handling and all other costs for conducting the business which the System operates, including dividends on Class "B" stock at a rate not to exceed 6 per cent per annum and the setting aside of an amount as a reserve fund. After all legitimate expenses have been paid, the balance shall be distributed to each member in such manner that each one shall receive the same basic price per unit of milk. The Board of Directors shall determine the basic price, differentials in quality, cost of transportation, etc.

The contract provides that the member will purchase Class "B" stock in the System to an amount not exceeding 5% of the purchase price of his dairy products sold to the system; and for this purpose the member expressly authorized the System to withhold this amount monthly from his milk check.



The member agrees that he will endeavor to follow the suggestions of the System as to the proportionate quantities of milk produced during the several months of the year. The purpose of this is to provide an adequate supply of milk for the consumer at all seasons of the year.

Should the member fail to sell and deliver his dairy products to the System in accordance with the agreement made, he agrees to pay the sum of 50 cents per cwt. of milk to the System. The member further agrees that in the event of a breach or threatened breach by him of any of the provisions relating to the delivery of milk or other dairy products, the System shall be entitled to an injunction to prevent breach. If the System finds it necessary to bring any action whatsoever by reason of the breach or threatened breach, the member agrees to pay the System all costs of court, costs for bonding, and otherwise.

The contract shall run for a period of five years and continuously thereafter unless cancelled by notice by either party between the first and fifteenth day of November both inclusive of any year. The notice must be made in writing and will become effective on the following first of March.

The contract will not become effective until a definite number of cows have been signed. We are unable to state definitely what percentage of the cows must be signed before the contract becomes effective. It is generally held that about 70 per cent of the cows would have to be signed to make the contract legal. The number of cows in each one of the New England States is to be determined by the Commissioner of Agriculture in each state. The copy of the contract in our hands provides that if the required number of cows are not signed, those signing may send representatives to a meeting for the purpose of determining whether the organization should go forward. Opportunity is given for those desiring to withdraw, to do so.

SPEED WAGON

Economy for Every Phase of Farm Transportation

Just as surely as profits must be saved as well as earned, the SPEED WAGON on the farm is an economy which leads to larger bank balances at the close of the year.

No matter what your transportation needs may be, the SPEED WAGON supplies them at the lowest cost. Hauling a capacity load to the markets or returning empty, the SPEED WAGON operates at a cost that is actually a saving.

* * * * *

Twelve standard bodies emphasize the SPEED WAGON'S suitability to every form of rural transportation.

Dependability, length of life, and the accessibility of moving parts assure the continuous service most vital on the farm.

* * * * *

And while payment of the purchase price is followed by practically a total freedom from additional expenditures, the first cost is almost unbelievably low.

Capacity, 500 to 2500 pounds. Chassis, $1185 at Lansing, plus tax. Designed and manufactured in the big Reo shops,—not assembled.

REO MOTOR CAR COMPANY. Lansing, Michigan

Leaky Roofs

Made Water-tight for 10 Years at ⅕ the Cost of a New Roof

SEAL-TITE spreads over any kind of old roofing. Not a paint. Amazingly simple way to waterproof and preserve old leaky roofs. Easily applied. No heating. Free tools. Guaranteed 10 years.

Don't Pay for 4 Months!

Seal-Tite must do what we claim or it costs you nothing. Cover your entire roof. Then let 4 months' sun and rain prove our claims. Send for full details of this exceptional offer.

Monarch Paint Co., Dept. C-285 Cleveland, Ohio

HUDSON

ANIMAL POKE

Keeps the Cows In— SAVES THE FENCE

Strong, light, comfortable. Made of steel, rounded edges; heavy enough to correct the most unruly animal. Rowel-wheel acts quickly and effectively. This poke can't chafe the neck nor bother the animal. Long forks; extra strong hinges. Adjusted without tools. See it at your HOME-TOWN HUDSON DEALER or write us.

HUDSON MFG. CO.
Dept. 4415 Minneapolis, Minn.

CORN HARVESTER cuts and piles on harvester or windrows. Man and horse cuts and shocks equal Corn Binder. Sold in every state. Only $25 with bundle tying attachment. Testimonials and catalog FREE showing picture of Harvester. PROCESS MFG. CO., Salina, Kan.

Jensen Adjustable Chain Halter

For unruly bulls, vicious stallions. Presses on tender parts of the head, across the nose and jaw. Releases itself as animal gives up. World's safest bull die for staking around yard, protecting human life. Price $4.50, shipped prepaid where no dealer. Ad runs once a month only.

Holds Em All

P. W. JENSEN & SON, Princeton, Dept. H, Minnesota.

EDITORIAL COMMENT

A DAIRY farmer recently discovered he was running his hand separator backwards and it was losing $2.50 worth of fat per month per cow. If he had not been a member of a cow testing association, no telling how long he would have sustained this loss.

A FARM laborer sent us a very commendable letter setting forth his idea of the relationship between the farm owner and the hired man. It came to us unsigned and, since it is our policy not to publish communications of this character, we have filed it. This article is so full of human interest and presents the side of the hired man so clearly and well, that we would like to publish it in Hoard's Dairyman and will do so if the writer will send us his name. We do not desire it for the purpose of publishing it in connection with his communication. We are willing to sign it "A Worker" or anything else, but we must have the names and addresses of those who prepare communications for us.

NEW ENGLAND MILK SITUATION

The New England Milk Producers' Association, organized eight or ten years ago, has rendered the milk producers of New England a good service and has done much to stabilize the milk market and milk prices. This association handled a large volume of milk and for several years was successful in securing very attractive prices for its product. The price of liquid milk in Boston became so high that during the past year a chain store system with over 300 retail stores began to handle milk from local co-operative milk producers' organizations. This was sold over the counter in these stores on a cash and carry basis for from two to four cents per quart under the price which the regular dealers charged for milk purchased from the New England Milk Producers' Association and delivered at the house. A number of creameries began to put their milk on the market because they found it more profitable to dispose of it in this way than to manufacture it into butter and utilize the skimmilk for growing pigs and calves. These outside co-operatives selling milk at a lower price than asked by the N. E. M. P. A., soon brought about a condition which caused the price of liquid milk to decline and the association was no longer able to obtain much more than butterfat prices for its milk.

A meeting of the leading dairy repesentatives of New England was called and a committee of fifteen was selected to provide plans for reorganizing the milk producers in the New England States. The committee brought forth two plans, namely, the federated and the centralized plans, the latter being favored by the majority of the committee.

The centralized plan provides that all local plants are owned and operated by the organization as a whole. Each producer contracts to deliver his milk to this organization for five years. The producer has no direct and personal interest in his local plant. The investment he makes in the property of the organization covers all its property, and there is little opportunity left to capitalize local enthusiasm, loyalty, and ability. Managers of the local plants are responsible only to the central organization and not to the producers delivering milk to the local plant. An abstract of the proposed contract for the centralized plan will be found on page 54.

Another plan was offered by E. S. Brigham, Commissioner of Agriculture of Vermont, and on the same page we publish this plan. We also publish an article entitled "Milk Marketing in New England" by Alexander E. Cance of the Massachusetts Agricultural College, which discusses marketing milk in New England, the purpose of co-operative marketing, and the form in which it may be organized that it will most likely succeed.

It seems to us, as we have studied the milk situation in New England, as well as in the entire United States, that it would be better for the creameries and other local institutions processing milk to form federations rather than to merge themselves into one organization covering all New England.

When the N. E. M. P. A. was organized it was the conviction of some that the better form of organization was to establish local institutions and then federate them. It was held then, as now, that this method would take too long and the milk situation needed immediate help. Eight or ten years have passed, with the producers in the same situation as they were before the N. E. M. P. A. was organized.

Whether the dairy organization is formed upon the local unit or the centralized plan depends finally upon the producers. They will give the several plans proposed careful study if it is their desire to have a part in co-operation and learn what co-operation means and what it will or will not do.

We believe the weight of evidence is that to be most successful the producer should have an interest in and direct his own local co-operative plant. From this follows naturally and inevitably the federation of these several plants for the purpose of the more efficient handling, processing, and marketing of milk. Each unit is then directed and owned by the producers who supply it with milk. They will profit by good management and the production of high quality product. They will not share the profit or the loss of some other unit more efficient or less efficient, as the case may be.

GRADE COWS AT NATIONAL

The good grade cow is to be given special recognition at the National Dairy Exposition in Milwaukee this fall. Grade cows of known production will compete in the show ring for liberal prizes and there will be a sale of high producing grade cows of a magnitude heretofore unknown. In addition there will be some splendid exhibits showing the results of testing cows for economical production.

The competitive classes for each of the five dairy breeds will be as follows:

Class 1. Cows with cow testing association records of 350 lbs. fat or over.

Class 2. Cows under four years old, August 1, 1924, with cow testing association records of 250 lbs. fat or over.

Class 3. Heifers bred to a pure-bred bull and from dams eligible to above classes.

Class 4. Group of 5 cows from a single association, eligible to Classes 1 and 2.

Class 5. Group of 4 cows, eligible to first two classes, sired by one registered bull.

Class 6. Dairy herd of 5 cows, eligible to first two classes, owned by one exhibitor.

Class 7. State herd of 10 cows eligible to first two classes—prizes to be prorated to owners.

Class 8. Champion grade cow of each breed.

For classes 1 to 6 there are ten prizes, ranging from $10 to $30 each. For class 7 there are three prizes, ranging from $50 to $150. A special circular and entry blanks may be secured free by writing W. E. Skinner, National Dairy Association, Milwaukee, Wisconsin.

The grade cow sale will be under the experienced management of C. L. Hill, Wm. Baird, and Glen Vergeront. Animals eligible to the first three classes described above may be entered for a sale. These cows may also compete in the show classes if the owner so desires. Entry blanks and conditions of sale may be secured by writing C. L. Hill, Rosendale, Wisconsin. Great interest has already been manifested in the sale and the management insists that it shall be a sale of quality and satisfaction.

The emphasis placed on cow testing association work at this year's National suggests the following as a slogan:

FEWER AND BETTER COWS
BUTCHER THE BOARDER

TOWNSHIP SOIL SCHOOLS

The soil is the foundation of agriculture and indirectly the foundation of the nation. No people can become strong and resourceful upon an impoverished soil. It must be productive, capable of supplying the population of a nation with adequate food and material from which our clothes are made. One of the fundamental questions of this country is how to keep our soil productive, how to build a permanent system of agriculture.

Plants, like animals, feed. They require nourishment. Every time a crop is removed from the land, a definite amount of fertility is carried away. The good farmer makes a study of the elements which he must replace in his soil in order to keep it productive and to have it yield a sufficient quantity of crops to make them profitable to grow.

In Sauk County, Wisconsin, there is being carried on what may be termed township soil schools. It is the plan to hold a school one day in every township in that county where a complete program for soil improvement will be given. This work is under the direct charge of Griffith Richards of the Wisconsin College of Agriculture. Farmers are taking a deep interest in these schools; as many as seventy-five have been in attendance at one township soil meeting. The object of these schools is to advise the farmers of the value and purpose of the soil survey that is being made in that county and to discuss plans for soil improvement. This is substantial help to the farmers in this community, for it gives them specific information regarding the treatment of their soils, whether they need limestone and what kind of fertilizer should be purchased in order to supply that in which the soil may be lacking. Much fertilizer, as well as effort and money, are wasted in not having definite knowledge of the soil's needs. These schools provide just the knowledge the farmer requires in order to treat his soil wisely.

MILK CONSUMPTION INCREASES

Those who have been concerned about the effect of tuberculosis eradication on the consumption of dairy products should be reassured by the figures recently issued by the U S. Department of Agriculture.

"During the years 1918 to 1923, inclusive, tuberculous cattle killed in the United States increased progressively from 6,544 to 107,321; approximately 95 per cent of tuberculous cattle killed are dairy cows. During the same years the total number of dairy cows in the United States increased by 1,127,000 head, and annual milk consumption per capita showed an increase from 172 quarts to 212 quarts."

It may be concluded that the wide discussion on tuberculosis eradication and the necessity of establishing clean herds has had no detrimental effect on the consumption of dairy products. It is our opinion that tuberculin testing and the eradication of reacting animals lead the consumer to have a greater confidence in dairy products. Of course we must not forget the educational forces in this country that are teaching the consumer the food value and importance of milk. Moreover, the danger of transmitting bovine tuberculosis, especially to adults, is so small as to make it a negligible consideration. The consumer appreciates that tuberculin testing produces better quality products and well informed farmers know they are the ones bearing the expense of tuberculosis. Here we have a happy combination working for good results.

We have found in our many years of experience that seldom does an individual or an industry suffer because it takes the right course. There is something in the human heart that is always in favor of doing right.

Estimating Production

What can we expect from heifers that average 40 lbs. milk a day?

Redtop, Minn. J. M. L.

It is rather difficult to estimate the yearly production of cows where record is had for a few days only. In a general way, we would ordinarily expect that the cows that average 35 to 40 lbs. daily for their best month's production will have an annual production of from 7,500 to 8,500 lbs. milk. If their daily average is from 40 to 45 lbs., they may be expected to produce 8,500 to 9,700 lbs. in a year. There will, of course, be many variations from this with individual cows. It is generally estimated that a heifer will produce, as a two-year-old, approximately 70 per cent of what may be expected from her as a mature cow.

Cost of Producing Crops

A summary of 11,238 reports from farmers all over the country issued by the U. S. Department of Agriculture on the 1923 crop of corn shows an average cost of $0.68 per bushel; the average cost of producing wheat on 7,852 farms was $1.24 per bushel, and the average cost of producing oats on 8,481 farms was $0.52 per bushel. In the cost figures are included charges for labor of the farmer and his family, and a charge for the use of the land on a cash rental basis; so that if the cost just equaled the price, the farmer was paid for his time and his investment.

The average gross cost of producing an acre of corn amounted to $26.40; with a credit of $2.65 for stover the net cost of production was $23.75 per acre or $0.68 per bushel for a yield of 35 bushels per acre. Fifty-three per cent of the total cost was for the work of preparing the seed bed, planting, cultivating, harvesting, and marketing; fertilizer and manure amounted to 15 per cent, seed 2 per cent, land rent 22 per cent, and miscellaneous items such as twine, crop insurance, use of implements, use of storage buildings, and a charge for general farm overhead expense amounted to 8 per cent.

The average sales value of the corn was $0.81 per bushel; this leaves a margin of $0.13 per bushel or $3.41 per acre above the cost, after charging for all expenses, including family and operator labor and use of land.

A summary of the 8,481 reports on the cost of producing oats showed an average gross cost per acre of $20.23, a credit of $2.15 for straw, and a net cost of $18.08 per acre. The average yield was 35 bushels per acre, making an average net cost per bushel of $0.52. The distribution of the costs was as follows: man and horse labor for preparing seed bed, planting, harvesting, threshing, and marketing 49 per cent, fertilizer and manure 7 per cent, seed 7 per cent, land rent 26 per cent, and 11 per cent for sacks, twine, crop insurance, use of implements and storage buildings, and general overhead.

The average sales value per bushel was $0.49, or $0.03 per bushel and $1.70 per acre less than the cost. This would cover all expenses except land rent, including the value of the labor of the farmer and his family and would leave enough margin to take care of 67 per cent of the cash rent reported, or pay 4 per cent on the average investment in land.

Killing Johnson Grass

HOARD'S DAIRYMAN:—About ten years ago the University of Arizona purchased an experiment station in the Salt River Valley near Phoenix. This farm was one solid mat of Johnson grass. The entire 160 acres were divided into 8 different fields. Each of these was handled in a different manner in an eradication of Johnson grass experiment. At the present time there is very little Johnson grass on this farm, though it is still a proposition of continually keeping at it in order to prevent the grass from coming back.

Perhaps the best method which was used in eradication of the Johnson grass at this station was by pasturing with sheep. In pasturing Johnson grass with sheep, in an attempt to eradicate it, one should use more sheep than the pasture can support. In an irrigation country we also find it an excellent practice to keep the Johnson grass well watered so as to force as much top growth as possible. The excess number of sheep per acre enables one to keep this top growth down at all times, thus starving out the root systems of the grass. After such a procedure has been run for three or four months during the growing season, the Johnson grass has been so stunted that it is a comparatively easy matter to kill off a few remaining shoots. It is then necessary to plow up the pasture and keep it in some crops such as small grains or Sudan grass if it can be planted early enough in the season to attain much growth.

Plowing the Johnson grass patch dry and keeping its roots exposed to the influence of our hot Arizona sun has also proven successful. Thorough cultivation with an alfalfa renovator every few weeks to stir up the soil, to keep it well dried out, to rake the Johnson grass roots out on top, has proven to be a good practice. Keeping a Johnson grass patch well plowed and well stirred up during the summer time, and then irrigating and planting immediately to wheat or barley, is about as good a method as one can use in the Southwest if sheep are not available.

The whole secret is to keep down all top growth and thus prevent the manufacture of plant food necessary for the keeping alive of the root systems. R. S. HAWKINS.

Arizona College of Agriculture.

Dairy Cattle Costs in North Dakota

On the majority of North Dakota tenant farms the owner of the land does not share the ownership of such cows as may be milked, however a constantly increasing number of landlords are encouraging their tenants to keep live stock and are furnishing all or part of the milk cows. The accompanying table gives an approximation of the annual cost of maintaining a dairy cow and the distribution of costs between landlord and tenant when on a half share basis under representative North Dakota farm conditions where an interest is taken in dairy cows:

Annual Cost of Maintaining a Dairy Cow in North Dakota and Division of Expense Between Landlord and Tenant

	Total	Landlord's expense	Tenant's expense
Feed: Grain, 866 lbs. at 5-6c	$ 7.20	$ 3.60	$ 3.60
Roughage, 4843 lbs. at ½c	16.14	8.07	8.07
Silage, 2993 lbs. at ¼c	7.48	3.74	3.74
Pasture, 3 A. at $2.00	6.00	6.00	
Man labor, 160 hrs. at 25c	40.00		40.00
Horse labor, 17 hrs. at .09c	1.53		1.53
Cow cost: dep., int., taxes, ins., and miscellaneous	12.10	11.74	.36
Sire	4.00	2.00	2.00
Buildings	6.95	6.95	
Machinery and equipment	3.52		3.52
Management	6.18	3.09	3.09
Total	$111.10	$45.19	$65.91

It will be noted that the tenant bears considerably more than one-half of the cost of maintaining the cows. The division of expenses tends to be unfavorable to the tenant because of the large amount of man labor required by dairy cows. Some farm owners in well established dairy communities contribute toward the labor costs when they are able to procure efficient dairymen as tenants.

Adjustment of returns from dairy cows in proportion to the expense borne by landlord and tenant can be easily made. For example, on the basis of the figures given, the tenant should receive 60 per cent of the returns and the landlord 40 per cent.

Under the commonly used half-share arrangement landlord and tenant would divide the feed costs equally, except pasture, which would be furnished by the landlord. The tenant would furnish all the labor, machinery, and equipment, and would provide feed for the work horses, except pasture. The landlord would furnish the sire and assume all cow charges except miscellaneous items, such as veterinary fees, which would be divided equally. It is assumed that the cost of maintaining the sire is borne equally by the two parties.

It is well to note that of the annual cost of $111.10 for the maintenance of a milk cow, $47.71 consists of a charge for man and horse labor. For the majority of North Dakota farmers with a small number of milk cows, labor on dairy cows does not indicate additional cost, but use of labor that would otherwise be unused, and to this extent represents net returns. Furthermore, on many farms roughage and pasture used for cow feed would otherwise be unmarketable. In calculating the returns from dairy cattle the value of the calves, skimmilk, and manure should be considered, in addition to sale of butter or butterfat. The cows on which the data are based averaged 4,849 lbs. of milk, or 205.6 lbs. of butterfat. The value of the calf at birth was placed at $5.00 and the value of the manure at $20.00 annually.

Since dairy cows require so much man labor it is fair for the owner to supply all of the cows, as well as the dairy bull. When the owner has a very well bred dairy herd he may not wish to divide up the offspring. In this case a clause may be inserted in the lease providing that when heifers are taken into the herd or when the lease is terminated, the tenant will be paid one-half the value of these animals jointly owned. The owner usually retains the right to purchase the tenant's share whenever the latter wishes to sell.—A. H. BENTON in North Dakota Bulletin 171.

The Soy Bean Tariff

Under the caption "Soya Beans in the United States in the Year 1923", the organ of the soap, paint, and oleomargarine industry attempts to convey the impression that the only use of soya beans in this country is as a forage and soil improvement crop; that soya beans are not grown with any thought of their being used for oil production; that the production of soya bean oil from home grown seed is declining and the amount insignificant. This publication says that this amount is "hardly to be found in the records of the tremendous domestic production of oils and fats in the United States" and that the prohibitive tariff against importations of foreign soya bean oil has deprived the domestic industry of "a most valuable raw material without compensating benefit to anyone"; and calls the idea of developing a domestic soya bean oil industry a "thoroughly commercial one".

The fact that up to the present soya beans have been grown primarily for forage and soil improvement, is evidence of its importance for these purposes. It is also true that up to within the past two years soya beans have been grown with little thought of producing seed for oil, but it is not true that the value of soya beans to the farmer is confined to their use for forage and soil improvement, neither is it true that during the past two years no thought has been given to producing soya beans for oil. Both of these statements are untrue as shown by the fact that more than three quarters of a million pounds of soya bean oil was produced from home grown seed in 1922, and nearly one and one-half million pounds in 1923.

The claim is made that the amount of soya bean oil produced is insignificant as compared with the total production of oils and fats in the United States.

Wouldn't it be just as reasonable to tell Farmer Jones that because his crop is so small as compared to the whole crop production of the United States, it isn't worth his while to grow anything on his farm?

Next comes the amazing statement that the "prohibitive tariff against importations of foreign soya bean oil has deprived a domestic industry (paint and varnish) of a most valuable raw material without compensating benefit to anyone".

The author of the above statement has just finished telling us of the insignificance of the whole soya bean oil business, then turns around and says that the tariff has deprived a domestic industry of a valuable raw product (oil), a raw product that the farmers of this country should be producing and which they have hitherto not been able to produce because of these very importations of which he writes.

He winds up by saying "the idea of developing a domestic soya bean oil industry is a thoroughly chimerical one".

According to Webster "chimerical" means "fanciful, whimsical, etc". But, is the increased farm value of soya beans in the United States from over $6,000,000 in 1921 to nearly $14,000,000 in 1923, fanciful?

Is the production of over 2,500,000 lbs. of soya bean oil since the tariff went into effect, fanciful?

Is the opportunity of supplying the 337 million pounds of soya bean oil which has been imported in a single year, and may be again, fanciful?

If the idea of developing a soya bean industry is fanciful, and is as insignificant as these interests would have us believe, why are they having nightmares over it? Why do the users of soya bean oil go to the expense of maintaining offices in Washington, and paying experts to manipulate facts and figures to discourage the farmer's efforts?

They don't want him to grow beans for oil because they will then be compelled to buy home produced soya bean oil at fair American prices.

Great need for soya bean oil in this country caused more than 40 million pounds to be imported in 1923 in spite of the tariff. As our farmers adjust their operations to meet the new conditions his oil can and will be made here and the importance of foreign soya beans and soya bean oil will gradually disappear.—D. A. BRODIE.

Coming Events

Sept. 14-20—Eastern States Exposition at Springfield, Mass.
Sept. 27-Oct. 4—National Dairy Show, Milwaukee, Wis.
Sept. 22-28—Dairy Cattle Congress, Waterloo, Iowa.
Oct. 21-23—Wisconsin Buttermakers' Asso. meets at Chippewa Falls, Wis.
Nov. 1-8—Pacific International Live Stock Exposition, Portland, Ore.

Another 1,000-lb. Fat Producer.

The latest cow to have her name enrolled on the Holstein honor list of 1,000-lb. fat producers is Dutchland Creamelle Cornucopia, bred and owned by the F. F. Field Holstein Trustees of Massachusetts. As a 5-year-old, she produced in one year 27,690.8 lbs. of milk containing 1,027.33 lbs. butterfat (1,284.16 lbs. butter.)

Uncle Ab says: While it's better to be right than successful, it's also comforting to know that success generally follows the man who is right.

Washington, D. C., Weekly News

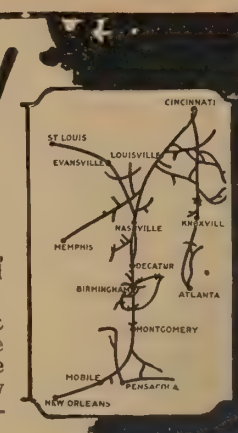
[Special to Hoard's Dairyman.]

WASHINGTON, D. C., JULY 22—Special preparations are being made this year, as usual, for the participation of the United States Department of Agriculture in the National Dairy Exposition in Milwaukee. This participation will be threefold, the personal assistance of the Department experts of both the Dairy Bureau and the marketing force of the Bureau of Agricultural Economics, the special work of the Dairy Laboratory, and the big display exhibits to be built and shown by the Office of Exhibits.

I have just had a preliminary look into the plans for the 1924 exhibit, and it should be said that both in the general plan and in the details to be worked out it will be a superior exhibit to any of those previously made.

⚜

Reports continue to roll into Washington as to the trouble with the corn crop this year. One of the latest and most alarming has to do with the fact that the large requirements for seed the past spring, made larger than usual by large replantings, has drawn seed reserves to a very low point, so that the present bad outlook indicating that there may be a poor yield and very poor seed produced this year will make the situation as to seed very alarming in the coming season of 1925. This, if these reports are to be credited, will carry over the short corn crop through next year and will make for an exceedingly high price for reliable seed the coming spring. All this has a definite reaction on the dairy industry, as also does the high price and short crop of wheat, and the reports of a big falling off in Canadian wheat production. It all points to these factors coming in to slacken up the rapid expansion of the dairy industry, through increasing dairy costs this fall and winter, and through indicating greater profits in cereals and hog and beef production.



⚜

The Internal Revenue Bureau and the solicitor of the Treasury Department are still trying to unravel the snarl caused by the recent Supreme Court decision invalidating the 16 per cent ruling as a definition of adulterated butter. Until some determination of policy, collectors and agents are largely at a standstill in enforcing the law and it is understood that quantities of high moisture butter are appearing on the markets. Of course, if this is in interstate trade, the 80 per cent butterfat standard applies, but when in intra-state trade, that is, not shipped over a state line into another state, it is not subject to this butterfat law.

⚜

The official announcement of an investigation of the tariff on butter was issued by the U. S. Tariff Commission this past week. The cost of producing butter in this country and in Denmark are the points to be ascertained. The applicants for this investigation hope to show by these figures that the cost is higher in the United States by more than the margin of eight cents covered by the present tariff law, in which case the law will automatically bring about an increase. It is said that President Coolidge is anxious for an early determination of the facts. One important question to be determined is whether or not this butter investigation will cover also an investigation and determination of the cost of producing milk and cream in the two countries.

A Heritage for your FAMILY!

Working as hard as you do—located as you are, how much can you hope to leave your wife and children when you die?

In the North and East, farm values have about reached their peak, while in the South values are steadily increasing; but you can still buy fine farm lands in the South at comparatively low prices, and the increase in values alone will provide a real heritage for your children.

In the South the climate, the all-the-year crop-growing and crop-marketing season, the fine farm and grazing lands to be had at low prices and on easy-payment terms, the cheap and plentiful farm labor—all go to make for profitable farming, dairying, or cattle raising.

The L. & N. Railroad wants to show farmers, stockraisers and dairymen how they can come South and prosper—live better, enjoy more of the good things of life, and be able to leave a greater heritage to their families.

Every electrical convenience is yours to command

The minute you install a Kohler Automatic Power and Light Plant, the door is opened to all the labor-saving conveniences which city people have.

Washing and ironing, pumping water, cream separating, and a score of other chores can be done quickly, easily, and economically by this remarkable electric plant. And all the while you have bright, safe light for all your buildings.

The no-storage-battery plant

One of the big reasons why Kohler Automatic owners get so much out of electricity is that this plant does away with the need for storage batteries. There is merely a small *starting* battery, similar to the one on your automobile.

The Kohler Automatic's current flows without waste direct from the generator to the job. Full rated capacity is always on tap. Appliances can be switched on any time and used for any length of time, without the bother of visiting the plant and without risk of damage from occasional overload.

110-volt current, too

The Kohler Automatic generates 110-volt current—regular "city" electricity. It operates standard appliances. You can carry its current long distances and have electricity everywhere at your service.

Automatic operation provides the same kind of press-the-button convenience that city homes enjoy. Fine workmanship and the use of the finest materials insure exceptional reliability, plus surprising economy in gasoline and oil consumption and in general operating cost.

$435 buys a Kohler Automatic

The splendid 800-watt Kohler Automatic, the ideal plant for average needs, offers you all these proved advantages at an economy price—$435, f. o. b. factory, complete with starting battery and 55-gallon gasoline storage tank.

A remarkably interesting 48-page booklet, profusely illustrated, contains full information about this and other Kohler units. Send for this booklet—learn why users are so enthusiastic over Kohler Automatic efficiency and economy. The coupon opposite will bring it to you.

Lay roofs that don't talk back

What does that mean? It means roofs that don't rot or rust—roofs that don't need painting or patching—roofs that don't catch fire from flying sparks. It means Barrett Roofings.

Once you lay Barrett Roofings you'll hear no more complaints from the house tops. And that means no more worry about leaks—no more digging down in your pocket for upkeep expense. Sixty-six years of experience have taught The Barrett Company how to make roofs that *don't talk back*.

For Your House — A roof of Barrett Shingles gives lasting weather-tight protection—adds beauty and color. Their weather-surface is everlasting mineral in pleasing soft shades. And these rugged shingles are highly fire-resistant. Flying sparks or burning embers burn out harmlessly on their surface. This is important to people who live far from a fire department.

For Barns, Sheds, Etc.—there is Barrett Mineral-Surfaced Roofing, the most attractive roll roofing made. It, too, is fire-resisting—surfaced with unfading mineral in the same pleasing colors. If you don't want color in the roofs of your barns there is Barrett Smooth-Surfaced Roll Roofing—tough, durable, inexpensive, easy to lay.

Call on the Barrett dealer nearest you. Ask to see Barrett Roofings. (Leading lumber, building supply and hardware merchants carry them.) There's a Barrett Roofing that is 100% right for any building on your farm.

Barrett ROOFINGS

Your Choice of Six Styles

Everlastic Smooth-Surfaced Roofing
A roll roofing of best grade roofing felt, saturated with high grade waterproofing material. Made in medium and heavy weights. Tough, pliable, elastic, durable, low in price, and easy to lay.

Everlastic Mineral-Surfaced Roofing
A beautiful and enduring roll roofing. Mineral-surfaced in red, green, or blue-black. Popular for cottages, garages, farm buildings.

Everlastic Giant Shingles
Handsome enough for the expensive home, economical enough for small farm house or cottage. Mineral-surfaced in beautiful shades of red, green, or blue-black, with extra-thick, extra-rigid base. Size 8" x 12¾".

Everlastic Single Shingles
Identical in shape with Giant Shingles but not quite as heavy. Mineral-surfaced in same beautiful colors. Need no painting, are fire-resisting.

Everlastic Multi-Shingles
Four shingles to a strip. Mineral-surfaced in red, green, or blue-black. Two sizes—10 or 12⅔ inches deep, both 32 inches long, providing two or three-ply roof when laid 4 inches to weather.

Everlastic Octagonal Strip Shingles
The newest mineral-surfaced strip shingle. Colors: red, green, or blue-black. Can be laid in novel designs by interchanging red strips with green, or red strips with blue-black.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Caught On Third Bounce

HOARD'S DAIRYMAN:—Mr. Ward's brick struck before it got here but I caught it on the third bounce and I am handing it back. As a teacher of political economy, Mr. Ward deserves a leather medal with a hole in it. I don't believe Mr. Ward would be able to recognize political economy if he found it in his barn tied up with the cows. I think the trouble with Mr. Ward is that he has been reading open shop propaganda until that noodle on top of his shoulders has got to spinning around until the machinery has jarred loose and he has his thinking apparatus operating in reverse gear.

If Mr. Ward had one of those old union cards lying around he would have a very much better understanding of the organized labor movement and would not be so easily influenced by the open shop propaganda and he would be better able to discuss the question, but he is as near right on this question as he is on the others. He says there is no such thing as overproduction and calls it underconsumption and his remedy to increase consumption is to cut the workingman's wages and decrease his purchasing power as a means of increasing consumption. He pictures a stone wall with flour on one side and hungry workers on the other and offers as a remedy for this situation the importation of more workers to take a few more jobs away from these hungry workers. He says that when 90 per cent of the wealth of this country goes to 10 per cent of the people, this nation will fall.

I don't know anything about his well digging senator, but if Mr. Ward does not approve of him I am taking it for granted that he is a pretty good man. He says he can see nothing in common between the farmer and the working man and what is their gain is the farmer's loss and he is as near right on this question as he is on the others. The fact of the matter is, that the working man is the farmer's best customer and farmers are the working man's best customers. When there is any amount of unemployment the farmer is the first to feel the effects and when the farmers are no longer able to buy the working man's products unemployment follows, so what is to the interest of one is to the interest of both.

Mr. Ward says that a farm can not be operated on an 8-hour basis, but if the force of habit has got so strong that he has to get up at four o'clock in the morning to milk his cows there would be no law to compel him to change his time of getting up at that hour and there would be no law to prevent him from going fishing after he had worked eight hours or even before he had worked his eight hours and he could get back to milk his cows at four in the evening and finish his eight-hour day. It is true that he would not be able to keep as many cows as he does but he would get a better money return for what he did produce. If we did so there would be no surplus to glut the market. I live in the pea growing section and the spring has been cold and wet and a great many peas have rotted in the ground but, as one neighbor says, a half crop will bring more money than a full crop so what is the use of crying and what is the use of producing a full crop if we can get more money for a half crop. What is the use of working 16 hours a day if we can get more money for an 8-hour day? This method of each competing with the other and each trying to produce more than his neighbor is not getting us our share of the money, so why should we continue to do so? I am willing to let the politicians and economists go hang. The government and no force on earth can help us as long as we compete with one another, both in production and marketing, and as long as we produce more than we can sell at a profit. And no one as yet has come forward with a better plan to cut down the production more equitably than by cutting down the number of hours that we work.

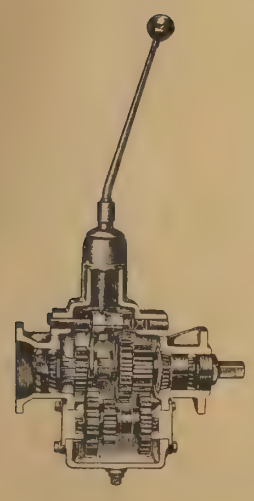
New York. A. H. KLEIN.

Feed for Dairy Cows

HOARD'S DAIRYMAN:—Here is a list which I believe would be very good feed for dairy cows: corn silage, unsalable potatoes, and unsalable fruit. I once thought carrots a very good feed for cows, but government experimental work now seems to think beets preferable. Ground corn and ground oats would also be a good thing to feed, and lental and oat straw mixed with molasses.

There are several things, including waste from mills and factories, that are put in sacks and placed on the market, and it might not be a bad idea to buy this material if the milk producing elements in the same are large enough for a profit.

I do not think it much use to feed hay in the winter time, for most of the hay in Western Oregon and Washington is so coarse that cattle will not eat a tenth of it. If the same ground were used for pasture it would be far more profitable.



I believe that only about one man in a hundred cuts his hay early enough for cattle to eat every blade of the same. If the first hay was cut in May, and the best time would be immediately after a long rain when there would be assurance of several days of good weather, a second crop of hay might be cut in July. The result would be two good crops of early cut hay. But they never do that way in the far west. When the cost of harvesting hay is considered, I think that there is much more profit to let a band of dairy cows have the field. This would greatly enrich the soil. Most farmers wait until late in July, when the hay has grown very tall and coarse, and most of the field flattened down by some heavy rain. When cut with a mower, several inches will be found on the ground and looking quite as coarse as chickery.

It would be easy to make considerable money with a large band of very good dairy cows, if nothing on the farm was ever disturbed. But where anyone is living in a vicinity where people are strongly opposed to them it is not much use; the loss will be greater than the profit. And this sad result has been realized in California.

Washington. C. P. GREELY.

A recent survey of bankers of a neighboring county shows a number of missing and cracked buttons on their vests, caused by leaning over the counter at the cashier's window looking to see if there was any milk on the shoes of the fellows who were trying to borrow money. Sh-h.—Exchange.

A. H. MATTHEISZ, Proprietor
746 EAST FORT AVENUE
BALTIMORE, MD.

April. 2, 1924.

Auto Accessory Assn' Inc.
1101-03 Cathedral St,
City.

Gentlemen;-

Please send me at once another Warford Transmission for Ford Truck. We are going to use this Transmission on an old Ford that we have re-built, which we are anxious to get into service.

Owing to the fact that by installing your Transmissions in my Ford Trucks and gaining such great satisfaction from same, I feel it is my duty to write your firm. I have never had one minute of trouble with any of your Transmission in the two years of service that I have used them. Since installing Warford's we have increased our loads and now carry an average of 53 Ten Gallon cans of milk per trip, total weight including cans about 3100 pounds. I find that I save fifty percent on time which alone pays for the Transmission in one week of steady operation, as we make two trips where we formerly made one, and also get 20 miles to the gallon of gasoline instead of 11 miles our former regular Ford Truck mileage.

I must say if you quit making these Transmissions, I will limit my purchase of Ford Trucks to exactly what I have on hand, because, this Transmission of yours is the very heart of the Truck and the only economical thing that makes it possible to operate Ford Trucks in my line of business, furthermore, if anyone wishes to know more about your Transmissions from me, I will gladly demonstrate or communicate with them.

Sincerely yours
August A Mattheisz
Pres & Mgr.

Warford would be a worthwhile investment if it gave you nothing more than a two-ton Ford truck —but Warford gives you a speed truck too.

To Mr. Mattheisz the speed-wagon swiftness of the Warford equipped Ford means even more than its two-ton capacity. Warford speed gives him two trips where he made but one before, writing off Warford cost in a single week.

Mr. Mattheisz' experience, 20 miles to the gallon with Warford, 11 miles without, makes the Warford claim, "two-ton performance at Ford one-ton cost" more than modest.

This much you can bank on—with Warford equipped Ford trucks your hauling costs will be less. Ask your Ford dealer or write us today.

AUXILIARY TRANSMISSION

The Warford Corporation 44 Whitehall Street, New York City

WHAT DOES IT PROVE—

when, on a single farm in one year, five cows average 1248 lbs. butter, four of the five average 1261 lbs., two of the five average over 1300 lbs., and one, Anna Lenox DeKol 2nd, makes a world's record for 12-year-olds, all breeds, with 28,646.3 lbs. milk, 1367.58 lbs. butter?

40% Protein

That's exactly what happened at Yates Farms, Orchard Park, N. Y.,—all these great records being completed since last December.

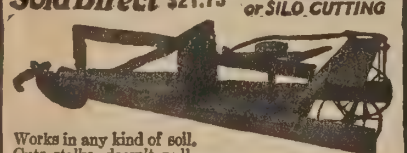
Chiefly, it proves two things—that these are good cows and that they're well fed. At Yates Farms liberal amounts of

DIAMOND CORN GLUTEN MEAL

are fed all year 'round.

Mr. F. M. Nichols, Herd Manager at Yates Farms, wrote: "I consider Diamond Corn Gluten Meal one of the most essential feeds for any dairy ration."

Mr. Nichols does not believe in ruining a cow for the sake of a great record. These animals were fed for big production without sacrifice of health.



Ask us for a ration card and get your dealer to mix up a DIAMOND ration. A month's trial will convince you that DIAMOND deserves its place in

DAIRY MARKET NEWS

Cheese Markets

(Report from U. S. Dept. of Agriculture)

Cheese markets were firm particularly at country shipping points during week ending July 19th. Current inquiry was in excess of immediate supplies. Into storage movement continues. Production is holding up well but the peak has passed. Hot weather defects are beginning to appear.

The average wholesale prices on American cheese, style Twins, for the week ending July 19, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending July 19 1924	July 12 1924	July 19 1923
	Cts.	Cts.	Cts.
New York	20.7	20.7	25.5
Chicago	17.7	17.9	21.8
Boston	21.4	21.6	25.2
San Francisco	20.5	21.1	23.3
Wisconsin Board	17.6	17.4	21.7

The receipts of cheese at these markets were 5,623,703 lbs. for the week as compared with 6,339,925 lbs. last week and 5,805,122 lbs. a year ago.

Twin City June Milk

The Twin City Milk Producers' Association paid its members $1.85 a hundred for 3.5% milk f. o. b. Twin Cities. The production for June set a new record, with the association handling over 25 million pounds of milk. The association paid 45 cents a pound for butterfat in sweet cream, which is two cents above the price paid a year ago and 3½ cents above New York extras.

NEW YORK, July 29—Butter, quiet; receipts, 3,680 lbs.; creamery, extras, 38@38¼c; special market, 38½@39¼c.

Eggs—Quiet; receipts, 10,092 dozens; nearby brown and mixed, 37@44c.

FOND DU LAC, Wis., July 26—Average cheese prices (majority of sales), f. o. b. shipping point: Flats, 18c; Twins, 17¾c; Single Daisies, 18½c; Double Daisies, 18c; Young Americas, 18¾c; Longhorns, 18½c; square prints, 19c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange July 26: Single Daisies, 17½c. On Farmers' Call Board July 26: Twins, 16¾c; Young Americas, 17½c; Longhorns, 17½c; square prints, 17¾c.

MILWAUKEE, July 26—Butter, creamery, extra, tubs, 36c; standards, 35½c; extra firsts, tubs, 34@35c; firsts, 32@33c; seconds, 30@31c.

Eggs—Fresh gathered firsts (new cases), including cases, candled, 26½@27c; ordinary firsts (standard cases), 25½@26c; miscellaneous lots, shippers' cases returned, candled, 22½@23½c; seconds, dirties, 20@21c; checks, 20@21c.

Cheese—American full cream, Twins, 18@18½c; Young Americas, 18½@19c; Longhorns, 19@19½c; Daisies, single, 18½@19c; American, 33c; Pimento, 34c; Swiss, 42c; special market brick, fancy, 15½@16c; Limburger, new, 19@20c; imported Swiss, loaf, 44@48c.

CHICAGO, July 28—Butter—Receipts, 20,793 lbs. Extras, 36c; standards, 35½c; dairy, firsts, 34½c; seconds, 32@33c.

Eggs—Receipts, 23,885 dozens. Ordinary, 25½@26c; firsts, 26½@27½c.

Cheese—Twins, 18c; Young Americas, 19c.

Butter Markets

(Report from U. S. Dept. of Agriculture)

Butter markets continued nervous and unsettled during the week ending July 19. Sentiment in the markets mixed, but there was sufficient support to prevent sharp declines, despite release of monthly cold storage report during week which revealed more than an 11,000,000-lb. surplus over a year previous. Heavy production continues. Import situation unchanged and of little consequence.

The average wholesale prices on 92-score butter for the week ending July 19, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending July 19 1924	July 12 1924	July 19 1923
	Cts.	Cts.	Cts.
New York	40.8	41.0	38.5
Chicago	38.3	39.0	37.4
Philadelphia	41.5	41.6	39.5
Boston	40.5	41.4	39.0
San Francisco	41.1	39.1	41.5

The receipts of butter at these markets were 21,481,947 lbs. for the week as compared with 23,749,345 lbs. for last week and 17,528,159 lbs. a year ago.

Variation in Test

HOARD'S DAIRYMAN:—Articles similar to the one by Mr. G. R. Rice will go a long way towards convincing the many dairymen who belong to cow testing associations that the tests given monthly by the tester on milk and cream will not necessarily correspond with the tests given by dairies and creameries.

Experience as an official tester has demonstrated clearly to me that cows will vary day from day ever under normal conditions and if a herd happens to be up in test the day the cow tester is testing then the test for the month would be accordingly high. Occasionally the test proves a good average for the month but this is more or less of an accident. I am inclined to think that the tester who made the statement that 90 per cent of the difference in fat test is the fault of the farmer, spoke at random.

I have samples of milk given to me to test by men who have been shut off from shipping, presumably for having low testing milk.

Although for courtesy's sake I am obliged to test these samples, I feel it is sometimes the cause of unnecessary argument between producer and buyer. In some instances I have found that samples given to me were actually taken from the top of a can of milk after it had set for an hour after milking. Samples of this type will invariably test abnormally high, which demonstrates the necessity of mixing milk thoroughly before sampling.

I agree with Mr. Rice that the procedure of taking a composite sample before tester comes is the only reliable way to get a correct idea as to what the milk being shipped tests.

Porter County, Ind. H. L. G.

Will Cut Your Bacteria Count

Indiana State Holstein Sale

At the Indiana State Holstein Sale held June 26, at Crown Point, 51 head were sold, 7 males and 44 females at an average price of $156.60, a total of $7,986. The twelve-month-old bull calf, Veeman Matador Prospect, consigned by Joe H. Hill Company and bought by Lyman Conquest of Indiana for $315, topped the sale. The top price for a female was paid by C. W. Newman, Indiana, for a five-year-old cow, Alfaknolls Calilac Creamelle, consigned by Herman C. Homfeld, a straight type cow heavy in calf by the forty-pound bull, Winterthur Sadie Vale Dosegis.

The outstanding fact that buyers were willing to pay good prices for type and condition but not for records and production makes me ask the question, "Are we on the right track to make money out of dairying?" While the prices were low for the quality of the animals sold, considering the slow demand and the low price for milk and the poor prospect for a corn crop, the consignors are very well satisfied.

The settlements this year were a decided improvement over the state sale held last year at South Bend when we received 20 per cent in cash and 80 per cent in notes—some of them slow notes at that. This year we received 82 per cent in cash and 18 per cent in notes.—C. W. NEWMAN, President The Indiana Holstein-Friesian Ass'n.

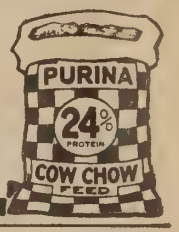
Cattle Plague Subsides

The suppression of foot and mouth disease in California has assumed a condition of watchful waiting, the United States Department of Agriculture announced in a statement issued July 21. No new infection had appeared within five days before that time but the state and federal veterinarians are making inspections constantly and are ready to cope with any new flare-up that may occur. The last two cases of foot and mouth disease occurred among cattle in Tuolumne County which is a rough, mountainous region. The diseased cattle were killed promptly and others running on the same range—and therefore exposed—are rapidly being gathered up by range riders for slaughter.

U. S. Exhibit at Dairy Cattle Congress

Chief among the many educational exhibits which will be made at the Fifteenth Annual Dairy Cattle Congress September 22 to 28, Waterloo, Iowa, will be the extensive one made by the Bureau of Dairying, United States Department of Agriculture. Joseph W. Hincox, exhibit specialist of the Department of Agriculture, advises that the construction of the exhibit is completed and that it is one of the most attractive and educational that his department has produced.

The exhibit is grouped in units and treats the following subjects: Better Dairy Cattle; Cow Testing Associations; Dairy Cattle Breeding; Live Stock Improvements; Feeding Dairy Cows; Cost of Milk Production; Diseases of Dairy Cattle; Milk for Children; Clean Milk; Butter Inspection Service; Marketing Organizations; and Package Standardization.—Dairy Cattle Congress.



How sweet and gracious, e'en in common speech,
Is that fine sense which men call Courtesy!
Wholesome as air and genial as the light,
Welcome in every clime as breath of flowers,
It transmutes aliens into trusting friends,
And gives its owner passport round the globe.
—JAMES T. FIELDS.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Thousand Club Members Enjoy College Hospitality

Coming by auto, train, bus, and even by bicycle, one thousand and one New York Juniors and their leaders invaded the agricultural campus, Cornell University at Ithaca, for three glorious days, June 25-26-27. The attendance broke all former records, nearly doubling that of last year.

The first afternoon was spent sightseeing followed by a campfire supper in one of the gorges which crosses the Cornell campus. Around 30 fires the thousand youthful guests of the College, with their leaders, were given a "real feed". Weiners were roasted over the fires and were accompanied on the menu by rolls, cabbage salad, cocoa, cookies, ice cream, and oranges. When all were filled, a huge campfire was lighted and the whole gathering assembled to listen to the splendid address of welcome by Dean A. R. Mann, who spoke on the fifth H in club work—Habits.

Subject Matter Demonstrations

Thursday forenoon the college teachers gave subject matter demonstrations for the boys and girls. Divided into six groups the boys received instruction in gardening, potato and corn growing, poultry raising, rope splicing and knots, dairy cattle judging, and the judging of sheep and swine. Girls learned about canning and about food selection from the home economics specialists. At noon they were given opportunity to practice what they had learned about the latter topic in the home economics cafeteria. Each girl selected her luncheon in the regular manner and then her tray was scored by competent persons using the regular food-selection score card. After lunch a half hour was spent in listening to the huge pipe organ in Bailey Hall.

A PART OF THE GAY CROWD OF CLUB MEMBERS AND LEADERS WHO ATTENDED NEW YORK'S JUNIOR FIELD DAYS

Under the direction of Daniel Chase, State Supervisor of Physical Education, the afternoon's athletic program started off with a parade about the athletic field. Each county group had its banner and outdid itself to make a real showing. Then followed a track meet of fourteen events, for girls and boys. Every event was filled to the limit with contestants and not a protest was heard regarding any of the decisions, many of which were very close and hard to decide on account of the great number competing. Livingston County, with its delegation of 12 girls and 21 boys, won the trophy banner for the track meet with a total of 18 points.

A baseball tournament occupied the remainder of the afternoon. Preliminary contests narrowed the competition down to teams from Onondaga and Wyoming Counties. The final game was played amidst great excitement and was compelled to run extra innings before Onondaga was able to take the lead and win with a 5 to 4 score. One of the rules of the tournament was that each team should have at least two girls as members. Several spectacular plays were carried through by the fairer members of the various teams. Onondaga County won the trophy banner awarded to the winner of the ball tournament.

Candle Service

One of the most impressive parts of the whole two-day program was the candle-lighting ceremony which was conducted by Rufus Stanley, leader of the boys' and girls' work in Chemung County, together with the young folks from that county. Following a much enjoyed program of rhymes by Professor "Bob" Adams, all assembled, county groups together, on the main quadrangle of the university around a central "achievement shrine", lighted by four huge candles, representing the four H's of club achievement. All were provided with candles. With suitable solemn ceremonial each county group sent up a boy and a girl to bring back to them the light of achievement which they gave to each member of the group.

With candles all lighted and everyone standing the "Achievement Light" song by Mr. Stanley was sung and, candles upraised, all repeated the following pledge, "Desiring to follow our motto, 'make the best better', I pledge my head, my heart, my hands and my health to worthy achievement in my home, my county, my state, and my nation." This ceremony proved a most fitting close to the days' activities.

On Friday morning, subject matter demonstrations were continued. The official program closed at noon.

New York. PAUL R. YOUNG.

Attention, Juniors!

How many of you Hoard's Dairyman Juniors are planning to attend your state fair? There are many good times in store for you at these events. If you are now planning to go to the state fair, won't you sit down right away and report this fact to the Junior Editor by writing to him? At the coming state fairs there should be some good old reunions of Hoard's Dairyman Juniors. Let's go!

A County Club Newspaper

"The Clubwork Forward" is the name of a little 4-H club newspaper which has recently made its appearance in Kenosha County, Wis. This bulletin is issued monthly, mimeographed on yellow paper in the county agent's office, and sent to all club members and interested people for the meager price of 12 cents a year, just enough to cover the postage. "The Clubwork Forward" is a regular little magazine, has reporters in each local club, carries news items, has an editorial page, and a department for each project operating in the county. Articles for these departments each month are written by the county leaders and project advisers.

And who do you suppose is the editor of this splendid club house organ? None other than our good friend G. B. Price, Jr., still a very much active club member, state poultry champion for two years, and just elected secretary of the Wisconsin 4-H Club Short Course Association. George is doing a splendid piece of work with his "Clubwork Forward" and we congratulate him most heartily. He is setting a fine example for the rest of us to follow. While there may be many 4-H club papers, and other counties may have their house organs, we have not heard of one where the editor, publisher, subscription manager, and advertising manager are all combined in one person, and that person an active club member who carries this responsibility in addition to his projects and other duties. George is a Hoard's Dairyman Junior.

Thoughtful Thaddeus Says

I heard some good advice the other day from a poultry specialist. He was talking about how to get rid of the mites which are so troublesome to poultry. He said that you could get rid of the mites very successfully by painting the roosts and dropping boards with the oil drained from an automobile. Just simply take a good brush and smear it on, being sure to get it into the cracks.

A Florida Junior Dairyman

"Hard luck" said friends in 1920, when 10-year-old Edward Mitchell of Dade County, Florida, picked a sorry looking heifer from the twenty offered for calf club boys. Edward, now 14, has turned his hard luck into $1,000 of clear profit and the Blue Ribbon Jersey Junior herd of four cows and a young bull.

Edward's first obligation was to pay $150 for his calf club cow, "Genie", through the bank. Edward says, "My cow came fresh about four months after I got her and I sold her heifer calf to Dad for $50. She milked 9,000 pounds that first year. I bought feed of Dad at 3½c a pound and sold milk to him at 7c a pound. I met all my payments at the bank and had some left over that first year."

Edward then invested $175 in a calf club cow and $60 in each of her twin calves. At the next show he won first for best calf club herd, a distinction which he has won in every show since then. Genie took third in the Jersey class. The glory was short lived, however, for the cow and her twin calves caught an infection and died shortly afterwards.

Edward kept Genie's second heifer and she milked 46 pounds in one day in two milkings. Unexpected expense descended on Edward then for his little sister's calf club cow died and Edward agreed to take her calf and pay for the loss of the cow to the extent of $200.

When Fairy, the calf, freshened, Edward kept her daughter. Fairy's milk offset the feed for Genie and Fairy and their two heifers, and Genie's production was spelling profit until a rattlesnake bit her. Edward spent several hours bathing the wound and finally saved the cow after five days of serious sickness.

"GENIE" WAS THE FOUNDATION HEIFER OF EDWARD'S JUNIOR HERD

The pinnacle of Edward's achievement was at the 1922 county fair, when Genie was awarded grand champion over all breeds for aged cow, and she and her daughter were grand champion over all breeds for cow and calf at the fair. He paid for his exhibit with over $100 of prize money. The following year he secured no new stock and in the 1923 fair, Genie was grand champion of her breed. Genie had a bull calf in May 1923 and Edward is raising him to head his herd.

Edward's records are a simple two column chart of each cow showing feed and pounds of milk twice a day. When production is fairly stable he does not always keep a chart. He is now using feed mixed by his father and a bucket of beet pulp with each seven pounds of feed. With Genie nearly dry, he is feeding her four pounds, consisting of 100 parts ground oats, 100 corn meal, 100 wheat bran, and 50 linseed meal.

In May, Edward's milk check was $490 for his three cows. He milks 10 or 12 cows morning and night and helps with general farm work when not in school and says his Dad pays him $1 a day for labor and gives him board and clothes. He has completed his freshman year in the nearest high school, but he and his father plan to buy a car so he can attend the Dade County Agricultural High School about 25 miles away. He anticipates taking his cows to college to pay his expenses.

Florida. E. BISBEE.

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

Are you troubled with weeds on your farm? How can you get rid of them? In "The Modern Parable of Weeds", in the July 25th issue of Hoard's Dairyman, S. R. Winters has given a few successful methods now being used in the fight against these intruders.

What is a "noxious" weed? The dictionary says that noxious means harmful. A noxious weed may choke out field crops, or it may poison live stock.

Name nine noxious weeds. Morning glory, Canada thistle, sow thistle, dodder, quack grass, garlic, snake root, wild turnip, and wild radish.

Give two methods of fighting Canada thistle. In Rock County, Minnesota, alfalfa is used as a smother crop. After pulverizing the soil thoroughly the alfalfa is sown in early summer. The second season of growth reveals the presence of only a few thistles. The third season generally shows a total absence of this pest. One of the methods used in destroying Canada thistles in Lyon County, Iowa, is to plow the thistle land in early spring and cultivate it throughout the growing season. A cultivated crop is planted the next year.

Tell how Monterey County, California, is fighting morning glory. The most satisfactory results have been obtained by digging holes 18 inches deep and 3 feet apart in the soil and filling each hole with four ounces of carbon bisulphide.

How are weeds being killed in Idaho? Sodium arsenate ("Ussco weed-killer") used in the proportion of 1 part Ussco to 50 parts water is killing dodder completely when applied in the early stages of growth. Two, three, and four applications of sodium arsenate are used to eradicate Canada thistles, and morning glory has been killed by this same treatment to a depth of 24 inches.

How much sweet clover pasture is necessary for one cow for six months? Reports received from 81 farmers in Illinois show that an average of three-fourths of an acre per cow is sufficient sweet clover pasture for six months. (See article "Ever Failing or Never Failing Pasture" by Wilber J. Fraser.)

How should sweet clover pasture be managed to secure the best results? Seed perennial white clover each year in the small grain. In the spring turn the cattle into the second year's crop. About the middle or last of August turn the cows into the new clover in the stubble, using this until the latter part of October. Thus the six months' pasture is partly from new and partly from old clover.

What are the advantages of sweet clover pasture? Because it is deep-rooted, sweet clover stays green and fresh throughout the dry, hot weather when bluegrass pastures burn up. Sweet clover is good milk feed. Cows maintain high milk production while on this kind of pasture.

Junior Letters

Giving Good Care to Calf

Hoard's Dairyman Juniors:—I received your letter today and will answer it before I forget about it.

My calf is a Jersey heifer. When I started in the club work she was exactly 3½ months old. The heifer was from one of my father's cows and I chose her because she looked the best to me. She was of good dairy type and had the best udder development of any of the calves. Her mother was not much for type but was a good eater and producer.

When I began feeding the heifer named Lady I fed her 6 lbs. of milk a feed, and one pound of ground corn and bran mixed. I kept this up for about 3 months and then stopped feeding her milk and fed her about 4 lbs. of bran and ground barley mixed. I fed her up to the time of the fair and then stopped because we could not afford it, much to my regret. I fed her 2 times a day. I didn't take any extra care of her only I brushed her once a day and then about 3 weeks before the fair I put a blanket on her and kept it there for about a week and then she thought she had worn it long enough and I couldn't keep it on her so I brushed her three times a day.

There is nothing better for a farm boy or girl, or any one for that matter than to be in a club and doing club work. If all the boys and girls on the farm belonged to a club, in a few years there would be more ambitious people in the world called farmers to feed the city folks.

Colorado. Leonard Norris.

Mother Does the Chores!

Mother cooks and does the baking,
Mother does the chores;
Mother does the garment making,
Mother does the chores.
Washes, mends, and does the dishes,
Never spends her time on wishes,
And for praise she never fishes,
Mother does the chores.

Father's gone to town today,
Mother does the chores;
All the rest are bent on play,
Mother does the chores.
All are happy, all are free,
Just when they see fit to be,
No ones left at home to see
How mother does the chores.

Children romping off to school,
Mother does the chores;
Happy 'neath the teacher's rule,
Mother does the chores.
Packing up the dinner pails,
With good things she never fails,
Through sunny days and stormy gales
Mother does the chores.

Father comes home late at night,
Mother does the chores;
Children quarrel and sometimes fight,
Mother does the chores.
Mary lets the dishes go,
Goes to town to see a show
With a shining brand new beau,
Mother does the chores.

Mother's always on the job,
Mother does the chores;
Just to please her big son, Bob,
Mother does the chores.
Mother's always just the same,
Always there to take the blame,
Guess perhaps it is a shame
Mother does the chores.

My address is Route 4, Juneau, Wis.
Your everlasting member,
Adela Krainer.

In John Brown's Country

Hoard's Dairyman Juniors:—I am a 12-year-old girl living on a farm about thirty miles west of Kansas City and three miles from the Kaw river.

The Kaw bottom is famous for its potatoes, the main crops being potatoes, alfalfa, and corn, while the upland runs to diversified farming and dairying.

The Co-operative Dairy Association has a station at Eudora that ships whole milk to Kansas City for the retail trade.

The state university at Lawrence is in plain sight of our home. I have three sisters attending the university. There is a total attendance of about four thousand.

On our farm is an old log house that was built by an Indian about 80 years ago. The tradition runs that on the night of Aug. 20, 1863, W. C. Quantril, the Guerilla, on his way to sack Lawrence, stopped at this house and compelled a twelve-year-old boy to accompany him and show him the way, it being a dark night and dense timber all the way.

After their departure the boys' father started on horse back to go around and get ahead of them and notify the people of Lawrence, but in riding at a rapid speed through the timber his horse struck a tree and broke his neck and threw the rider off and also broke his neck.

Near us is the Wakarusa river which was the scene of a good many of John Brown's escapades.

Would be glad to hear from any of the juniors, especially any living in the far West. My address is R. 3, Eudora, Kans.

Agnes Coleman.

Making the Hens' Day Longer

Hoard's Dairyman Juniors:—I am glad to have the privilege of writing to you. I am very much interested in cattle and poultry. We have about six members in our club.

I have set 8 duck eggs and hope to have good success. I have six hens and a rooster. They are Rhode Island Reds. I feed them dry mash, grain, and crockery dishes broken up fine.

There is an electric light in the hen house so at evening they can eat also. I am getting 11 eggs and one of my hens is setting on the duck eggs. I have a clean hen house and good box for them to lay in. They have plenty to eat and to drink. I have not had to use a glass egg to make them lay. I belong to another club also. It is "A Band of Mercy to Dumb Animals".

Massachusetts. Eugene Baldwin.

PICTURES YOU'LL PRIZE

Kodak at the Fair

Fair time means vacation time to you and your family, and that means Kodak pictures as a matter of course. Everybody takes a Kodak on vacation.

You'll make pictures of the picnic along the roadside, of prize stock at the fair grounds, of your own entries in county or state competitions.

Autographic Kodaks $6.50 up. "Kodak on the Farm," just off the press, is free at your dealer's or from us.

Eastman Kodak Company, Rochester, N.Y.

The WINDMILL with a RECORD

The Auto-oiled Aermotor has behind it 9 years of wonderful success. It is not an experiment.

The Auto-oiled Aermotor is the Genuine Self-Oiling Windmill, with every moving part fully and constantly oiled.

Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet.

The Auto-oiled Aermotor is so thoroughly oiled that it runs in the slightest breeze. It gives more service for the money invested than any other piece of machinery on the farm.

You do not have to experiment to get a windmill that will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine.

Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production. The Aermotor is made by a responsible company which has specialized in steel windmills for 36 years.

AERMOTOR CO. Chicago Kansas City Dallas Minneapolis Des Moines Oakland

Send No Money

FOR THIS DURO SEAMLESS SANITARY MILK PAIL

Bottom and sides are one piece. Both interior and exterior surfaces are perfectly smooth, so there are no seams or crevices to harbor bacteria. The Duro Pail is made of **heavy gauge steel** heavily tinned, and will give a lifetime of service.

The Duro Seamless Hooded Milk Pail is strongly recommended by dairy authorities, for its use prevents dust and dirt from falling into the milk pail during milking.

Duro Pails are made in 14-qt. size only, and weigh 7 lbs. each. They may be supplied without hood when so ordered.

Send your name and address today and the Duro Sanitary Seamless Hooded Milk Pail will be shipped at once. When delivered pay the postman $2.25, (and a few cents extra for postage). Money refunded if at the end of 10 days you are not thoroughly satisfied with your purchase.

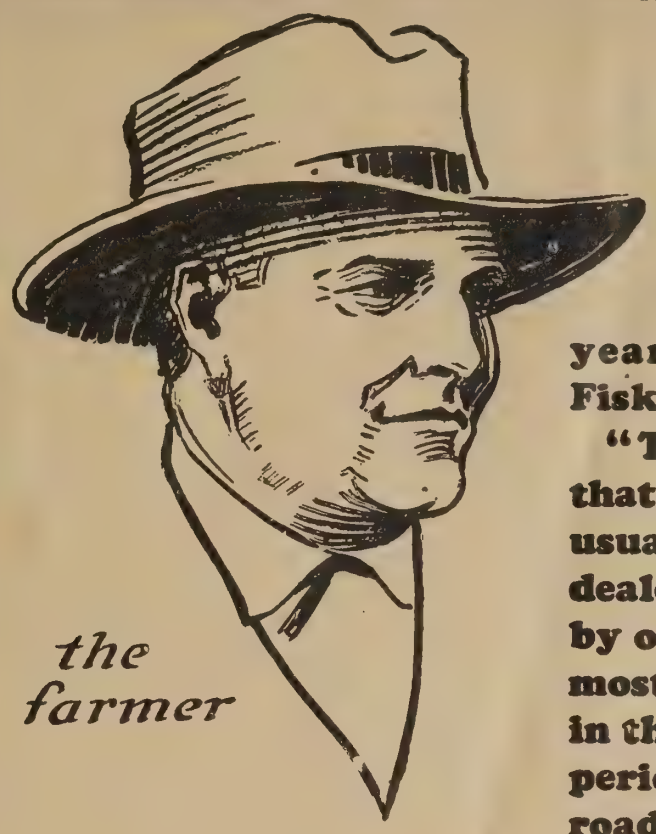
Friendly Talks for Farm Folks

Orval Holcomb used to go fishing so much that he was the despair of his wife and the neighbors, who marveled that Orval's farm got along without him as well as it did. But finally things came to such a pass in the spring of the year that Mrs. Holcomb decided to give her spouse a lesson he'd remember. So she broke up all four of his pet fishing-poles into stakes for the tomato vines, and when Orval went to get his paraphernalia in pursuit of his favorite outdoor sport, he was told to go and fish in the truck patch for a change and see if he couldn't catch something there beside suckers. Strange as it may seem, Orval took his medicine in fairly good humor and that year his wife had the time of her life bragging up their extra fine tomatoes. Whether it was the bamboo stakes or the hoeing the vegetables got as per Orval's former piscatorial schedule—at any rate the Holcombs have lots better and more truck to market than formerly. But as Mrs. Holcomb admits, not all men might be weaned so easily from their unprofitable hobbies.

⚜

We were delighted to read of the progressive locomotive out near Chicago which did its duties on the fired-up milk in its boiler. We have always predicted that some day the discovery would be made that milk in place of gas for the busy automobile would revolutionize the dairy industry. But meanwhile, until our locomotives and horseless carriages generally take up the food-fuel, we imagine the harassed pedestrian would think that heaven on earth were here if the drivers of the latter vehicles would only confine themselves to filling the human engine with cow brew instead of bootlegger's embalming fluid.



⚜

You can't make us believe that the much maligned flapper isn't just as strong for one thing—ice cream—as ever she was, before we heard so much about pocket flasks and ladies' cigarettes. When it comes to eating ice cream Americans, young or old, take a back seat for nobody. And a country whose young people love ice cream to the extent of numberless sundaes and cones a day hasn't gone quite yet to the everlasting bow-bows via its adolescent boys and girls.

⚜

Speaking of ice cream, did you try for the big prize offered recently by the Associated Ice Cream Manufacturers of America? You recall that a slogan is to be purchased on the order of Ivory Soap—It Floats; Have You a Little Fairy in Your Home?; and a million others which have become household words everywhere. When we receive the first prize, which always seems a foregone conclusion until the other fellow gets it, we expect to buy a very nifty closed car with it, in case our husband doesn't beat us to cashing said check first and dispensing it for an equally valuable herd sire he has in mind. Of course there is an exceedingly remote possibility that we may not win this valuable prize. But if we do not, it will be for the usual reason—judges of such contests are invariably blind to real merit when they see it and so refuse to hand us the many thousand dollars a year we ought to earn if all such efforts of ours were properly rewarded. You have probably noticed this partiality and blindness on the parts of contest committees yourself—if you are a consistent entrant like us to all such brain-breaking businesses.

New York. HELEN S. K. WILLCOX.

"A GOOD MANY cars have come into our part of the country during the past two years equipped with Fisk tires.

"Their owners tell me that they are getting unusual service from them; dealers say they are made by one of the largest and most reputable concerns in the business; from experience I know for our roads it is the best tire I have ever used."

An Ohio Guernsey Record

HOARD'S DAIRYMAN:—Janet of Prospect Hill, a Guernsey cow owned by Mrs. Alice R. G. Dalby of Ohio, has recently had her third Advanced Registry Record approved by the Guernsey Cattle Club, making her state champion and giving her sixth

JANET OF PROSPECT HILL
OWNED BY MRS. ALICE R. G. DALBY, OHIO

place among the ten national leaders of her class.

The comment is frequently heard that making a yearly record subjects a cow to too great a strain. These three successive yearly records which Janet has made is evidence that these tests develop dairy qualities, Mrs. Dalby says.

With her first record, made as a three-year-old on two milkings a day, she was credited with 8,150.1 pounds milk and 401.99 pounds fat. The following year she produced 13,456.9 pounds milk and 664.13 pounds fat, while her third record made at the age of five years and 254 days gave her a credit for 18,537 pounds milk and 828 pounds fat, which means an average daily production of 23.7 quarts milk and 2.6 pounds butter per day for 365 days.

This cow has proven an unusual persistent milker. She did not go dry between her first and second yearly records, nor again at the completion of her last record before freshening. She milked 9 gallons in one day and on completion of her last record she was milking over 4 gallons a day.

She has proven herself a reproducer as well as a producer. Her last calf, carried during 266 days of her record, is a male sired by Langwater Buccaneer, a May Rose linebred sire. Janet has a two-year-old heifer just starting on her Advanced Registry test, now milking five gallons a day.

Janet is the daughter of Mrs. Dalby's first Guernsey cow, Beauty of Chestnut Hill. These creditable records have justified her original selection of a foundation cow.

The Prospect Hill Guernsey herd is Federal Accredited and Mrs. Dalby is marketing a superior quality of whole milk. She has recently received a permit to use the American Guernsey Cattle Club "Copyrighted Label" which is granted only to producers of Guernsey milk conforming to strict sanitary regulations and operating under the supervision of the state and national organizations.

Ohio. E. R. RAYMOND.

Cattlemen's Conference

A National Dairy Cattlemen's Conference will be one of the new things for dairy farmers at the National Dairy Exposition to be held at Milwaukee, Wisconsin, September 27th to October 4th. This conference will commence at 10 o'clock on the morning of October 1st in the Woman's Building on the Exposition Grounds. Every farmer and buyer of dairy cattle in the country may sit in at the first conference although delegates will be sent by many states.

The big work of the Conference will be to work out rules and regulations to govern sales of dairy cattle and to formulate an organization to safeguard the interest of buyer and seller on the highest line of business integrity.

The sword wounds the body, but words wound the soul.—Proverbs of Arabia.

Nov. 11-12—Holsteins. Fond du Lac County Holstein Breeders' Sale at Fond du Lac, Wis. S. H. Bird, Mgr., So. Byron, Wis.

LUCY THOMPSON

The Girl's Room

If you want to have some fun yourself and at the same time raise your young daughter to the seventh heaven of bliss, just map out a plan—and then execute it—for fixing up her room.

I have some friends who did this at a total cost of $17 and the result was an exquisite room and a 14-year-old daughter as happy as a princess in a fairy tale. Of course they had some of the things to start with but they developed the room around a small, old fashioned bed which they bought for two dollars and enameled ivory-white.

The style of the bed just seemed to call for rag rugs, ruffled curtains, and that sort of thing and they decided to make things green and white, always a charming color combination for a young girl. I never saw a young birch tree in spring with its lovely white branches and delicate green leaves that it doesn't remind me of a slender, beautiful young girl dressed for her first party.

The curtains of this room were of cheap but effective scrim with a narrow green ruffle of organdie down the middle and across the ends. The bed cover was the same with a deep ruffle all the way around reaching nearly to the floor. This ruffle was finished with an inch band of the green.

An old fashioned wash stand made a modern dressing table. The father cut away the lower part in front leaving only the top drawer. This made a space for the knees of the person sitting in front of it. The same enamel used on the bed was used for this and for a kitchen chair that was to stand in front of it as well as for the frame of the mirror hanging over it. A very full, white curtain hung around the sides and front. This had the same inch band of green as did the bed cover. It is best to have a split down the front of the curtain so as to be able to push it back. Sewed to brass rings (18 for a nickle at the five-and-ten) and suspended from a brass rod, it slips very easily.

Every girl would love to have her own desk but a substitute will please her nearly as well. A small painted kitchen table with a drawer but no leaves makes an admirable desk and a pair of home-made book ends painted a contrasting color will hold a convenient row of books across the back and be ornamental as well.

If the room is large and you have an extra sanitary cot it makes a pretty day couch and saves a lot of wear and tear on the regular bed. A green burlap cover does not show dirt readily and will stand a lot of romping.

If you want to make a really lovely cover for the couch, get two shades of green sateen using the lighter for the top and the darker for a valance and for a few pillows. You can make a charming tie-up by using some of the green sateen for side drapes at the windows letting them hang straight to the bottom of the sill or a little below.

For the floor, black paint, well dried and waxed, makes a fine background for green and white rag rugs, braided.

In buying, it is well to remember that there are blue greens and yellow greens and that they are decidedly different and inharmonious.

Some persons feel that the minute they redecorate a room they must put up pictures regardless of whether or not they have any that are suitable. This is particularly a mistake in the room of a child as his mind is still in the making and is easily influenced. No pictures should ever find their way into his room simply because they are not suitable anywhere else.

Several of our monthly magazines are using copies of famous paintings for covers or illustrations nowdays. These are richly colored and are really very decorative. I have three of them in plain frames that I have picked up from time to time at sales for a quarter. You can do the framing of these in five minutes and when you get tired of one you can put in another. The story of artist and painting goes with these pictures and a child once told it interestingly, will remember it always.

A separate room for each child is of value as it gives a good chance for training in housekeeping. This applies to boys as well as girls. A great many tired wives would be rested if their husbands, as little boys, had been taught to be orderly. It is impossible to teach a child to put his things away if he has no place to put them but provide him with a place and then teach him at the point of the paddle to use it. Your daughters-in-law (or sons-in-law, as the case may be) will rise up and call you blessed.

Being constantly with people is hard on any disposition and that is the greatest argument in favor of having rooms where we can go and be alone; not to mope and be morbid in but just for collecting our thoughts and inviting our souls. Children need them as well as grown-ups.

The Kitchen Pendulum Swings Back

When grandmother built her kitchen it was as large as the whole of a modern city apartment and she walked miles getting her meals. She also had it finished with a good practical color with the result that the whole effect was rather dull.

After awhile we got the idea of sanitation and we all decided that we ought to have kitchens all done out in white like a hospital in order to be clean. We tried this for awhile and found out that to keep them white meant that we spent about half our time working on it.

Now the pendulum has swung back, as it nearly always does, to a sensible medium and we have kitchens that are lovely to look at without being woman killers. These have neutral tinted walls—not drab—in good clear tones of gray, green, or tan and with linoleum and curtains or some painted furniture to match, they are a joy to have.

If you are building this year do spunk up and have the kitchen just the way you want it. Most of us don't because we are afraid the men will think we are disagreeable. The time-honored argument is always the height of the kitchen sink and if you have ever broken your back over a low one, you will never give up till the new one is the proper height, no matter what the plumber says.

The newest little bride I know has plain yellow gingham curtains at her kitchen windows with a two and a half inch white ruffle around them. Her linoleum is blue and yellow, her mixing bowls are yellow, her walls are tan, and her woodwork is just plain varnished pine. It is an old house but she has made it a lovely place. We older women sometimes smile at a bride's attention to small things like having her bread bowls match her curtains, for instance, but such things cost no more, so why not have them? The small things, I often think, have a greater effect on our lives than the big ones and I believe we would all be better off if we insisted more on having them right.

Summer Plum Pudding

An easy dessert for a hot day is this pudding with a gelatine foundation. Prepare one package of lemon jello according to directions or else use a corresponding quantity of gelatine.

Add to this one cup of seedless raisins that have been washed, one cup of apple diced, and one cup of grape nuts. No sugar is needed unless you like it very sweet. When it is set, serve it with whipped cream.

You can make this still richer by beating in a cup of cream, whipped, just before the gelatine has set and then allowing it to become firm. When the cream is put in the pudding it may then be served with custard on top or with more whipped cream.

Buy soap in large enough quantities and thus take advantage of wholesale prices. A hundred cakes will not last too long if stored in the attic or any dry place, with the cakes piled so that air can circulate around them.

The clothes line is a rosary
Of household help and care;
Each little saint the mother loves
Is represented there.

And when across her garden plot
She walks with thoughtful heed,
I should not wonder if she fold
Each garment for a bead.

A stranger passing I salute
The household in its wear,
And smile to think how near to kin
Are love and toil and prayer.
Julia Ward Howe.

Fashion Magazine

From the front cover of our Spring and Summer Fashion Magazine right on through the book, you will see all of the styles which will be popular during the coming season. Styles for morning and afternoon wear as well as those needed for the more formal occasions. And cute styles for the kiddies. There are dressmaking lessons for the beginner, and charming styles which can be made in a couple of hours even by one who is a novice with the needle. Also photos of the most popular Broadway, New York, actresses. So settle your dress problems by sending 10c today for our new Fashion Magazine. You'll save dollars by doing so. Address Fashion Department, Hoard's Dairyman, Fort Atkinson.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Miscellaneous Fashions

No. 1987—Becoming Style for the Large Woman. Cut in sizes 36, 38, 40, 42, 44 and 46 inches bust measure. Size 36 requires 3⅞ yards of 40-inch material with 4½ yards of braid.

No. 2042—One-Piece Overblouse. Cut in sizes 16 years, 36, 38, 40, and 42 inches bust measure. Size 36 takes 1⅝ yards of 36-inch material with 3 yards of binding.

No. 2121—"Jiffy Dress". Here's a dress that can be made in an hour so we have called it our "Jiffy Dress". The accompanying diagram shows how one straight length of material is used to make the entire dress, the patterns for which cut in sizes 16 years, 36, 38, 40, and 42 inches bust measure. Size 36 takes 3 yards 36-inch material with ¼ yard 36-inch contrasting and 1¼ yards of ruffling.

No. 2047—Side-Front Closing Dress. This design would be pretty made in voile or dotted Swiss if you wanted a warm-weather tub frock. The summer silks would also be nice developed in this style, the patterns for which cut in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 takes 3⅝ yards of 40-inch material with 1 yard of 28-inch contrasting and 2¼ yards of ruffling.

No. 2026—One-Piece Dress. This design cuts all in one piece. Cut in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 takes 3 yards of 40-inch material with ¼ yard 27-inch contrasting and 6 yards of binding.

No. 1656—Two-Material Morning Dress. Cut in sizes 34, 36, 38, 40, 42, and 44 inches bust measure. Size 36 requires 2 yards 36-inch material with 1⅜ yards of 36-inch contrasting.

No. 1807—Boys' Suit, consisting of blouse and knickerbockers. Cut in sizes 4, 6, 8, 10, and 12 years. Size 8 requires 2⅝ yards of 36-inch material.

Little red ants, a great household pest, can be trapped by sponges soaked in sweetened water. When the ants collect on the sponge it should be dropped into boiling water.

POULTRY On The DAIRY FARM

J. B. HAYES

Other Points

When a definite check is made in a number of different ways and from various angles, the results obtained are more definite and accurate than is possible when only one method is followed. The reason for striking a trial balance is to assure accuracy.

In addition to body conformation and indications displayed by the head, there are several more points that are worthy of consideration. Feed and management have an effect on the flock and culling but the entire flock is one unit under the same conditions and subject to the same influences. If one tried to use the same standard of excellence in a poorly managed flock as that in a good one, possibly the entire bunch would be culls. The practice is a comparative proposition and one must use good judgment. The poorest producers within that flock are what one must cull. As a bunch they may be poor but some are better than others.

One of the stations has set an arbitrary rule this year in that they will not cull any flock that has not been fed a complete dry mash during the entire year. The proper feed makes maximum production possible and consequently assures greater perfection in the culling results.

In the yellow skin breeds such as Rocks, Reds, Wyandottes, Leghorns, and a host of others, there is a gradual fading of the yellow pigment from certain sections. The places in which this change is most easily noted are the eyelid, beak, and legs. In Leghorns the change can be seen in the ear lobe but not in the breeds that produce brown eggs and have red ear lobes.

Young stock will have an abundance of yellow color in the sections noted if fed yellow corn and given an abundance of green feed. When production starts the color disappears until after about two weeks the eyelids will be white instead of yellow. As production progresses the color in the beak next to the head will disappear and a line will be noted that gradually grows outward until after two months of heavy production the beak will be faded.

The front of the legs will lose their color more rapidly than the back and about four months is required for this fading. The intensity of color when production starts will influence the rate at which it fades but the times stated are approximately true. If the bird is producing, one may be sure that fading will occur. During the season of culling, any hen that carries a deep yellow color in those sections has not been laying or has taken a long vacation, for the color comes back when production stops. Fading will occur when production starts and from this one can readily see that the test cannot be applied to the growing pullets or breed such as Orpingtons or Minorcas where the shank color is other than yellow.

More controversies have arisen over the subject of molt in relation to production than any one of the other points. In spite of all that has been said this change is an indication of production when the rapidity of the molt rather than the time of the year is stressed. That is the important consideration that has been completely ignored.

It is admitted that the length of laying year is true index to the number of eggs that can be produced. A pullet that starts laying in October and finishes up in November of the next year has a wonderful chance to make a big record. If another individual starts laying in March and stops in July her chances of heavy production are decidedly poor. Since production stops when molting starts, one can estimate the length of the laying year in that way.

As egg production and feather growth are intimately associated, one will look for a hen that molts quickly. It will be found that, almost without exception, the hens that molt early molt slowly and those that molt late molt quickly. If one finds an occasional hen that does molt early in the season but peels all over at one time, she should be kept for that hen will come right back into production. The same holds true of the late molter that loses her feathers slowly and comes back into production slowly. In this case there is something wrong with the hen and not with the system. Sometimes the statement has been made that it is advisable to keep a hen just as long as she molts late in the season. I would correct that by adding due emphasis to the rapidity of the change.

Last and least are the pelvic and keel bone test. Before starting on that, a word should be said about the abdominal section. A soft, velvety feeling that indicates a workable digestive tract is desired. When that region feels hard and lined with unabsorbed fat, the hen is one of the poorer producers. Interior quality as indicated by exterior handling is vitally necessary.

The keel bone is the underline of the fowl while the pelvic bones are located on either side of the vent. Emphasis has been placed on the desirability of a long keel that supports the abdominal section and prevents the so called "broken down" hens. In the same way distance from the keel up to the pelvic bone indicates the capacity of a hen. This measurement is usually taken in finger widths and is spoken of as a 4-5-6-7 or more finger hen. Little, shallow, shrunken hens in the abdominal section are not worth while. They should be deep for the breed, soft and pliable.

Distance between the pelvic bones indicates production. Before production starts in a pullet, these bones will be almost closed. As production starts the bones spread and remain in that position until she stops when they close again. From this one can see that the size of the egg controls the spread that will occur. One can satisfy himself on this point by noting the difference in width in a male, an immature pullet, and a laying hen. This test distinguishes between a hen that is in laying condition and one that has stopped.

Use all of the points that have been noted for real successful culling results. Don't place all the responsibility on one single point.

New York Experiment Station Jerseys

(Continued from page 51)

erage dairymen are obliged to use the untried sire. It is partially for this reason that the Experiment Station has tried six unproven sires and developed a herd with them that the production of this herd is of such interest to dairymen and breeders.

Beginning in 1902 when the first bull was ready for light service and ending with 1923, the daughters of six bulls have finished one or more lactation periods. Three daughters of the seventh bull will finish their first year's record in 1924. One hundred dollars has been all that the Station could afford to pay for a bull calf and all but two were purchased at this figure. By correspondence the author learned that one bull bought for $100 was valued at a higher figure and $150 was assumed to be his sales value. One bull cost $150, and another that was bred at the Experiment Station was figured at $100. The total cost of the six bulls was $700 or $116.66 each, and calculating this on the basis of 22 years, the average yearly cost of the bulls was $31.82. The entire herd cost an original outlay of $250 for the two foundation cows and $31.82 per year as the purchase price of the bull calves.

Cheap, untried bulls of poor breeding are not being recommended for general use. These figures are given to show that a pure-bred herd can be developed at a cost within the reach of all farmers. In a similar manner a high producing grade herd can be obtained at a very reasonable cost. The purpose of pure-bred cattle is primarily to increase production in the offspring with a fair degree of certainty. This result has been accomplished because the herd produces an average yield of fat which is double that of the average production of the cows in New York State, and during the past two years every heifer that freshened has equalled the heifer equivalent of this production.

In 1922 the Station herd produced an average yield per cow of 7,185 lbs. milk and 407.6 lbs. fat. According to the last New York State statistics the average cow of New York State produced 5,060 lbs. milk. Assuming a test of 3.8 per cent this milk contained 167 lbs. fat. It is recognized that these cows would have increased their production to some extent if they were fed better. The Station herd of 26 pure-bred Jerseys produced the equivalent of 37 average cows in total milk production and 63 average cows in total butterfat production. Expressed in another way, this difference is even more striking. There are estimated to be 1,415,000 cows in New York State producing 7,173,000,000 pounds milk containing 272,524,000 pounds butterfat. If these cows produced as much milk and fat per cow as the Station herd of Jerseys, 400,000 could be killed without decreasing the total quantity of fluid milk and 740,000 could be slaughtered without reducing the total fat supply. When the cost of developing a pure-bred herd of this character and their producing ability are more generally known by farmers it is inconceivable that less than 5 per cent of the cows milked by farmers in this country would be pure-bred.

(EDITOR'S NOTE: This is the first of a series of four articles by Mr. Dahlberg on lessons from the herd experience of the Geneva Station for the past quarter of a century. The next article will appear in an early issue.)

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Sore Teats

I would like to know what to do for cows that have sore teats when they first freshen. The teats are smooth and they finally get sore and heal up.

Stanton, Mo. A. D.

The teats are very tender at first so that milking should be done gently during the "breaking in" process. If possible have a woman milk the heifers until they are accustomed to the act. If the teats become sore immerse them for 5 minutes or more night and morning in hot water containing all the boric acid it will dissolve, then dry gently and apply a mixture of one part of compound tincture of benzoin and three parts of glycerin. If any sore is tardy in healing apply strong iodine ointment once or twice daily. Milk with clean, dry hands after cleansing the teats.

Fails to Breed

I have a very good ten-year-old Holstein cow, but she will not conceive. She comes in heat at her regular time except when bred when she misses coming in heat at her usual period, but comes in heat again in 41 to 42 days. Is there anything I can do for her in the way of feed or treatment which would correct such a condition and cause her to conceive?

Beatrice, Nebr. F. S.

The cow apparently aborts and that most likely is due to infection with the contagious abortion disease. To determine if such infection is present you should have a sample of the cow's blood tested at the state experiment station at Lincoln. Your veterinarian can arrange to have that done. Meanwhile have him treat the cow and do not have her bred before 2 or 3 periods of heat have passed. If she proves to be affected with the contagious abortion disease she should be isolated and treated accordingly. In that event also cleanse, disinfect, and whitewash the stable, including floors and gutters, under direction of the veterinarian.

Letting a Calf Nurse

A question of cow management has arisen which we desire to refer to you for decision. We have a good grade Guernsey heifer which calved at 25 months; she is rather small, has a good bag and fair sized teats. Her calf was small and we propose to turn it into veal. The point is whether it is injurious to the cow to allow the calf to run with its mother, as we have done for three weeks. Our neighbors say we shall "spoil" the cow as a milker, although we bring her into the stable twice a day, feed her, and strip her of milk. The other side of the argument is that a young, small heifer does not give much more milk than will satisfy the calf; by handling her we get her quieted down, and when the calf is taken away we shall not find the cow any the worse. At least it will not effect her future milking qualities.

British Columbia. W. C. G.

The danger is that a serious shrink in milk secretion may occur when the calf is weaned to sell as a veal. That will be less likely to happen if you milk the heifer partially twice daily and make the weaning process a gradual one. Sudden weaning would be most dangerous. If carefully conducted no permanent injury should result from letting the calf nurse and weaning it gradually when fit for veal.

A Cow Blanket that won't tear out

Notice how this blanket is reinforced. Heavy straps and patented 4-point anchorage give it extra strength at points of strain where ordinary blankets quickly tear out. Made of genuine khaki duck. Rust proof, hold-tight fasteners. Outwears other blankets 2 to 1. First choice of breeders everywhere. Always shows up stock to advantage.

EVER FAILING OR NEVER FAILING PASTURE

Part 6.

Sweet Clover Saves Many Acres of Farm

WILBER J. FRASER, University of Illinois

Land is the greatest investment in farming.

The experience of 81 farmers shows that the use of sweet clover pasture instead of bluegrass saves the dairyman two acres of land for every cow he keeps and in fact just the same as presents him with a deed to twice as many acres of land as he has cows. This is certainly an immense saving and the higher priced the land the greater the saving.

AT the present time land is the greatest item of investment in farming. Whether the land is owned or rented, the cost every year in interest or rent is a large part of the cost of production—about 40 per cent of all in dairy farming.

In the early days, land was very abundant and labor was scarce. This was true to such an extent that there was much free range in parts of the country, but even where men owned the land it was good economy to take advantage of every way possible to use land freely to save labor. Later it was considered that dairy farming should be confined to broken, untillable, cheap land because this was the only kind of land that would furnish economical pasture. Dairying then was confined to the summer months and the cows depended largely on pasture for their feed, being dry during the winter and easily maintained on cheap rough feed at that time. This idea of dairying being mainly a summer proposition, dependent on the natural bluegrass pasture, has held over to quite an extent even to the present day, except in the intensive dairy regions where cows are fed large quantities of grain, hay, and silage, both summer and winter. But even here, much pasture is used and it is still largely bluegrass.

Poor Pasture Wastes Land

The last quarter of a century has seen most fields of agriculture advance by leaps and bounds, but the yield of pastures has been little studied or improved. This is true in both the scientific field and in the art of dairy farming with the result that, in spite of the use of large acreages of pasture per cow, dairy cows and heifers are often more neglected and actually suffer more from lack of feed during the summer growing season than during the bleak winter when all crops are frozen up and dormant. The farmer realizes at that time that he must provide *all* the feed for his cows, and consequently he does so. It is from the lack of knowledge of the failure of bluegrass that many starve their cows during the summer.

This point is one of the weakest factors in the operation of most dairy farms because the six growing months should be the time of year that dairy cattle are fed cheapest, easiest, and best, and with a small amount of land per cow.

Sweet Clover Pasture Saves Two Acres Per Cow

We have seen in Part III that it requires an acre and a half of bluegrass pasture and an acre and a half of cultivated crops, making a total of three acres, to adequately support a dairy cow for the summer six months. On the other hand, the testimony of 81 men, as reported in Part IV, shows that sweet clover has a pasture value of about four times that of bluegrass and thus requires only one-fourth as much land to supply a given amount of feed. The result of this is that it requires only three-fourths of an acre of sweet clover and one-fourth of an acre of corn—to grow the small amount of grain needed—to keep a cow for the same length of time. So we see, *the use of sweet clover pasture instead of bluegrass saves the dairyman two acres of land for every cow he keeps and in fact just the same as presents him with a deed to twice as many acres of land as he has cows.* This is certainly an immense saving and the higher priced the land the greater the saving.

It is true that some dairymen who pasture bluegrass do not use this amount of land per cow in growing the feed for the summer six months, but they either have exceptional bottom land for their bluegrass or else they do not supplement it properly with sufficient other feed, and thus allow the cows to go hungry and shrink in milk flow.

Lack of land is a serious though very natural handicap in farming. A young man buys the farm he operates when he has little capital and must of necessity be satisfied with a relatively small farm. Later he wants to operate on a larger scale—keep a larger herd of cows and perhaps more hogs, or sell grain. He would then be glad to buy more land, but there is none for sale near by at a reasonable price. He does not want to leave the home and farmstead he has improved to his liking; he does not want to leave friends and neighbors and move to a different locality; and he feels at a serious disadvantage. But this man may easily help himself out of his dilemma by changing his bluegrass pasture to sweet clover and thus release a considerable acreage on which to grow other crops. This applies in a greater or less degree to every live stock farmer, because everyone would be glad to have land released at little or no expense.

HERE 25 ACRES OF SWEET CLOVER PASTURE SAVE 75 ACRES OF TILLABLE LAND

THIS dairy herd of 40 cows and 10 heifers, belonging to Mr. Meyers in Northeastern Illinois, is pastured on 25 acres of sweet clover. He turned out April 30 and his cows increased in milk flow even though all the silage, legume hay, and grain were discontinued. Last year on bluegrass, he fed silage until the first of July, but says his cows produced better during May and June this year on sweet clover alone.

The cows were producing an average of 25 pounds of milk per day, and the clover was knee-high June 26, as may be seen on Mr. Meyers, who is standing among his cows; but the bluegrass on this side of the fence, in which Farm Adviser A. J. Gafke is standing, does not cover his shoes, and it has not been pastured this year.

This bluegrass is a portion of the 100 acres on which this herd was pastured last year, and Mr. Meyers says that it did not furnish as much feed as one-fourth this area in sweet clover is furnishing this year. This is an actual example of where 25 acres of sweet clover replaced 100 acres of bluegrass, and saved 75 acres of fine, tillable land.

What the Dairymen Say

The following quotations are typical of the many replies received in answer to the question, *"From your experience, how much better is sweet clover pasture than bluegrass"?*

"Sweet clover will pasture four cows where the same area of bluegrass will pasture only one."—E. J. Giss, Northern Illinois.

"One acre of sweet clover is equal to four acres of bluegrass pasture."—Levi Wait, Northern Illinois.

"Sweet clover pasture produces about three times more feed than does bluegrass and has become my favorite pasture."—E. Elsbury, Northern Illinois.

"I get three times the feed from sweet clover pasture that I can from the same area of bluegrass."—G. A. Vasey, Northern Illinois.

"Sweet clover is three times as good as bluegrass pasture."—George Klitzing, Southern Illinois.

"One acre of sweet clover pasture is equal to three acres of bluegrass."—Nick Maes, Southern Illinois.

"Sweet clover pasture is four times better than bluegrass. Really it can

Starting A Dairy Under Difficulties

FLOYD A. POWELL, MISSOURI

I HAVE gotten so much from reading about other persons' experiences I feel that I should try to help some one else by giving my experience in raising week-old calves under ordinary farm conditions and when no skimmilk is available.

The soil in Montgomery County, Missouri, is not the best in the state but the farmers compete with the farmers in the corn belt in raising corn, hogs, and wheat. At best it is a gamble and in the past few years the farmers have been hard hit. Gradually the farmers are turning from the old established method of farming into dairying, as this is a fine grass country. Any cow that shows dairy qualities may be sold for a large price.

The winter and summer of 1921 my brother attended the Missouri University and worked with the dairy department to help pay his expenses. He became a lover of Holstein cattle and enthused over dairying, so he took the necessary training to become a cow tester. He applied for and got the job of cow tester for West Kent County Cow Testing Association, Michigan. When he left we decided to start a dairy of our own. He was to buy young heifer calves about 3 or 4 days old from high testing Holstein cows and ship them to me and I was to raise them. By this method we would know that we were getting good stock and at a lower price than they could ordinarily be bought at. He has shipped me eight heifers and one bull.

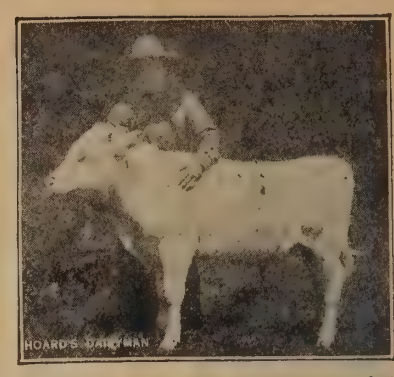
Dot at 16 months of age. When received by Mr. Powell she was two weeks old and weighed 115 lbs. Her dam has a record of over 10,000 pounds milk in a Michigan cow testing association.

The first two calves came together and were about three weeks old. They were fed once on the trip from Michigan to Missouri, but were very hungry when they were brought home. To prevent making them sick I gave them all the warm water they would drink. The way I started them drinking was by letting them suck my thumb, then slowly emerge it in the water, then I remove my thumb and they drink. After they had drank all the water they wanted I let them suck the cow, about a quart, then eight hours later I let them have about two quarts and the third feeding they got all they wanted. As they were three weeks old they were soon eating bran and hay.

I have used this same plan for every calf and have found it to be O. K. The calf will drink about two or three gallons of water the first thing. It has had no ill effects that I could notice and they were more satisfied than if they had been allowed only a small amount.

When the calves are two weeks old I begin to fasten them to a trough with just a handful of bran in it. The calf will soon begin to eat but I am careful not to leave any in the trough. I keep timothy hay before the calves at all times, as also water. I have raised the entire lot with only one cow and as we have no separator I let them suck her, having as many as three sucking at one time. No. 1 and No. 2 at night and No. 1 and No. 3 in the morning (No. 1 being the youngest calf). It has been necessary to wean several at 8 to 10 weeks of age. I feed a mixture of 100 lbs. oats, 100 lbs. bran, and 25 lbs. oil meal. Each calf gets as much as it will eat twice daily until it is eating about 2.5 or 3 lbs. daily. Corn stover and timothy are used for roughage as no alfalfa or silage is available.

When the weather is good the calves run out but during cloudy weather they are kept in a shed. They are kept well bedded, always having dry straw covering the entire shed. Warm water was kept in front of them at all times during the cold weather and the water pail was washed out and scalded once daily. The calves have never been bothered with the scours. I once read to mix a little common salt with the feed whenever the calves showed signs of having the scours and have found it to work well.



I have never lost a calf and only once did a calf fail to eat heartily. She had been out just after a killing frost and probably had eaten some frost bitten weed and got poisoned. She came up slightly bloated and refused to eat. I forced an egg in her mouth and she swallowed it. The next morning she was bawling for feed. Barring this one time I have never had any to refuse to eat.

My brother, a cow tester, selects calves from extra good cows to send me. The dam of one has a three-year average of 9,993 lbs. milk containing 404 lbs. fat. The bull is from a 23-lb. 3-year-old and his grand sire is from a three times over 30-lb. cow. His dam had the highest month record in Michigan association work, with 126 lbs. fat in 31 days.

The two oldest heifers have recently been bred, being about 16 months old, and when they freshen my brother expects to discontinue his work as cow tester and manage our herd. His experience as tester and association with successful dairymen will be of great value in handling a herd of his own. Our heifers are only high grades but we intend to purchase a few high testing pure-breds in the near future.

This spring we sowed about 12 or 13 acres of sweet clover and an acre of alfalfa as an experiment. Alfalfa is not supposed to grow here. If we are able to grow it, it will save buying so much high priced mill feed. As an aid to the cows we have a herd of registered spotted Poland-China hogs and Barred Rock chickens.

This article is not in accord with the acknowledged practice of raising calves but necessity is the mother of invention. We were determined to have a dairy herd and could not invest any large amount of money. The calves might have been larger if they had been fed alfalfa in the place of timothy, but alfalfa costs so much

The bull calf at six months of age that weighed 125 pounds and was one week old when received by Mr. Powell in Missouri.

here it is almost prohibitive. I have found out that it is almost impossible to grow a calf without milk, at least until it is 6 or 8 weeks old. No calf feed will take the place of milk before that, at least that has been my experience.

Some may wonder if my calves aren't stunted. They aren't. I have had some rather flattering offers for them but refused to sell them. If skimmilk and alfalfa, or any legume, are available, feed them by all means but if they aren't do not think little calves can't be raised because they can.

The best I can estimate, these heifers will have cost when fresh, $100 each, exclusive of work. Where can you beat such stock at that price?

I consider my success in raising these calves under ordinary farm condition is due to the following:

1. Feeding: Feed a good balanced ration and all the calves will eat.

2. Cleanliness: Keep the stalls clean and well bedded. Keep the troughs clean and wash and scald the water pail daily. Use clean, pure water for drinking.

3. Regularity: Feed and care for the calves at regular hours. They will look for feed at that time and handle better.

4. Kindness: Be kind to the calves, have them gentle; they will do better, be easier to handle, and will show themselves better when anyone visits the herd.

5. Alertness: Watch for sign of the calf's condition, watch the droppings and its hair. Read all about handling cows possible, listen to everyone that has had any experience in the work and select whatever applies to your conditions.

Maryland Fitting and Showing Contest

THE second annual fitting and showing contest was held May 31st, at the University of Maryland, College Park. The contest was held under the auspices of the Students' Live Stock Club which is composed of students in the Dairy Husbandry and Animal Husbandry Departments. The instructions on fitting and showing the animals were given by a member of each of the two departments. A total of forty-five animals were fitted and shown. Each contestant was given the privilege of choosing the class in which he wished to work but the animals within each class were drawn by lot to decide the particular animal that each student would fit and show.

Seven classes of dairy cattle, one of hogs and one of sheep, were shown. The dairy classes consisted of one class each of Ayrshire and Guernsey calves, heifers, and mature cows. The winners in each of these six classes came together for the championship class. Ribbons were awarded to the first four individuals in each class and two additional prizes were awarded to the first and second individual in each class. These two prizes for each class were given by breed journals, farm papers, and publishers or writers of books on live stock. A silver loving cup was presented by Professor J. A. Gamble, head of the Dairy Husbandry Department, to the winner of the championship class for dairy cattle.

The following are the winners in each class of dairy cattle: Ayrshire calves, George Stokes, Maryland, first; Floyd Ritter, Virginia, second. Ayrshire heifers, Harry A. Stewart, Virginia, first; John Toxey, North Carolina, second. Ayrshire cows, L. P. Ditman, Maryland, first; Edward J. Smith, Maryland, second. Guernsey calves, Douglas A. Parran, Maryland, first; Laurence A. Wilson, Maryland, second. Guernsey heifers, Clarkson J. Beall, Maryland, first; Harry Hamlin, Maryland, second. Guernsey cows, H. T. Cottman, Maryland, first; C. W. Seabold, Maryland, second.

George C. Stokes of Maryland won the championship and silver loving cup with the Ayrshire calf, Bonnie Bonnie Maes.

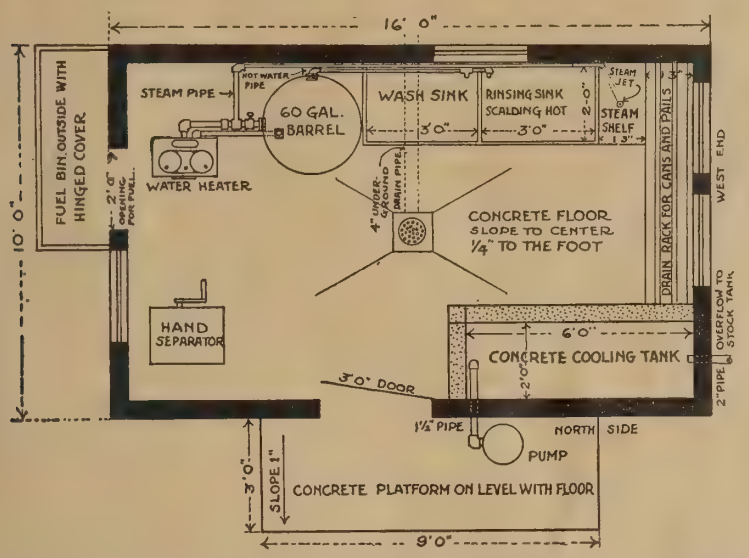
Louis McL. Merryman, Maryland, placed the dairy classes and B. E. Carmichael, Extension Specialist in Animal Husbandry, placed the hog and sheep classes.

The dairy cattle were fitted and showmanship taught by Professor L. W. Ingham of the Dairy Husbandry Department, assisted by the herdsman, A. M. Stagg.—J. A. GAMBLE.

OFFICERS OF THE STUDENTS' DAIRY CATTLE FITTING CONTEST, UNIVERSITY OF MARYLAND

Left to right: N. N. Nichols, secretary; W. A. Bromley, member of show committee; B. H. Roache, president Live Stock Club; J. L. Maglone and T. P. Rowe, members of show committee; W. D. Powell, chairman of committee.

If you are going to do anything permanent for the average man, you must begin before he is a man. The chance for doing good lies in working with the boy and not with the man. —THEODORE ROOSEVELT.



HOT WATER AND STEAM AT SMALL EXPENSE

Plans for Convenient Dairy Houses

C. A. HUTTON, TENNESSEE.

ON farms where dairy cows are kept an abundant supply of hot water is one of the greatest conveniences, and an absolute necessity for properly washing the dairy utensils. They cannot be properly washed unless the water is hot, —"sizzling" hot, not lukewarm. Where only a very few cows are kept the water is often heated on the kitchen stove, but this method is not very satisfactory, as the amount of water heated is apt to be very small and it is not usually very hot by the time it is carried to the dairy house.

If several cows are kept a dairy house should be built and ample provision made for conveniently heating the water. Most dairy farmers now realize the importance of having plenty of hot water and steam in the dairy house, but not many small dairymen have made provision for same for the reason that the equipment recommended in the past has, in most cases, been too large and too expensive for the average farm dairy. In order to find a practical and inexpensive method of heating water and furnishing steam for the average, small farm dairy, the writer has made tests of many arrangements and devices. A small wood or coal stove, or a two-burner oil stove, with a wash boiler on top, or a small, home canner, is one of the cheapest outfits to be had for the real small dairy, but neither of these outfits will furnish steam and neither one is as satisfactory as the arrangement shown in the accompanying illustration.

PLAN FOR A DAIRY HOUSE SUITABLE FOR TAKING CARE OF THE PRODUCT FROM A HERD OF NOT OVER 20 COWS WHERE CREAM IS SOLD

If a large herd is kept and a steam turbine separator is used, the small, upright boiler commonly used to operate the separator may, of course, be used also to furnish the hot water and steam for washing and steaming the utensils. However, many farmers use a small gasoline or kerosene engine for pumping water and find it convenient to operate the separator with the same engine.

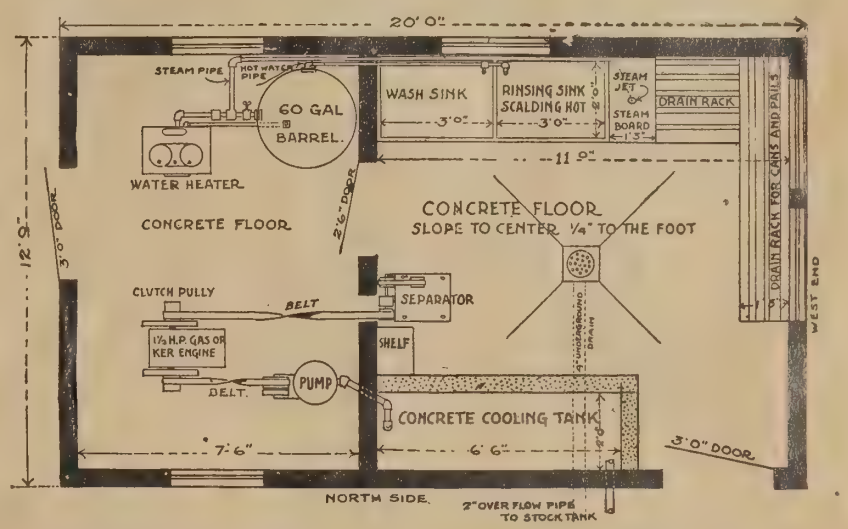
The hot water heating outfit, designed by the writer and shown in the drawing, is an inexpensive and very efficient system of heating water. It also furnishes a sufficient amount of steam for sterilizing the cans, pails, etc. A small amount of coal or wood will heat a barrel of water to the scalding point in a few minutes. The same outfit may also be used for heating water for the farm laundry, bath, etc., in addition to furnishing hot water and steam for the dairy.

As the water in the water jacket or pipe coil surrounding the fire-pot is heated it automatically moves upward into the barrel and cold water from the bottom of the barrel flows into the jacket or coil through the lower pipe line. In this way all the water in the barrel is soon heated. The barrel should be securely anchored to the wall and floor of the milk house to prevent the connections being shaken loose by the movement of the barrel caused by the violent boiling of the water.

In setting up the outfit begin at the back of the heater. Put on the connections on both the top and the bottom pipe lines until the barrel is reached. Bore three 1-inch holes in the barrel at the proper places and complete the connections to the barrel with lock nuts and washers. Then complete the hot water and steam lines to the wash sink and steam shelf.

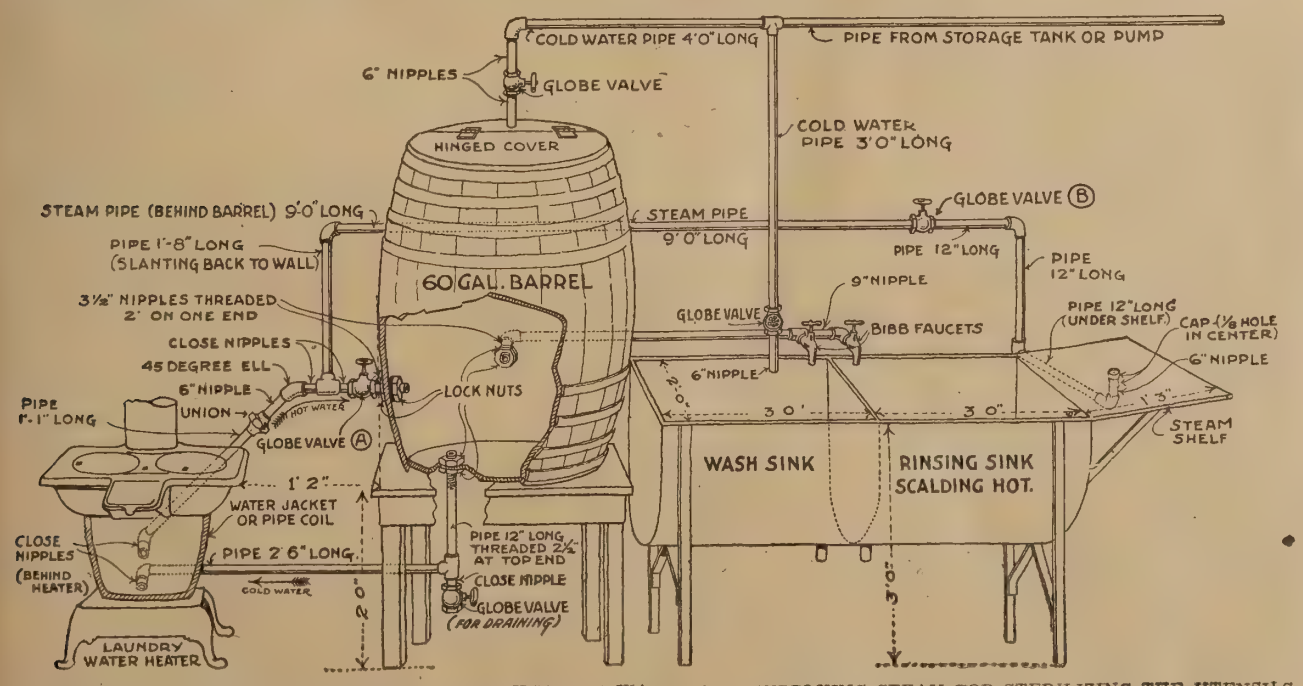
You Can Also Have Steam

Steam for properly sterilizing the utensils is of great assistance in properly cleaning them. The outfit shown will furnish plenty of steam in addition to hot water. When the water in the barrel has begun to boil and the operator is ready to begin washing the utensils, the globe valve A, on the hot water discharge line, is closed. This stops the upward movement of water from the heater to the barrel and the water in the jacket or coil is quickly converted into steam. The utensils are first rinsed out with cold or lukewarm water, then washed in the wash sink, laid over in the rinsing sink filled with scalding hot water, and then inverted over the steam jet for a few minutes. They are then pushed over onto the sunning rack to dry where they may remain until used again. See arrangement shown in the two plans for dairy houses on this page.



While steam is being generated hot water flows into the jacket or coil from the barrel through the lower pipe, and steam will continue to flow through the steam jet as long as valve A is closed and valve B is open. When both valve A and valve B are closed the steam backs up through the lower pipe line and bubbles up through the water in the open barrel, making the outfit absolutely safe so long as an open barrel is used. Valve A should be kept open except when steam is wanted, because the water in the barrel will heat faster if it is open than if it is closed.

The steam pipe behind the barrel must be higher than the level of the water in the barrel to prevent the water from flowing through it before it is converted into steam.



To secure steam where the outfit is connected with a pressure water system or an air tight hot water tank, it is necessary to place a valve on the cold water pipe entering the tank so that the flow of water into the tank can be stopped while generating steam. If this is not done the pressure from the storage tank will force water through the steam line before it is converted into steam. Also place a pop-off valve or an air cock on top of the tank to relieve any excess pressure caused by not using the steam as fast as it is generated. When through steaming, the valve on the cold water pipe entering the tank and valve A should be opened and the water allowed to circulate freely, the same as when heating the water.

If only hot water is wanted the

(Continued on page 92)

DAIRY HOUSE FOR PROPERLY CARING FOR THE CREAM FROM A HERD OF 15 TO 40 COWS WHERE A POWER SEPARATOR AND A POWER PUMP ARE USED

AN INEXPENSIVE AND EFFICIENT OUTFIT FOR HEATING WATER AND SUPPLYING STEAM FOR STERILIZING THE UTENSILS

The following pipe and fittings are required to set up the outfit as shown, not including the cold water line from the storage tank or pump to the barrel and wash sink: 5 close nipples; 2 three and one-half inch nipples, threaded 2 inches on one end, ordinary threads on the other end; 2 six-inch nipples; 1 nine-inch nipple; 8 ells; 1 forty-five degree ell; 3 tees; 1 union; 3 globe valves; 6 lock nuts; 6 washers with 1⅛-inch hole; 2 bibb faucets; 1 cap with ⅛-inch hole in center; 3 pieces pipe 1 foot long; 1 piece pipe 1 foot long, threaded 2½ inches on one end, ordinary threads on the other end; 1 piece pipe 1 foot, 1 inch long; 1 piece pipe 1 foot, 8 inches long; 1 piece pipe 2 feet, 6 inches long; 1 piece pipe 4 feet long (hot water pipe from barrel to faucet); 1 piece pipe 9 feet long; sufficient pipe and fittings for the cold water line from storage tank or pump. All pipe and fittings ¾-inch galvanized. Many water heaters have one-inch holes for the pipe connections. In such cases two ¾x1-inch reducers should be included in the list of fittings. Due to an error in lettering the drawing the length of the wash sink and the rinsing sink is shown as 30 inches. Each should be 3 ft. long. The outfit will be more permanent if a metal gasoline barrel is used instead of the wood barrel. If an airtight barrel or tank is used with the steaming arrangement, either a pop-off valve or an air cock should be installed on the top as mentioned in the article. The outfit can be set up complete as shown, not including the wash sink, for $25.00 to $30.00.

More Than a Coincidence

J. C. McDOWELL, U. S. Department of Agriculture

IF you will look at a map of the United States that shows where the cow testing associations are located, you will observe that most of them are in the great dairy districts of this country. Is that merely a coincidence, or is it more than a coincidence?

On July 1, 1923, there were in the United States 627 cow testing associations. These were distributed throughout thirty-nine of the forty-eight states. There is only one state in the Union that has never in all its history had a cow testing association. The first cow testing association began work in January, 1906, and since that time the number has increased year by year until today there are between seven and eight hundred. The exact number will not be known until the census on that subject is taken the latter part of the year.

On the first of last July the ten states that, according to the 1920 census, ranked lowest in average production of milk per cow had a total of 11 cow testing associations; and they had an average of 0.2 of one per cent of their dairy cows on test. The ten states that ranked the highest in average production of milk per cow had a total of 272 cow testing associations; and they had 2.8 per cent of their dairy cows on test. The percentage on test in the states of high production was 14 times as great as in the states of low production.

Certainly it is more than a coincidence that this is so. But which is cause and which is effect? Did the cow testing associations bring the greater average production, or did the larger production bring the associations? Cow testing association records show that the work results in increased production, but there are not enough associations in operation in any state to account for the larger yields in those states where cow testing associations are most numerous. To me the most plausible explanation as to why the great dairy states have the largest percentages of cows on test is that many wide-awake, up-to-date, progressive dairymen have recognized that the cow testing association is a good thing and they are making use of it to increase further the production and profits from their dairy cows. In fairness it must also be said that the work of the cow testing association is done most economically where the herds are large.

It is very unfortunate that there is so little testing done in those districts where average production is low. It seems that those districts that need it most appreciate it least. No truer saying was ever uttered than, "To him that hath shall be given and from him that hath not shall be taken away even that which he hath." The man who has a good dairy herd is always looking for ways to improve that herd, and it is not difficult, usually, to get him to join a cow testing association. But the man who has a scrub herd seems to be perfectly satisfied to go on milking his scrubs year in and year out. He seldom thinks of improving that herd and he cannot be induced to consider joining a cow testing association. The owner of a scrub herd is reported to have said: "I am only half feeding my cows now and I am losing a little money on them. If I fed them all they would eat I would lose a lot of money on them." I am not sure that the cow testing association or anything else would do that fellow any good.

The annual directory of cow testing associations shows than on July 1, 1923, there were 277,010 cows on test in cow testing associations. That is a little more than one per cent of the 24,000,000 dairy cows in this country. The records show that the cows on test are producing about 50 per cent more milk and fat than those that are not on test. The records further show that practically all the net profits come from that 50 per cent. What then of the poor fellow who owns average cows? To be sure, he keeps out of the poorhouse, usually, but how he does it is a mystery. The wife of a no-account farmer once said to me: "You may wonder how we live. Well, I'll tell you. We don't spend nothin'." Perhaps that's the secret of making a living from scrub cows: "Don't spend nothin'."

Most good, respectable, genuine, red blooded American citizens like to make money and spend it, and they can't do that with scrub cows. On the other hand, the well bred, well-fed dairy herd yields a very satisfactory profit. The average cow testing association cow produces about 6,000 pounds milk and about 250 pounds fat a year. Some association herds produce from 8 to 10 thousand pounds of milk, and from 300 to 400 pounds butterfat. It is a pleasure to milk such cows and it is a pleasure to live on a dairy farm where such cows are kept. If we had a way of measuring the intelligence of farmers I am quite sure we would find a high coefficient of correlation between the intelligence of the farmer and the large production of his cows. I am quite sure, too, that we would find the relation between cow testing association work and large average production per cow something more than a coincidence.

Dozen Reasons Against T. B. Testing

ILLINOIS DAIRYMAN

I HAVE followed carefully articles and editorials appearing in your publication from time to time, bearing on the reliability of the tuberculin test which certain government officials, our farm bureau, and some farm papers, which include Hoard's Dairyman, are "hell bent" upon coaxing or forcing every cow owner in this country to apply to his herd. As the matter appears to me, you perhaps unconsciously fail to bring out some important features of the test which every dairyman should understand before he places his name on what is called a contract to co-operate with the federal government.

As owner of a herd of around fifty head of high grade Holstein cattle, it has been my object to give the question of submitting my animals to the test, more than passing thought. After a careful study of the matter, both pro and con, I can enumerate at least a dozen reasons why I should not test my good cows:

1. The question of whether or not bovine tuberculosis can be transmitted to humans through raw milk is, as yet, a matter over which scientists disagree.

2. The accuracy of the tuberculin test as practiced at the present time is, to my mind, gravely doubtful. A neighboring dairy farmer owning a herd of registered cattle, known as "Federal Accredited", recently shipped his old herd bull to the Chicago stock yards, only to find that the animal was so rotten with tuberculosis that his meat was unfit for food, though he had never reacted to any of the applied tests. I could cite other cases of the same or more aggravated nature. The owner of the bull mentioned is now told that he will doubtless find that some of his valuable cows will be condemned as diseased owing to daily association with the infected bull.

3. I am told that only a small per cent of the cows condemned as diseased are found, upon slaughter, to be infected in organs from which the germs could be drawn through the udder, a large number of such animals showing but very slight or doubtful tubercular lesions.

4. A great many of the statements made to cattle owners in order to induce them to submit their cows to the test are either absolutely false or at least very misleading. The prospective subject is often told that his registered cows may be appraised at higher figures than the law allows, that having only one or two thin or unhealthy cows in his lot may mean that the others are free from disease, when as a matter of fact it is often the healthier looking animals which are found to be reactors.

The statement often made or implied that most of the carriers shipped to the slaughter yards are found to have tuberculosis, is flatly contradicted by a man who is in a position to know the facts.

5. I have been told that should I test my cows, clean up the premises, and use ordinary precautions to keep out further infection, my initial loss would probably be the end but I could mention a great many examples to prove that there is no end of a dairyman's loss after he once signs up. What he thinks is the end may be but the beginning. He may have an accredited clean herd for several years and suddenly learn that 50 per cent of his animals are diseased. Only a few months ago 17 out of 36 head of cows on an accredited Wisconsin farm were condemned as tubercular reactors. Where did it come from? Nobody knows.

6. Authorities advise me that should I test my cattle, as necessary precaution against reinfection, I must fence and bridge a stream from which my cows now drink in summer time and which stream during the freshest season is often wide as a large river. Also I must build double line fence adjoining my neighbor in order to keep my cows from nosing a bunch of native steers which, by the way, the government authorities do not believe should be tuberculin tested. The only alternative is to abandon my large pasture.

7. Several members of the dairymen's organization to which I belong have been compelled to quit the business of dairying owing to the severity of their losses following a tuberculin test. One farmer owning as fine and healthy a looking herd of Holsteins as man ever saw, lost 42 out of a total of 44 head. One animal condemned was said to be the fattest black and white ever condemned as a reactor. The farmer mentioned was forced to the financial wall and lost not only his dairy business but his farm as well on account of the poor judgment he showed in submitting his cows to the hands of a county tester.

8. All the milk from my dairy is carefully pasteurized before being bottled for market and, according to Chicago City Health Department, pasteurization is very accurately done by the distributor to whom I sell. All agree that properly pasteurized milk is free from dangerous bacteria.

9. My cows are valued at an average of nearly $200 each which is $150 more, not counting salvage, than I could recover should I test and lose them, even should they be appraised at the highest permissible figure which, of course, I could not expect.

10. If the drinking of raw milk from untested cows is dangerous to human health, why is the per cent of human infection traceable to the bovine type of tuberculosis so very low in the rural districts of Illinois and other states?

11. As it appears to me, most of the propaganda now being so noisily broadcasted in an effort to coax or force us to test our cows, can be traced to men whose salaries would stop should the farmers refuse them further work.

It is stated that one-third of the three million dollar appropriation recently offered in Congress for use in the eradication of bovine tuberculosis is to go for the salaries and expenses of employees in that particular department. Quite a large sum of money to contemplate when we consider that in addition we must be taxed to pay our local county veterinarian who does the real work. After a little inquiry as to what becomes of that million dollars, one may well wonder if the whole scheme

Association Notes by Testers

Leelanau Co., Mich.: A Better Sire Day was held June 14 and the Farmers' Club June 19. One farm was tested for acidity. Two members feed grain with pasture. The creamery paid 40 cents per lb. for fat in June. Milk retailed for 10 cents per quart.—L. DeYoung.

North Antrim, Mich.: The average producton of 273 cows tested in June was 810.48 lbs. milk, 32.84 lbs. fat; value of product, $12.50; cost of feed, $2.30; net value of product, $10.20; returns for each dollar spent in feed, $5.40; cost per pound fat, 7 cents; cost per cwt. of milk, 27 cents. Fifty-two cows produced over 40 lbs. fat; 13 over 50 lbs. Twelve members weigh milk daily and 20 feed grain. Six separators were tested. Nine new cows were entered. This association has the excellent practice of charging all the cows at the same rates for feeds. This makes it possible to compare cows on a common basis where different methods are employed.—G. G. Mullett.

North Allegan, Mich.: The average of 293 cows tested, 13 of which were dry, was 818 lbs. milk, 29.9 lbs. fat. F. W. Miller's herd of 12 grade Holsteins and Jerseys had the highest fat average of 43 lbs.; milk, 909.7 lbs. Market milk sold for $2.20—$2.60 per cwt. in Grand Rapids; sweet cream, 44—45 cents; sour cream, 39—40 cents.—C. L. Fleming.

Lansing—Ingham, Mich.: One new portable milking machine was purchased. All herds have been tuberculin tested and all members use pure-bred sires. Market milk sold for $1.65 per cwt. The condensery paid $1.55 for 3.5 per cent milk; the cheese factory, $1.60; the creamery, $1.80. Milk retailed for 10 cents per quart.—R. C. Kuhn.

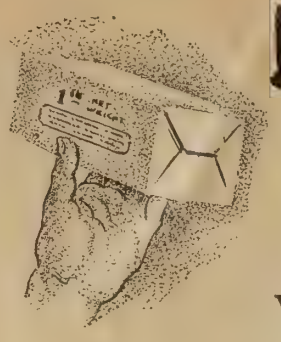
Ada Co., Ida.: One inefficient separator was found. Market milk sold for $2.25 per cwt. The condensery paid 43 cents per lb. for fat; the creamery, 39 cents.—T. E. Maberly.

Columbia, Ore.: Butterfat trend is upward. Milk is not rising in price but indications are for a rise very soon as pastures are dry and production short. Market milk sold for $2.05 per cwt.; sweet cream, 43 cents per lb. for fat; sour cream, 36 cents. The cheese factory paid 44 cents per lb. for fat.—W. T. Noble.

Tri-Co., Ohio: Of the 219 cows tested, 41 produced over 40 lbs. fat, 10 over 50 lbs., 4 over 60 lbs., and 2 over 70 lbs. Twenty-seven cows produced over 1,000 lbs. milk. The average production for the month of June was 653.2 lbs. milk, 33.6 lbs. fat. Two herds averaged over 40 lbs. fat. The Belmont County Jersey Cattle Club planned a tour in this section. Ten automobiles, loaded with people and camping outfits, motored north to Columbiana and Mahoning Counties where they visited a few choice herds. The last stop on the tour was attending an Ohio Jersey Cattle Club sale at Columbiana at which 70 head of Jerseys sold at an average price of $155.—E. A. Mizer.

Snohomish Co., Wash.: Three new herds joined the association in June. One milking machine was installed. Thirteen members out of a total of 45 now use milking machines. Market milk testing 3.8 per cent sold for $2.00 per cwt.; 3.6 per cent milk sold for $2.50 in Seattle. The condensery paid $1.75 per cwt. for milk, the creamery, 40 cents per lb. for fat. Milk retailed for 10 cents per quart.—D. L. Saunders.

Gray's Harbor, Wash.: Two new barns are being built. Sixteen members started feeding bone meal. The cheese factory paid 50 cents per lb. for fat. Milk retailed for 16 cents per quart; butter, 50 cents per lb.—F. R. Haynes.



Floyd Co., Ia.: During June 7 members sold mostly whole milk and 5 sold all whole milk. Eighteen separators were tested and these 18 owners lost 283.2 lbs. fat. This, valued at 40 cents per lb., means a loss of $1,133.20 per month. If only one-tenth of this loss were eliminated, during 10 months enough money would be saved to pay the tester's wages for one year. One barn was whitewashed and one new milking machine was installed. There are 6 milking machines on 26 farms.—J. B. Day.

Tomahawk, Wis.: The 418 cows tested in June averaged 32.3 lbs. fat. Twenty-three cows produced over 50 lbs. fat. Poor pastures are being supplemented with grain. Several members are trying out either alfalfa or soy beans. All members either own or use a pure-bred bull. Milk retailed at 10 cents per quart; butter, 45 cents per lb.; cheese, 27 cents.—W. S. Schneider.

Grass Lake—Jackson, Mich.: This association re-organized June 1. Alfalfa is the principal crop grown. Five members use milking machines. About half of them feed grain or alfalfa or silage. Others are going to start this month. Due to the amount of rainfall, pastures are good generally.—R. A. Hubbell.

Fairfax Co. No. 1, Va.: In June 17 cows were on the 50-lb.-or-better Honor Roll and 88 made 40 lbs. or more fat out of the 599 cows in 25 herds visited. The herd of I. L. Harrison, numbering 13 cows, showed the highest average fat production of 38.5 lbs. Liberal grain feeding of cows on pasture was noted throughout the association. Three members are supplementing pasture with silage which the cows eat readily and

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00 including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Coming Events

Sept. 14-20—Eastern States Exposition at Springfield, Mass.
Sept. 27-Oct. 4—National Dairy Show, Milwaukee, Wis.
Sept. 22-28—Dairy Cattle Congress, Waterloo, Iowa.
Oct. 21-23—Wisconsin Buttermakers' Asso. meets at Chippewa Falls, Wis.
Nov. 1-8—Pacific International Live Stock Exposition, Portland, Ore.

The University of Montana is planning to exhibit the world's largest 10-year-old producer, Grace Koningen, at the National Dairy Show. In addition one of the old time Longhorns that roamed the Montana prairies 50 years ago, is coming by way of contrast. A supply of dairy crops will be shown and a large state delegation will make the trip to Milwaukee.

Washington, D. C., Weekly News

[Special to Hoard's Dairyman.]

Washington, July 29—One of the annual events in agricultural circles in Washington is the issue of the Agricultural Department Year Book. This is one of the big jobs of the Government Printing Office. The 1923 book reached your correspondent through the courtesy of a member of Congress the last Monday in July. The copies to be distributed direct from the Department of Agriculture had not yet put in an appearance.

Dairying had a major place in the 1922 book, it receives only cursory mention in the 1923 edition. This is because the present secretary established a precedent of treating the major farm operations in a series of extended treatises to cover the four year books of his four-year term and dairying was reached in the second book. This year the major topics are Sugar, The Sheep Industry, Our Forage Resources, Land Utilization, and Farm Ownership and Tenancy, with a special article not planned when the original plan was laid out on "The Wheat Situation". In addition to these important topics, there is an even more complete statistical abstract of agricultural and related facts than usual, and a full text of the report of the secretary, which deals in very direct fashion with the difficult economic position of the farming industry last year.

Two important phases of the live stock and dairy work of the Department were judged by the secretary to be of sufficiently wide interest to be specifically considered in his report to the President, the development of the war against bovine tuberculosis, and the effectiveness of the activities directed at better breeding and better feeding. His statement shows that as the result of a questionnaire study of the dairy industry the cost of grains, specifically "the cost of protein", represented more than half of the feeding difficulties noted by the answers received. The study, he states, shows that pure-bred live stock showed greater gains when put upon better rations than scrub stock treated in the same way, the superiority of the improved stock as measured by financial returns amounting to 39.6 per cent over common stock.

Reports received by the Department of Commerce indicate a rapidly growing increase in shipments of Danish butter to Germany. In some ways this is looked on as a real indication of resumption of normal purchasing ability in Germany and renewed economic strength. Should this prove to be the case it may materially affect the flow of butter from Denmark to the United States this coming winter and spring.

Reports from the Tariff Commission indicate that there is a real effort to hasten the butter tariff investigation, for a report to the President by October. Investigators have already gone to Denmark which is "the country of chief foreign competition" specified by the law for determination of production costs to be compared to domestic costs.

New York Notes

HOARD'S DAIRYMAN:—There is less corn grown here this year than for some time. One good farmer whom I talked with just now has no corn at all. Last year he grew more than usual and it helped out mightily. It carried the stock through to grass this spring while without it there would not have been enough feed.

NOTABLES AT THE SECOND ANNUAL SUMMER PICNIC OF MICHIGAN HOLSTEIN BREEDERS

Reading right to left: J. E. Burnett, Asso. Professor Dairy Husbandry, Michigan Agricultural College; D. D. Aitken, Ex-pres. Holstein Ass'n. of America; J. E. McWilliams, Manager Dairy Dept. Detroit Creamery Co. Farms; R. E. Haeger, Holstein judge; H. W. Norton, Jr., Director Animal Industry for Michigan; C. M. Long, Extension Service Holstein Ass'n. of America; O. E. Reed, Head of Dairy Dept., Michigan Agricultural College; R. J. Baldwin, Director of Extension, Michigan Agricultural College.

This season he has a little less stock and the season was late so that plowing and planting could not be done in time. Besides, it seemed favorable for a grass crop and there was opportunity to earn money by working at building in town so the corn was left out. It may have been some risk but it is now found that the barn will be full of hay and the corn not needed to feed as roughage. There is less corn, more hay, and more money earned by working in town. Years ago I doubted the advisability of a farmer working for wages away from home but times have changed. Many farmers cannot arrange their home work so that they can leave for work elsewhere but some can and it pays. In this case that I have mentioned the farmer was able to care for his stock and earn about ninety dollars one month this spring.

Our farmers frequently are the ones wanted for town jobs. They know how to do most work and they work with greater interest. Sometimes, as in the case stated, they get higher wages. This man did the work of two partly because he tried to make the work count and partly for the reason that he knew how to make every motion count. On one job the owner objected to the wages and hired two men to take the place and finally got the third for the afternoon. He wanted the farmer back the next day. And yet you will find many people in town who talk that farmers would be all right if they would really work and cease talking about low prices.

In spite of the apparent breakdown of the committees on milk prices, I cannot feel that the meetings of the committees have been bad features. I know that it has brought criticism and some of it where it does not belong but I think that it has opened up conditions to view in a way that will in the long run be beneficial. There is a vast amount of misunderstanding as has been the case all along; yet as the days pass the real truth of milk prices seems to be coming to the surface. It is pretty sure that other conferences will be held, it seems to me. Indeed, one is now scheduled for August ninth. The state dairymen's association is in this as are also the Holstein breeders of the state. No high prices for milk are in sight but a better understanding for organization perhaps.

New York. H. H. LYON.

Fire Destroys Plant

We are in receipt of the following telegram from O. M. Plummer, General Manager of the Pacific International Exposition:

"The 10-acre plant of the Pacific International Live Stock Exposition was entirely destroyed by fire July 23. The loss amounts to one-half million dollars, which is fairly well covered by insurance. Reconstruction of this building will begin immediately and the Exposition for 1924 will be held as usual. The dates are November 1st to 8th, inclusive. It will be bigger and better than former expositions. We feel sure that what now appears to be a misfortune will be a blessing in disguise in that it will bring together more firmly the breeders and business men of this country and make them realize to a still greater degree the value of the Live Stock Exposition to the live stock industry of this great country. We call upon the breeders and exhibitors everywhere to show their faith in our institution by making a bigger and better show than they have ever done before."

Uncle Ab says that many a time it's better to do a thing than to be an expert on how it ought to be done.

Wisconsin Dairy Statistics for the Year 1923

	Pounds	Received for or valued at
Cheese produced in factories, other than cottage, skimmilk, cheese curd, cooked, buttermilk, and cream cheese	343,313,245	$ 77,433,752.7
Cottage, skimmilk, cheese curd, cooked, buttermilk and cream cheese	5,570,002	368,438.7

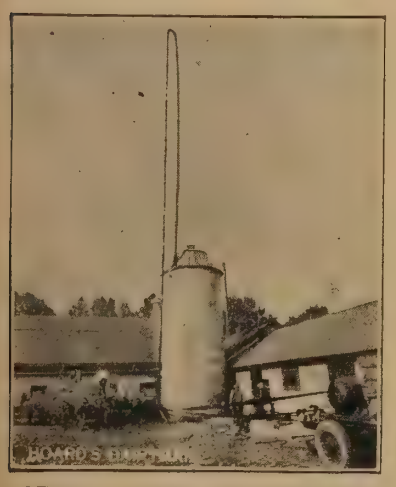
Ice cream (gallons)	6,031,996	6,260,250.4
Milk produced other than furnished cheese factories, butter factories, condenseries, and ice cream plants, (pints)	960,621,235	28,818,637.0
Skimmilk	2,808,699,346	10,953,927.2
Whey	3,191,292,487	6,223,020.3
Estimated value of milk and cream shipped to Chicago, St. Paul, Minneapolis, Dubuque, and other points outside of Wisconsin	276,936,482	5,732,585.1
Total		$247,215,451.9

SILO FILLER TESTS



THE efficiency of silo filling machines came under the careful scrutiny of the agricultural engineering staff at the Wisconsin College of Agriculture last fall. As a result of these trials the future will see increased efficiency in the outfits and saving to farmers using them due primarily to this intensive investigation. F. W. Duffee, who directed the tests, figures that Wisconsin farmers who yearly elevate some million tons of silage into one hundred thousand odd silos will be saved about one-third of a million dollars annually as a result of these trials.

Co-operating with fourteen manufacturers of silo filling outfits the Wisconsin engineers had twenty different machines under observation to determine the draft of the cutters, the advantage of anti-friction bearings, the power necessary to elevate ensilage to different heights, and the power required for the separate operations of cutting and blowing. As the investigations went along an unexpected factor entered into the work, mainly the relationship between the speed of the cutter, the tonnage per hour, and the amount of power. As a result of these trials some manufacturers are making changes both of major and minor nature in the design and make-up of their machines to enable them to operate on a more efficient basis.

When the final reckoning was made the results showed that the difference which exists between the power requirements of different machines was due primarily to perfection of design rather than type. It was impossible to base any definite conclusions on these tests with reference to the advisability and advantages of anti-friction bearings in silo filling outfits.

With the speed and capacity of a machine remaining the same, the investigations disclosed that the power requirements increase gradually and slowly as the height of elevation increases. By checking it was found that the power requirements of a certain machine, whose capacity was about 15 tons to the hour, was 1.606 H. P. hours a ton at a 100-foot elevation as compared to 1.436 H. P. hours per ton at 30-foot elevation. On this basis the increase in power required, as compared to a 30-foot elevation, was 11.9 per cent greater cutting dry corn.

The relation between the R. P. M. capacity and power requirements was one of the outstanding revelations of this series of tests. In machines of 14 inches and larger, men are the limiting factor at speeds in excess of 575 to 600 R. P. M. This is on the usual basis with two men throwing off the load. The capacity in tons per hour was actually decreased in several instances where the machine was speeded up. This in all probability was due to the psychological effect upon the workmen.

TESTING POWER REQUIREMENTS AT A 100-FT. HEIGHT

In their haste to keep the machine working to capacity under the increased speed, they worked against themselves and much wasted effort resulted. When this test was repeated several times, similar results were obtained.

Another important observation regarding the power requirements for high versus low speeds was that at the higher speeds there was an extremely wide fluctuation in power requirements. Observation of the ammeter connected on the line to the motor revealed the fact that loads in excess of 40 H. P. and lasting for a few seconds were not uncommon when operating a 16-inch machine at 706 R. P. M. While at the slower speeds these peak loads are not nearly so high and the load is more uniform—a desirable condition.

The question naturally arises as to whether a machine will elevate properly under practically any and all conditions at this slow speed. The data shows that two machines elevated dry corn 100 feet at 662 and 670 R. P. M. respectively. This indicates that if a machine is properly designed it will elevate into silos of ordinary heights at 500 to 600 R. P. M. However, these reduced speeds must not be adopted until it is absolutely certain that the machine will elevate under ordinary adverse conditions. Further, it will probably be hard to convince a great many farmers that the capacity at the slower speeds is as great as at higher speeds, as machines are ordinarily fed.

With the smaller machines the capacity of the machines seems to be the limiting factor with two men throwing off and therefore the capacity is about in proportion to the speed. That this same thing is true of larger machines when they are fed to capacity is demonstrated by referring to one of the tests where a capacity of 22.1 tons of dry corn per hour was secured at 760 R. P. M. This was done by throwing off part of the load into two piles, one on each side of the feed table. Four men threw on to the feed table and two or three were helping feed.—Wisconsin College of Agriculture.

Cost of Area Test Work

The Wisconsin Department of Agriculture keeps an exact record of the cost of doing area work and has recently issued a statement showing what it cost to test all the cattle in Clarke County. It must be remembered that the exact cost cannot be determined, but the following figures are the approximate cost of testing all the cattle in Clark County:

Salaries of veterinarians	$9,080.82
Salaries of clerks and assistants	685.22
Expenses of veterinarians (Including clerks)	4,517.11
Storage, gasoline, and oil	147.24
Telephone and telegraph	106.51
Miscellaneous (Hire for horses and equipment)	2,244.07
Ear-tags	2,231.63
Tuberculin	267.79
Total	$19,280.39
Total number cattle tested	89,265
Total number herds	5,273
Total number reactors	1,604
Total number infected herds	768
Total number cattle in Inf. herds	16.782
Total number pure-bred cattle tested	3,637
Estimated average cost per head	22c
Per cent of infected cattle	1.8
Per cent of herds infected	15.0

Northwest Conference

Plans for a northwest-wide agricultural conference, to be held at the Minnesota state fair grounds on Thursday, September 4, are now under way. The main topic slated for discussion is the future of dairying and diversified farming in the Northwest. Governor Preus has invited over 700 municipalities to appoint from one to three delegates to represent their communities at the conference. It is expected that nearly 1,500 delegates will attend this conference for the purpose of encouraging increased diversification of crops in the Northwest.

Eastern States Exposition

Ninety-six thousand dollars, a record premium offering, will be distributed in cash awards at the annual Eastern States Exposition from Sept. 14th to 20th inclusive, detailed announcement of awards and classifications being contained in the Exposition premium list.

Total cash premiums in the several cattle divisions will amount to $28,685. In the swine department a total of $3,810 is offered and in the draft horse department there will be cash awards of $6,105. There have been increases in the prize offerings for sheep, the 1924 total being $4,206; while in the horse show classifications, these being the awards for the Springfield Horse Show conducted under the direction of the Exposition, the total offered in cash is $17,495 in addition to numerous specials and plate.

Massachusetts. J. H. FIFIELD.

FOR SALE

Well Improved 360-acre Farm in Central Michigan at Nearly $20,000 Below Appraised Value

This 360-acre farm is located in the central part of Michigan, in Isabella County, four miles south of Clare and 12 miles north of Mt. Pleasant, the County Seat. It is in a prosperous and well improved farming community. Excellent gravel roads and interurban service. School and churches at Rosebush, a nearby village.

Mt. Pleasant, a city of over 5000, is made prosperous through surrounding farming, dairy and stock breeding industries. It has a good high school, a large government school and a central State normal school.

The Ann Arbor railroad passes through part of the farm with a railroad stop and loading switch on the farm.

The soil is a clay loam, light to dark chocolate in color.

Its crops are sugar beets, alfalfa, clover, timothy, wheat, oats, rye, peas, beans, silage, corn and fruit.

The lay of the farm is generally smooth and gently sloping. There are three very good orchards, mostly of apples, in fine bearing condition, on about 7½ acres.

BUILDINGS: There are three houses. The main house has 12 rooms, hardwood finish, concrete basement under entire house, hot air heating system, commercial gas lights and gas for cooking. The main barn is built in L shape, each part being 50 by 100 feet with full basement under all, solid cement floors and walls, patent stanchions, 8 horse stalls, 4 box stalls, feed bins, harness rooms, large cement water tank in basement and several large departments for stock. There is a 200-ton concrete silo with frame lumber. There are two other houses, 3 other barns, 2 hog houses, 2 chicken houses, ice house, wood house, creamery and brick smoke house.

An Appraisal Company, selected by the Michigan Dairies Company, appraised the buildings at $45,000.00 less 25% depreciation, making a net value of the buildings $33,750.00 and 360 acres of land without buildings at $36,000.00, making a total net valuation of $69,750.00.

The owner, a practicing dentist in Milwaukee, Wisconsin, is anxious to sell and offers this farm for $50,000.00. Terms ½ cash, balance on long time, 6% mortgage.

Better Milk Bigger Profits

Keep your milk sweet and wholesome by cooling and aerating it with the "Chilly King" Prevent losses from souring and returned shipments

Chilly King
Cooler and Aerator

Cools milk perfectly—without ice—and secures its thorough aeration. Simply built. Easy to clean—no filth-catching corners. Milk flows in a thin film-like sheet over V-shaped Spiral Rings. Practically 100 per cent efficient. Sizes for all-sized herds. Write for catalog.

Alfalfa Time Is Here

May's hardy adapted upland grown Kansas. Nebraska or Dakota varieties. Write for our special alfalfa sheet. Prices reasonable. Before buying be sure to get May's prices.

There are no maybe's in May's seeds.

MAY SEED & NURSERY COMPANY,
331 May Bldg., Shenandoah, Iowa.

EDITORIAL COMMENT

NATIONAL DAIRY EXPOSITION

The National Dairy Exposition, in Milwaukee September 27 to October 4, will be held somewhat differently than in former years. At the Auditorium, located in the heart or Milwaukee, will be displayed machinery and supplies for the milk plant, creamery, ice cream factory, cheese factory, and milk powder and condensed milk plants. In short, all articles used in handling milk and manufacturing it into various kinds of dairy products will be on exhibition. At the fair grounds, some distance away, will be found the pure-bred dairy and grade cattle. Farm machinery, barn equipment, and dairy farm supplies will also be on exhibition at the fair grounds. The judging contests by agricultural college students, boys' and girls' contests and demonstrations, and amateur cattle judging contests in which dairy farmers will participate, will be held at the fair grounds. The exhibits at the fair grounds will be more for the dairy farmer and those interested in production, while the exhibits at the auditorium will be of more interest to those engaged in the manufacture of dairy products.

The Dairy Exposition has grown to be such a mammoth institution, carrying so many educational exhibits and demonstrations, that it is not possible to find one building in this country that will house all its various activities.

BIG BUSINESS

It is not uncommon to find persons against any business that is big. It does not matter to them how efficient and honest and useful the business may be—if it is big, it is bad. They think laws should be enacted making it difficult for such institutions to exist. This is, of course, false reasoning.

A business may be large and honest and a business may be small and dishonest. A business should not be measured by its size, but by the kind of service it renders and whether it is fair in its operations.

The New York Dairymen's League, a farmer-owned, co-operative institution, has become a big business. In 1923 it did a total business of over $75,000,000. What will the misguided people say regarding this farm organization which is owned by the men producing milk and marketing their product co-operatively? The purpose of this institution is to get better prices for the producer, which all agree he is entitled to, especially the last few years. The Dairymen's League has tried to market its members' product efficiently and by rendering this service it has committed no crime, even though it did transact over $75,000,000 worth of business in 1923.

We will not get very far in solving our agricultural problems or in establishing proper relations between all industries by decrying an institution because it is large. What every honest and just man is interested in is to have all individuals and all institutions conduct their affairs upon an honest basis, to be efficient, and not exact the "pound of flesh".

PRICES OF FARM PRODUCTS ADVANCE

We recently met a farmer who takes rather a gloomy view of agricultural conditions. We said to him:

"John, the farmers ought to be feeling more optimistic and encouraged for the prices of wheat, hogs, and corn have made substantial gains in the past thirty days."

His face did not reveal any satisfaction over the advance in the prices of these products which have been selling too cheap, but he said:

"I don't see how the farmer will be benefited very much, for all the wheat is in the hands of the speculator."

"How is that?" we queried. "Harvesting has not started in the spring wheat section of this country and such states as Kansas and Nebraska are right in the middle of wheat harvesting and threshing has only well begun."

The farmer has every reason to take a more optimistic view of his vocation. The thinking farmers, with whom we have come in contact the last thirty days, show a decided improvement in state of mind. They observe advances in prices of wheat, corn, and hogs and comprehend their meaning. Even men who do not raise these crops feel good over the improvement of prices for they know they will indirectly affect the prices of dairy products.

Some rather bad spots here and there are to be found throughout the dairy industry. A number of cities have had an overproduction of market milk. In some cheese sections the prices of certain types of cheese have sold at low prices. Taking it on a whole, however, the dairy industry has held a rather enviable position. The prices of creamery butter, during the months of June and July, have been good and well managed creameries will pay in the month of July in the neighborhood of 40 cents a pound for fat.

Prices of hogs, wheat, and corn have reached a level which should bring encouragement and satisfaction to all farmers. Hogs sold in Chicago on July 28 for $10.50; wheat, $1.40; and corn, $1.10.

Let us be optimistic over the change for better conditions for agriculture and not blindly state that the wheat is in the hands of the speculator.

E. S. BRIGHAM

We regret that Hon. E. S. Brigham has tendered his resignation as Commissioner of Agriculture of Vermont, which position he has held for the past eight years, to become a candidate for Congress. The farmers of Vermont can ill afford to lose the service of a man who is so sound in his agricultural ideas, so practical in their application, and, with it all, trustworthy and honest.

Mr. Brigham is not only a good executive and understands the farmers' problems, but he operates a successful farm of his own near St. Albans. A visit to his place will reveal that he not only understands the theory and practice of agriculture but he knows how to make farming pay. His farm has paid good dividends all through the present period of agricultural depression. He knows that to make money on the farm something better than the ordinary must be followed; his cows must yield a little more than the average; his acres must produce more than the average; and the crops grown must be those that will be in demand in the market and they must be graded and prepared in such a way as to bring the best prices.

A man able to organize his own business, especially a farm, and have it pay good dividends is an unusual executive and a most thorough student of farming. He is the kind needed in positions of leadership, for agriculture is suffering today because we do not have a sufficient number of capable leaders—those that not only understand the successful operation of farms but also understand the farmer's problems as they relate to preparing his products for market and marketing them co-operatively. Mr. Brigham, from the time he has taken this office, has devoted himself to studying ways and means of getting the farmer in position to process his own products, to prepare them for market, and to market them co-operatively. He has been a true friend of co-operation for he has outlined practices which could be followed and would succeed and at the same time keep the farmer in direct control of his own affairs.

His work in behalf of tuberculosis eradication has been outstanding. He has had his battles with those who are against the tuberculin test and has won. The thinking farmers followed his leadership, and good work is being done in Vermont in freeing its herds from tuberculosis.

The agriculture of this country needs more men like Mr. Brigham in Congress and he may be able to render as great a service there and perhaps more than he has as Commissioner of Agriculture in Vermont. Nevertheless, with a man so well equipped for discharging the duties of commissioner of agriculture, we regret he is leaving this position.

REASONS AGAINST T. B. TESTING

Elsewhere in this issue will be found an article by one of our Illinois subscribers, entitled "A Dozen Reasons Against T. B. Testing". Those who read this communication and who understand the nature of bovine tuberculosis, the limitation of the tuberculin test, and the mistakes which have been made in its application, will have no difficulty in understanding why this dairy farmer gives a dozen reasons in his mind against the tuberculin testing of cattle. It is plain as a basis of his objections he is taking exceptional instances and errors which have been made and of incapable and dishonest work of those who have applied the test. The unfortunate thing about his position is that it is based upon wrong premises.

For a period of more than twenty years dairy farmers in the Chicago milk territory have listened to unsound advice regarding the tuberculin test and tuberculosis. It is well for the dairy farmers in that section that these men who have been making misleading statements and who have been poisoning their minds against the tuberculin test, are fast losing their grip, for several counties in that territory have made and are making area tests.

The tuberculin test is not 100% accurate. Those best informed do not make any such claim for it. It has been shown repeatedly that the tuberculin test, in competent hands and honestly interpreted, is better than 95% accurate. No one denies that when an animal has a generalized case of tuberculosis it may fail to react to the tuberculin test, but the competent veterinarian can invariably locate such animals and will have them removed upon physical examination.

We feel the danger of transmitting the bovine type of tuberculosis to human beings has been over-stated. On the other hand, scientists, whom we consider wholly reliable, have found human beings suffering from the bovine type of tuberculosis. If we disregard the health side of tuberculosis eradication and consider it wholly from the standpoint of profit, the dairy farmer cannot afford to keep this disease on his farm. It is to his interest very largely that tuberculosis be eradicated. It is unnecessary to make misstatements regarding indemnities or misstatements in any respect. What should be given the uninformed man is accurate information concerning tuberculosis and a simple outline of how to proceed to eradicate it.

We have made a close study of this disease for more than thirty years and we know that when capable men are placed in charge of tuberculosis eradication work, splendid results follow. We know, too, that when a dairy farmer or breeder once frees his herd from tuberculosis he is not indifferent to keeping it clean. Our Illinois subscriber cites twelve so-called reasons against tuberculin testing. Now will someone cite one reason why the dairy farmer should keep a diseased herd of cattle?

Does Milk Increase with Decrease in Test?

I was very much interested in the articles on "Why Tests Vary" in the issues of May 2 and May 30. I wonder if the weights of the milk vary the same as the test in the table published in the May 30th issue.

It has been my experience that the butterfat yield per day is fairly constant; that is, if the test is a little higher than the average, the amount of milk will decrease proportionately.

I would like to see some figures published comparing the record of the cow testing association with official tests made for the same period. Do

not the average tests of the association's records check very closely with official tests?

Spokane, Wash. G. W. H.

Mr. G. R. Rice has given us the following reply to the first part of this inquiry:

"The tests quoted in the article mentioned were made of the total daily shipments of individual producers into this market. The amounts shipped are fairly constant for the test period, being the total daily production of the herds tested.

"There is naturally some variation in weights due to the fact that attempt is made to ship only full cans. The following shows the daily weights, tests, and pounds fat of one herd, which is typical of all:

June	Milk	Test	Fat
	lbs.	%	lbs.
9	328	3.50	11.48
10	381	3.30	12.57
11	330	3.25	10.72
12	332	3.25	10.79
13	327	3.30	10.79
14	320	3.30	10.56
15	324	3.40	11.02
16	314	3.30	10.36
17	304	3.20	9.73
18	303	3.30	10.00

"Weather seems to affect test materially. The June 16 test was generally low, following the severe electrical and rain storm the previous night in this section; the cows were out in the pastures during the storm. The variation in test will not be so marked in those sections not subject to great atmospheric disturbances, is my belief."

We would appreciate other replies to the inquiries by G. W. H.

Finds Sweet Clover Good

HOARD'S DAIRYMAN:—I have been interested in Mr. Fraser's articles on Ever Failing and Never Failing Pasture.

We have about 80 acres of western rye and native or wild grass pasture that 9 head of cattle and 32 horses grazed pretty close before a 10-acre field of sweet clover got large enough to graze. For the past six weeks we have had a dry spell and grass pastures are very brown, but on the sweet clover our stock have done fine. The cows give a full flow even though resting much of the time. The sweet clover is from 4 to 12 inches high and the 10 acres give more feed than the 80 acres of grass. Our alfalfa does not furnish the production the sweet clover does.

Newville, North Dakota. W. P. M.

Brown Curing Alfalfa

I note in your letter from Edw. Hoverson that he has had success by mowing alfalfa when free from dew, allowing it to wilt 2 or 3 hours, and then storing it away as quickly as possible.

This is very interesting, not alone from the point of view of saving all the leaves, but also if it is a thoroughly practical way of making hay it would save us a great deal of loss due to frequent showers.

Would you kindly advise us of your opinion of this method of making hay? I note that Mr. Hoverson states there is no danger from mildew or otherwise if the product is free from rain or dew.

Maryland. R. R. M.

There is little that we can add to Mr. Hoverson's statement concerning the curing of alfalfa hay other than to refer to Professor Graber's article of several weeks ago in which he discussed various methods of making alfalfa hay. In this discussion he described the method followed by Mr. Michels of Wisconsin, which is similar to that followed by Mr. Hoverson.

The making of brown alfalfa hay has been discussed several times in Hoard's Dairyman and those who have written us are very enthusiastic over it. We have been convinced from letters and personal conversation that this method of curing gives an excellent quality of hay. We have been tempted to try out this method on our own farm but confess to some timidity in putting this green material in the large barn which houses our stock. We are theoretically convinced that it will do no damage through spontaneous combustion, but are sufficiently conservative to hesitate to put away our fears for the sake of our faith.

The brown or tobacco cured hay is very appetizing and in our own experience we have found that cows would eat it eagerly. That is, we have occasionally had small spots of this hay in our mow that would come out a dark brown and with a smell much like honey. The cows would eat it with avidity. Scientists tells us that the fermentation through which this hay passes, destroys a certain amount of its nutrients. We are not certain but that this loss may be compensated for, in whole or in part, by the increased palatability of the hay and the possibility that the nutrients may be rendered somewhat more digestible.

We have had growers in the alfalfa regions tell us that they like to sell their "pea green hay" and reserve for their own use the tobacco cured hay. They also tell us that if there is no external moisture on the hay, there is no danger of mold providing the hay has been evenly and thoroughly distributed in the mow or stack. In mowing away from the hay fork it is scarcely sufficient to merely let the hay pile up in the middle and then push it in great masses to the side. Care needs to be exercised that the hay is evenly distributed so that it will pack rather evenly. Preferably the hay should not be stored for a greater depth than 6 to 8 feet and, even though the hay gets very hot, it should not be opened up with a fork. We are told that to attempt to open it up may induce spontaneous combustion through the admission of air to the superheated material.

Summer Feeding of the Ton Litter

With a few more than fifty entrants in the 1924 Wisconsin Ton Litter Race, either past or approaching the halfway mark in the contest, all are determined to keep on fighting to the finish. The majority of the litters entered number from 10 to 12 pigs, and the dates of farrowing vary from March 3 to May 26. Most of the litters already have been weaned.

The owners of these prospective ton litters are now confronted with the problem of summer feeding for the maximum growth and gain in weight. Among the 1924 contestants are ten parties who were successful in producing ton litters last year. They will profit from past experience and, barring misfortune, should secure even better results this year.

A discussion of summer feeding of these litters should certainly include consideration of the methods employed by the successful 1923 contestants. One of the outstanding points to be noted in the management of the 1923 litters is the use of pasture. Of the seven litters qualifying in the state contest at Madison, six were raised on pasture. The first and second prize litters were grazed on good alfalfa pasture; of the others, two pastured on bluegrass, one on red clover, and the fourth on red clover followed by sudan grass.

Plans for this summer's pasture have already been carried out. Most of this year's litters are being raised on pasture and a wide variety of forage is in use. In cases where early pasture plantings have not done well or will not supply sufficient feed to finish the pigs, the best pasture to plant at this date will be Dwarf Essex rape broadcasted or drilled in rows at the rate of five pounds per acre.

Feed Proteins, Vitamins, and Minerals

Where pasture cannot be supplied and the litter is being raised entirely in dry lot, some feed must be furnished to supply the ration with proteins of proper quality, vitamins, and minerals. California's champion ton litter furnishes a good example. This litter of eleven pure-bred Poland Chinas, weighing 2,725 lbs. at 180 days, was raised in dry lot. But they were fed good quality alfalfa to the extent of three per cent of the dry feed in their ration. The protein and vitamin supply was further insured by feeding oil meal to the extent of 3.3 per cent of the dry ration and one-half of tankage. They also received skimmilk.

Even on excellent alfalfa pasture, Wisconsin's champion ton litter owners, R. Groth & Son, saw fit to feed a variety of protein feeds. From weaning time until four months of age, their litter received a mixture of 200 lbs. ground corn, 100 lbs. ground oats, and 30 lbs. tankage. They were fed all the whey they cared for and two pounds of oil meal daily in addition.

During the fifth month the oats was omitted and the tankage mixed with the ground corn alone in the proportion of 1 to 10. After five months the litter was fed a slop of two parts ground corn and one part of flour middlings in whey. To this was added tankage and oil meal, two pounds of each daily, and a little salt. In addition they were fed all the shelled corn they would clean up.

A ration so complete and varied as the above provides all the needs of the pig in the way of bulkiness, palatability, proteins, vitamins, and minerals. But such a wide variety of feeds is not entirely necessary for growing out a good ton litter. Mr. R. W. Higday, whose litter of thirteen pigs won second place at the Madison Show, had no dairy by-products available. His litter grazed in good alfalfa pasture all the time and was fed for the first three months a mixture of ground oats, middlings, Schumacher feed, hominy, and tankage. Then oats was omitted and old corn added until the pigs were on full feed. After five months of age they were full fed new ear corn in addition to the concentrate mixture.

Some Used These Last Year

A brief survey of the rations fed to the other successful ton litters show such combinations as the following:

(a) Oats 50, barley 30, middlings 100, bran 75, oil meal 15, salt, tankage, skimmilk, buttermilk, old corn.

(b) Ground oats 100, middlings 100, bran 100, oil meal 25, condensed buttermilk, salt, mineral mixture, and finished on new ear corn.

(c) Soaked shelled corn, flour middlings, oil meal, finished on new ear corn.

(d) Ground oats 55, ground barley 35, middlings 10, tankage 5, mineral mixture, and finished on ear corn.

(e) Schumacher feed, tankage, oil meal, and whey for first four months; then ground oats, barley, tankage, and whey, and finished on new corn.

Of the seven litters mentioned above, three were raised on self-feeders, three were slop-fed, and the first prize litter owners used both systems. Whether the 1924 ton litter men will employ self-feeding or hand-feeding will depend largely upon the kind of feeds used, equipment, and personal preference. Good results may be secured by either method as long as the pigs are fed the right kinds of feed in proper proportions.

Self Feeders Can Be Used

Free choice self-feeding will prove satisfactory with such feeds as corn and tankage or corn and a mixture of tankage and linseed meal. Where barley is fed instead of corn, the pigs will often overeat on tankage. In this case, it is more economical to mix the barley and protein supplement in proper proportions.

Where dairy by-products are available, they will be a big factor in growing a ton of pork in six months. Good buttermilk is equal to skimmilk in feeding value, but care must be taken to feed it under sanitary conditions. Whey is also of value for the pigs, especially in combination with barley. For younger pigs a protein rich supplement, such as linseed meal or wheat middlings, should be added to the barley and whey. Where corn and whey are fed, these supplements should be supplied for pigs of all ages. Both the whey and buttermilk should always be pasteurized at the factory and creamery to prevent spread of tuberculosis and other diseases.

Tankage Furnishes Protein

Where no dairy by-products are available, the best protein rich supplement along with pasture is a mixture of half linseed meal and half tankage. On dry lot 10 per cent of this mixture in the ration for 100- to 150-pound pigs and six to eight per cent for pigs over 150 pounds will be sufficient. On good, leguminous pasture only about half as much of the tankage mixture is needed. On good protein rich pasture, wheat middlings are a good supplement for corn and barley.

For young pigs, oats are excellent as a part of the ration, but are bulky and high in fiber for fattening pigs. They should form no more than a third of the concentrate mixture.

Where tankage or dairy by-products are fed along with good pasture, no mineral supplement except common salt will be needed. Salt may be self-fed if care is taken to prevent over-eating at first. Otherwise it had best be mixed with the concentrate mixture, one-half pound to 100 pounds.

Pigs Must Have Minerals

Where there is likelihood of deficiencies in the mineral supply, free acess to one of the following home mixed combinations will prove valuable:

(1) Equal parts by weight of ground limestone and salt or equal parts wood ashes and salt.

(2) Equal parts of ground limestone, salt, and either bone meal or ground rock phosphate.

(3) Nine parts of either bone meal or ground rock phosphate and one part tankage for flavoring.

Another point often neglected is that of an ample water supply. Automatic waterers have been used by some feeders to save labor and insure enough drinks for the ton litter.

With these precautions taken to meet all the needs of the pigs for health, growth, and rapid gains, the fifty Badger ton litters will manufacture many tons of pork in the next few months.—H. J. BRANT, Swine Extension Specialist, Wisconsin College of Agriculture.

Matador Segis Walker

MATADOR Segis Walker, senior herd sire at the Carnation Milk Co. Washington Farm, and an outstanding sire in present day Holstein history, died July 16, a 10-year-old bull.

Matador was purchased by the Carnation Stock Farms with the Geo. V. Leighton herd in 1915 but was little used until 1918 because his value was not appreciated until his first daughters came to milk.

Since that time he has had heavy service and has had altogether about 500 offspring, 256 of them daughters. There are now 211 daughters in the Carnation herds and with the opportunity being given them it is reasonable to expect him to become a double century sire. He is already a century sire.

Because his heaviest service was during recent years, but 16 of the daughters of Matador Segis Walker have been tested at full age and 60 have made their records as 2-year-olds. Seventy-five of these daughters have 7-day records above 20 lbs. butter and ten have produced from 30 lbs. to 34 lbs. butter on short time test.

Twenty-six Matador daughters have finished year records that average 21,822 lbs. milk, 707.76 lbs. fat (884.7 lbs. butter), 16 of them making their records as two and three-year-old heifers with first calf.

Matador Hengerveld Bess stands at the head of the list with 26,667.7 lbs. milk, containing 1031.76 lbs. butterfat (1289.7 lbs. butter). Six others have produced in excess of 800 lbs. fat (1000 lbs. butter) and only seven of the twenty-six have less than 20,000 lbs. milk for their year's production. These seven, it should be explained, were all first calf heifers.

Nor is their producing ability the only outstanding characteristic of the offspring of this great sire. Twenty-six daughters and fifteen sons as well as granddaughters and grandsons have been prize winners at the Pacific International, the National Dairy Show, and our larger state fairs, these in addition to sons that have been winners at county and district fairs in many sections.

Still another credit to this bull, and it is an exceedingly important one, is the fact that the daughters of his sons are doing very well where given an opportunity to prove their worth. Twelve daughters of his first son, King Segis Matador Walker, produced an average of 4000 lbs. more milk than did their dams at the same age and under the same conditions.

Matador Segis Walker not only was given an exceptional opportunity but he deserved it.

Matador Segis Walker and Some of His Daughters

SEGIS DAISY FERN 2ND
Year's record: 21,913.5 lbs. milk, 668.33 lbs. fat (835.41 lbs. butter) as a 2-year-old.

MATADOR SEGIS WALKER
Twenty-six of his daughters have finished year's records that average 21,822 lbs. milk, 707.76 lbs. fat.

SEGIS CLOTHILDE EMMA
Year's record: 28,801.9 lbs. milk, 932.5 lbs. fat (1,165.63 lbs. butter). Matador's heaviest milking daughter to date.

MATADOR MECHTHILDE VERA
Year's record. 27,488.6 lbs. milk, 935.64 lbs. fat (1,169.55 lbs. butter).

MAY WALKER SKYLARK
Year's record: 21,621.3 lbs. milk, 725.57 lbs. fat (906.96 lbs. butter).

CARNATION LIZZIE SEGIS WALKER
Year's record: 24,171.7 lbs. milk, 807.66 lbs. fat (1,009.58 lbs. butter).

Menu for Dairy Lunch

HOARD'S DAIRYMAN:—I have been present at a couple of banquets given by different branches of the dairy industry, that have jarred my slow thinking apparatus loose and set it in motion again.

Summed up, is not our capacity, our zeal, our value in the dairy business, yes, our very business itself, measured by the estimate we ourselves place on the industry? Many reasons are advanced why we do not eat more cheese. One reason may be due to the fact that the members and officers of the Wisconsin Cheesemakers' Association and allied association are not sufficiently interested in their work.

It seems to me that the various associations are all working at cross purposes As a cheesemaker I know the antagonism that exists between the butter and cheesemakers of Wisconsin. As a cheesemaker I do not have a great deal of love for the hand separator. If we want to get the industry on a sound basis we want to all pull together to increase consumption of dairy products, whether it means increasing consumption of whole milk, butter, cheese, or ice cream.

At the banquet given by the Wisconsin Cheesemakers' Association last January, two small pieces of cheese were served, and while they were excellent, an opportunity was neglected that I wish to call to the attention of the members. Many people do not realize the excellent dishes that can be made from cheese, and a banquet of this kind should be made mostly of dairy products; meat has no rightful place on the bill of fare at a dairy banquet. Possibly it might cost more, but I am sure there would be no objection to paying more. Numberless people that do not attend would do so for the novelty, and if properly handled would result in a great deal of good for the industry.

Recently at the Hamilton Club, Chicago, I attended a luncheon known as the dairy lunch. Why it was given this name is beyond me as only one dairy dish was served and that was ice cream. The address of the day was given over to a discussion of the consumption of dairy products, and if that luncheon were to be taken as an example of the way to increase the consumption of dairy products, we had best shoot at the moon. Either the menu should be changed or else the name of the lunch. Something is radically wrong when the biggest men in the industry will allow a thing of this kind to be called a dairy lunch.

Here are a few suggestions for a dairy lunch:

Milk and cheese soup
Cream of tomato soup
Macaroni and cheese
Baked potato and cheese
Cheese cake A La Mode
Milk Cocoa
Blanc Mange Rice Pudding
Junket Buttermilk

During the war the cottage cheese propaganda led to interesting incidents. At one place where supposed sausage was served, a prominent chemist refused to believe it contained no meat. Only a practical demonstration of the preparation and cooking of the dish convinced him. An engineer who attended a cottage cheese exhibit remarked, "These things are fine; why did we have to wait till the war time to have good things to eat?" When such things can be done with cottage cheese, how much can be done in the preparation of a meal where we have the entire range of dairy products to choose from.

To quote S. K. Robinson:

"Cheese is made up of the solid components found in milk, chiefly the proteins and the fats. Protein is a muscle and tissue builder and also furnishes large amounts of energy. Fat is the best body fuel—an ounce of fat will supply about two and a quarter times as much heat as starch. These same fats and proteins are just as cheaply supplied through cheese as they are through milk. The reason is obvious, cheese is made in Wisconsin, the greatest dairy state in the Union, where milk can be obtained at a much lower price than it can be had in the city, and so to obtain the two most important constituents of milk, namely the butterfat and casein, cheese is just as cheap a source as is milk itself."

Illinois. C. R. BARKER.

Long and Short Leases

Some of the evils of tenancy seem to come from the short time the average tenant remains on one farm and some advocate long time leases. Leases of longer duration are desirable but they will be an outcome of stable farm conditions rather than a cause of them. When owners are holding land with a view of selling at a proft, rather than as a permanent investment, they do not favor long time leases. Rapidly changing agricultural conditions also cause tenants to hesitate to obligate themselves to certain conditions for a period of years. Equitable leases that may be renewed from time to time seem to more nearly meet the needs of the times than long term leases. At present few leases run for more than three years and usually they are for one year only and renewable if both parties are satisfied.—N. D. Bulletin 171.

Alfalfa Increases in Wisconsin

There are 217 thousand acres of alfalfa in Wisconsin as compared with 70 thousand acres in 1919 and 18 thousand acres in 1909. Not only has the acreage increased, but the season has been excellent in most alfalfa regions and an unusual crop is being harvested.

IN THE DAY'S WORK

"Get Yourself Examined"

ELWOOD ERICKSON, NEW YORK

THIS striking injunction has been used effectively by an association aiming to extend the life span of the average American citizen. They tell us that many of our ills can be avoided if we will take them in hand on time, that every now and then we ought to have a thorough overhauling of our physical apparatus. If our automobile develops a knock or a groan, we take up the matter instantly. But the most delicate piece of mechanism in the world, the human body, is allowed to take care of itself.

Their theory is preventive. Look over the machine for defects before they begin to develop and correct those defects. A little defect persisted in after awhile becomes a huge accumulation of defect, "The little rift within the lute by and by makes all the music mute."

This new therapeutics, the preventive treatment of ills, is now being applied to many other disorders as well as those of the body. Self examination is one of the first steps in character building. Character building is our biggest job. We are living in this little light patch between night and night for one purpose and that is that we may live out our human destiny in the noblest and worthiest manner. To fulfill that destiny, there are certain serious conditions which must be met. And one of them is the necessity of facing the facts about ourselves.

Many people are living in a fool's paradise regarding themselves. They blink at facts, refuse to meet them head on. Uncomfortably aware that everything may not be well with them, yet they wilfully shut their eyes and go along their disillusioned way.

Napoleon once said to Josephine, "Things that verge nigh, my simple Josephine, are not shoved off by willful blinking at. Better quiz evils with too strained an eye than have them leap from disregarded lairs."

There is no security in illusion. We might succeed in befuddling ourselves, but facts are facts, things are as they are and must so be met. A child who holds its hand over its own eyes and says you cannot see me, is no more mistaken than the man who deliberately ignores real things by blinding himself. We must meet these facts, pleasant or disagreeable, face to face and eye to eye.

With recognition there must follow decision. Here we meet another favorite weakness of human. We know that we are slipping a bit from the high standard that we have set for ourselves. Indeed we may be ready to confess that we are far astray but just wait a bit and we will straighten out all that in some near future. Most of us like this primrose path of dalliance. It is pleasant. Many of us indeed conclude that because we intend to do the thing, that it has been done, and are painfully surprised to learn later to our discomfiture that intention and achievement are two very different things.

Procrastination is one of man's most ruthless enemies. Good intentioned people live futile lives because they meant to but never did.

There is just one safe and sane way to overcome that pernicious thing and that is do it now. Go to the mat with the thing now. That little defect which is beginning to put up its head, clip it off now. The past is gone, we cannot correct that. The future is ahead, we are not able to prognosticate that. But the immediate, the present, is ours to do what we will.

It is not worth much to merely recognize defects. Some content themselves with that and spend the rest of their lives moaning over their hard fate. Philip Brooks had a bad lisp, He was told that he could never preach. They advised him to give it up and to try something else. He left that conference deeply depressed. But he did not spend the rest of his life lacerating himself because of his misfortune. He set out that day to correct it in so far as it was possible and became in later years one of the greatest preachers which this country ever produced.

Obituaries had been written or at least contemplated over Roosevelt during his college days. He had a weak and sickly body. When that warning came to him, he did not sit down under the weeping willows and wish that he were strong; he started to build up a physique which earned for him later the recognition of being one of the most physically strenuous presidents of our land.

The story of how men have overcome their limitations and handicaps is one of the most thrilling in all human annuals and all of them reveal the truth that recognition of the fact and decision to overcome it went hand in hand.

Get yourself examined. If there is something amiss you should know it. If you are slipping a bit, face up to it. And, facing it, go through with the thing.

MARSHALL OLMSTEAD, INDIANA, AND HIS 11 PURE-BRED DUROC-JERSEY PIGS THAT HE IS FEEDING IN THE HOOSIER TON-LITTER CONTEST

He is feeding them on corn, shorts, and milk and expects to let them out on rape and soy bean forage for finishing. Their dam is Olmstead's Wonder Maid III.

"E-B Spreader Cost nothing for Repairs"

The satisfactory service that the E-B Spreader gives makes their users write us enthusiastic approval similar to this letter from Erwin C. Sims, Melrose, Wisconsin:

"Three years ago I purchased an E-B No. 1 Spreader. Since that time I have spent nothing for repairs and I am very well pleased with the work of the machine and think it is a little better than any other machine I know of. It runs nearly as easy when spreading as when out of gear."

Is City Life Superior

Is it true that the comforts and conveniences of city homes lure the young people away from the farms? Perhaps the imaginary superiority may call a few of them but I still believe, as I always have, that very few go because city life looks attractive to them and they want to go; they go because they see promise of a better living than they can make in the country.

The class to whom these facts are applicable must necessarily be working people and they know they won't live in city mansions—most of them are fully aware that they will probably live in a flat upstairs—perhaps up more than one flight—and that they must manage with inconveniences and cramped quarters that would be unendurable in a farm home. Yet they submit to these hardships because they must live where a living can be made.

They can hardly be seeking superior social opportunity for it is a benighted rural section indeed, at the present time, that hasn't infinitely more of real sociability and fully as much culture and refinement as any city section has to offer a working man and his family. At a reception recently I talked with a farmer's wife who told me she was born and brought up in the city and most of her life had been spent there but she had never lived in any city that afforded anywhere near the opportunity for wholesome recreation and social good times that we have here. Yes, there are libraries, art galleries, etc., but we can go and look at the pictures, too, and a few books well-read are preferable to a million lightly sketched.

To return to the question of comfortable and convenient homes, is the average city home superior in either respect? My neighbor went to a luxurious city home in the South to spend the winter but she returned early in February because she was so cold and uncomfortable all the time. They had all the "comforts and conveniences" on the market in that place but no amount of money could coax comfort for an old lady out of a chilly gas fire. She longed for her big wood heater at home and returned to it in midwinter declaring that she hadn't been warm since she left it, though she took with her her own woolen blankets, wool comforts, feather mattress, and soapstone.

When my mother-in-law first moved to the city she didn't like it at all, and I must confess that I sympathize with her point of view. I should always hate the garbage can worse than poison and I never could like the idea of wrapping all the waste in a paper and saving it somewhere 'til some future opportunity of disposing of it instead of dumping it instantly into chicken feed or cow feed or putting it into a real honest-to-goodness stove where it would be promptly consumed.

No country housewife would think she could manage at all with the little box-like bedrooms lighted only by artificial means and found even in very good city apartments. If we had such a "box" we would use it for a grain bin or other storage purpose. The stuffy, hot, unventilated city rooms and even the foul-smelling city streets make the farm seem like heaven by contrast. I never go to the city that I don't breathe a sigh of relief "as long as a clothes line" when I am safely settled in the car ready for home, especially after we have left the heat and noise and confusion behind us.

Assuredly city women have running water; there is no other water to have, but nine times out of ten there is no such thing as a really cold drink such as we pump, fresh and sparkling from any farm well. Fuel is usually handier in the city but when the supply is low—as it is almost sure to be during the coldest weather when the need is greatest—people can neither cook nor keep warm. At home we never have to bake at midnight because our neighbors use so much of our wood all day we can't get any. A great many of us still burn kerosene lamps but we don't have to use a dim or uncertain light (or none at all) 'til after bedtime because the farmers around us are using so much of our oil. We build our fires and light our lamps when we want them and no meddler can make a leak or cross a wire off on the line somewhere that will cut off our supply of wood or kerosene; so for our inconveniences there are compensations.

Many of the things we pick freely from our own gardens and orchards can be obtained in the city only by going to the store and digging deep into our pockets to pay for them and, even then, the quality is often so inferior we hardly recognize them. Here we milk our own cows and use all we want of the milk, butter, and cream; and it doesn't give us scarlet fever or hydrophobia either. Perhaps the city may be the place to make money but the country is certainly the place to live and bring up healthy, happy children.

New York. (MRS.) E. M. ANDERSON.

Solid or Plated

No matter how hard times are, a bride always thinks longingly of solid silver for her table. Aside from any other advantage, "sterling silver" has such a lovely sound and in many cases that is the most there is to it.

Manufacturers of silver today are making the bride's decision much easier than it used to be. Time was when solid silver was made up in just certain patterns and the plated in distinctly different ones. Anyone who knew silverware at all could tell the difference at a glance.

Nowdays it is possible to get the same pattern in both solid and plated ware and it is a boon to those of us who must economize and yet who have a longing for lovely things. I don't mean that all patterns are made up both ways, but several of the very good ones are and it takes very careful inspection to tell which is which. Then there are a few solid and plated patterns which are so near alike that when a table is laid with the two, the difference is not seen. It is worth while, if you are getting some of both kinds, to try to get such patterns as these.

I don't mind other plated things, but, like a dear old lady I know, "I do like my teaspoons solid." It is the knives and forks anyway, that are most fearfully expensive in the sterling and, to me, are least noticeable. The plated ware of today is so well made that I think any young couple would do well to investigate it thoroughly before putting much money into the other kind.—LUCY THOMPSON.

The Summer Set-up of the Furnace

If you are one of those persons fortunate enough to have a good furnace remember that summer is the time for its annual physical examination; such things need them just as people do.

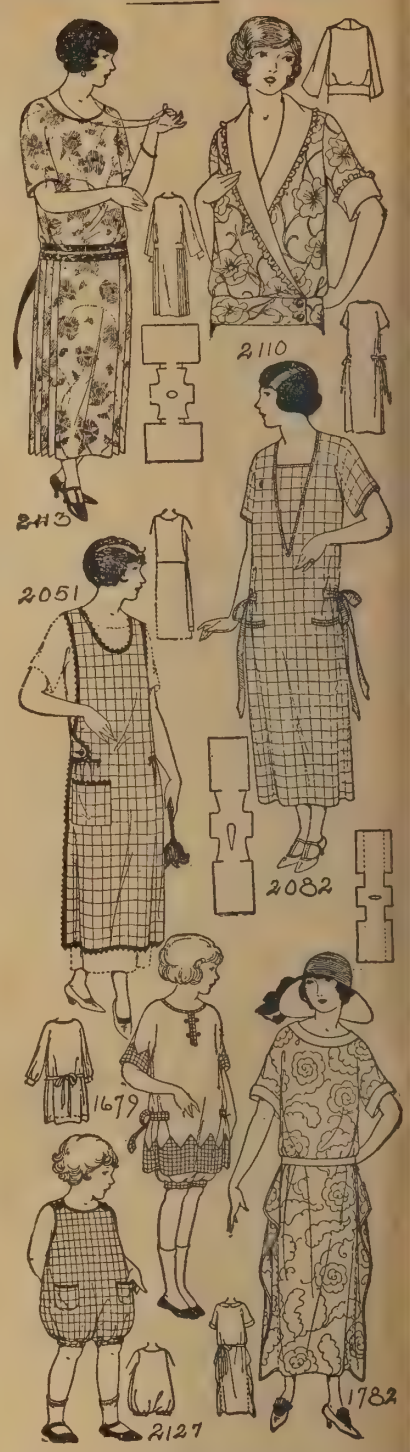
All pipes should be cleaned out carefully and freed not only from soot but from the fine ash that often gets into them. Grates and drafts should be tested and everything made ready for the first blasts of winter—a thing we are all shuddering at the thought of because in our part of the country we feel that we haven't seen summer yet and it looks as if the frost would catch some of the crops. But we'll just hope and do the best we can about the things we can't control.

Most all furnaces have some sort of device for supplying moisture to the air. In a hot air plant it is a water container set into the jacket that surrounds the furnace and never yet have I seen one that was ample.

The more doctors study colds, the more they find that a great many of them are due to the fact that most of us spend our winters in air that is too dry. If you have ever lived in a house with the proper humidity you will have no difficulty in sensing a change to one that is harmfully dry.

Investigate the matter this summer and see if it is necessary to put in another water pan. The total cost of a good-sized one can be kept under five dollars, I believe; considerably under if one of your men does the work, as he easily can.

If you have got water or steam heat the task of humidifying the air is much simpler and more effective. There are shallow pans made purposely for such radiators. These are set under the radiator and a wick arrangement placed in the pan extending up between the coils. When the pans are kept full of water there is a very satisfactory evaporation.



Where there are children it is better to have pans that set on top of the radiators. These, of course, have no wicks and many of them are quite decorative.

If we neglect these things till winter comes we are apt to say, "O, well, we'll get along until Christmas," and after that we say, "Spring is nearly here and we'll wait and do it later." But the heartening feeling that the furnace is ready and "rarin' to go" when the first cold day comes will pay you for all your efforts right now.—LUCY THOMPSON.

Fashion Magazine

From the front cover of our Spring and Summer Fashion Magazine right on through the book, you will see all of the styles which will be popular during the coming season. Styles for morning and afternoon wear as well as those needed for the more formal occasions. And cute styles for the kiddies. There are dressmaking lessons for the beginner, and charming styles which can be made in a couple of hours even by one who is a novice with the needle. Also photos of the most popular Broadway, New York, actresses. So settle your dress problems by sending 10c today for our new Fashion Magazine. You'll save dollars by doing so. Address Fashion Department, Hoard's Dairyman, Fort Atkinson.

Miscellaneous Fashions

No. 2113—One-Piece Dress. The accompanying diagram of which explains simple construction. Cut in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 requires 3 yards 40-inch material with 1½ yards of binding and 3¾ yards of ribbon.

No. 2110—Pretty Blouse Style, the pattern for which cut in sizes 16 years, 36, 38, 40, 42 and 44 inches bust measure. Size 36 takes 2⅛ yards of 36-inch material with 1 yard 20-inch contrasting.

No. 2082—One-Piece Dress (see diagram). Gingham, cretonne or muslin would be nice made after this style for morning wear. In softer wash cottons and summer silks it would make a pretty afternoon dress. Cut in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 requires 3⅜ yards of 36-inch material with 4 yards ribbon and 3½ yards binding.

No. 2051—One-Piece Apron. Cut in sizes small, medium, and large. The medium size takes 2 yards of 36-inch material with 7 yards of trimming.

No. 1679—Cunning Bloomer Dress. Cut in sizes 2, 4, 6, and 8 years. Size 36 requires 2⅛ yards 36-inch material with ¾ yard 36-inch contrasting.

No. 2127—Play Romper. Cut in sizes 1, 2 and 3 years. Size 2 takes 1⅝ yards of 36-inch material.

No. 1782—One-Piece Dress, the accompanying diagram of which shows dress opened out before any seams are taken, you see the entire dress cuts in one piece. Cut in sizes small, medium, and large. The medium size takes 2⅞ yards of 36-inch material with ⅝ yard 36-inch contrasting.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Farmers and Politicians

HOARD'S DAIRYMAN:—In reading the letter of H. Schroeter of Wisconsin in July 11th issue, the thing that strikes me as amusing is that the farmers want higher prices for their products and lower prices for what they have to buy and the laborer wants higher wages and lower prices for what he has to buy and there are politicians who promise to bring all this about.

It would seem apparent to a ten-year-old child that if the farmer gets more for his produce, the cost of the laborer's living must go up proportionately and if the freight and machinery the farmer buys are lowered, the laborers' wage must go down; that if wages are raised the things the farmer buys will cost more, and if the cost of living of the laborer is lowered the commodities produced by the farmer will bring less.

Candidates will go into the West and promise the farmers the one thing and into the manufacturing and mining districts and promise the laborers the other. When elected these promises are empty because physically impossible of achievement.

There is too much talk of this class and that class when the only class entitled to any consideration whatever is the American class.

In national and state governments there are too many departments, bureaus, commissions, etc., mostly designed for the purpose of creating jobs and spending money. I doubt if one in ten of these bureaus, etc., accomplish enough good to offset the maintenance expenses, yet the American people continue to suffer them to be imposed on them, the paying part especially.

It is my opinion that this government could be carried on for one-half the present expense or even less.

A few years ago a Democrat was running for governor in Ohio. He pointed to the increased expense under Republican administration and of course promised to reduce it. He was elected. More bureaus were created, so many that one of the largest office buildings in Columbus was leased to house them and parts of other buildings. The next election these buildings and their rental and increased job holders and expenses were listed in the Republican campaign book. Cost of government in Ohio had increased 25 or 50 per cent. A reduction would be made by the Republican if elected. Oh, yes, sure he was elected. And the next election came around and instead of a reduction the cost of government had still further increased. And so it goes. More bureaus, more commissions, more job holders, more expenses, and more taxes and no perceptible increased benefit of government that I can see or that I have ever had pointed out to me.

On top of this are new lodges, clubs, associations, etc., started right and left, started mostly by people who like to spend other people's money, and the "Brotherhood of Jiners" bite on this the same as on the office seeker's bait, and in the end they get the hook.

The immutable law of supply and demand will take care of the farmers and the workingmen and all other Americans as well, if hindered as little as possible by government, and allowed to proceed without combinations to boost the prices of labor, materials, and commodities unnaturally.

This country grew to be the greatest on earth without these numerous bureaus, job holders, etc., and I am sure we would all survive if three-fourths to nine-tenths of them were dispensed with at once and the money saved diverted to some useful purpose. Maybe I am wrong but these numerous bureaus and job holders are a sign of degeneracy to me.

Ohio. J. W. GREENFIELD.

Tries To Pull Ideas

HOARD'S DAIRYMAN:—It is quite amusing to watch the antics of New York Teat Puller as he tries, on page 826, to pull ideas. His question No. 4, "What will the members have to show for their share in these plants after the certificates of indebtedness are paid?" illustrates my point.

He may be a success at pulling teats, but if his intellect were developed to the point of a normal ten-year-old child he could see that the members will have in their hands a lot of Uncle Sam's good dollars, the best money in the world.

The rest of his questions are about on a par with No. 4. The group of producers that supplies any market with milk is constantly changing from year to year. After the first five years under the revolving fund plan, ownership of the plants keeps changing from year to year from those who retire as producers, through death or otherwise, to those who take their places.

New York. O. W. MAPES.

A Satisfied Australian

HOARD'S DAIRYMAN:—Let me introduce myself as a satisfied subscriber from Australia. No doubt there are many more like me over here. I am a dairy farmer in the Lakes District of South Australia, and first got in touch with your instructive paper through noticing paragraphs in Australian papers which were acknowledged as copied from Hoard's Dairyman.

I don't know how many Australian subscribers you have, but my neighbors, to whom I pass on my copies, are full of praise as to its many virtues and I think you could get rid of quite a pile of papers each mail.

I am interested in Guernsey cattle, though far from being an expert. I am going to try to do my best with a pure-bred bull which I recently got from the government. I have at present twenty-two cows and hold 531¾ acres of land, described as generally level, part red loam over limestone, part sandy with stony out-crops (limestone), Yarra, rusher, herbage, and grass timbered in part with mallie and shwak; water within 8 to 10 feet of surface; a large area of good lucern land, parts are good land for barley, oats, and wheat. Rainfall about 20 inches (last year 22 inches).

Cows in this district spend their whole life out on pasture, are never rugged, and are left to calve on the grass. Naturally we seldom have cause for anxiety through sickness.

May your paper ever continue to prosper and carry on the good work, and yourself blessed with health and strength to lend a guiding hand.

So. Carolina. A. L. BETTERIDGE.

In the Bell System laboratories speech sounds are recorded on the oscillograph with a view to their subsequent analysis.

The service of knowledge

The youthful Alexander Graham Bell, in 1875, was explaining one of his experiments to the American scientist, Joseph Henry. He expressed the belief that he did not have the necessary electrical knowledge to develop it.

"Get it," was the laconic advice.

During this search for knowledge came the discovery that was to be of such incalculable value to mankind.

The search for knowledge in whatever field it might lie has made possible America's supremacy in the art of the telephone.

Many times, in making a national telephone service a reality, this centralized search for knowledge has overcome engineering difficulties and removed scientific limitations that threatened to hamper the development of speech transmission. It is still making available for all the Bell companies inventions and improvements in every type of telephone mechanism.

This service of the parent company to its associates, as well as the advice and assistance given in operating, financial and legal matters, enables each company in the Bell System to render a telephone service infinitely cheaper and better than it could as an unrelated local unit.

This service of the parent company has saved hundreds of millions of dollars in first cost of Bell System telephone plant and tens of millions in annual operating expense—of which the public is enjoying the benefits.

FITS ANY PUMP AND MAKES IT HUMP

FULLER & JOHNSON ENGINES

The Producer's Part in Getting Good Quality

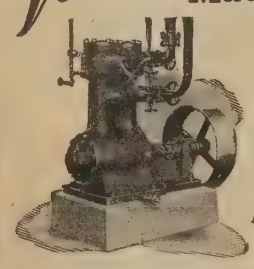
Sell good quality cream. Feed and house cows properly. Watch rations closely. Be sure your stable conditions are right. Handle your milk and cream under the most sanitary conditions. Discard all rusty receptacles. Keep the cans sterilized. Sell your cream while it is sweet.

There is more in the dairy business for you if you carefully follow these practices. The cream buyer wants quality and the manufacturer of butter must have quality because a large percentage of the consuming public demand quality. Quality begins with production, and

Quality Always Commands the Better Price

In egg production, feeding and housing are as important as in the dairy business. Keep the nests clean. Gather the eggs frequently and after they are gathered keep them in a cool, dry place. Prevent the hens from stealing nests.

Sort the eggs properly so that the good and inferior eggs shall not be mixed together. Keep the small, thin-shelled and dirty eggs separate from the good ones. Consume them at home, if possible. The only way to get the top price is to furnish uniform size, color and quality eggs. A few undergrade eggs in a lot of good ones will pull the quality standard down as surely as a rotten apple will spoil all the rest in the barrel.



Sell according to quality and grade, and get the better price.

DAIRY MARKET NEWS

1923 Prices for Pure-breds

According to a recent U. S. government report, average sale prices for pure-bred dairy cattle for 1923 range from $133 for bulls under a year old to $268 for bulls over 3 years old. More than twice as many animals were disposed of at private sale as at public auction. Auction prices, however, averaged from $25 to $50 per head higher than those for private sales. Aged bulls were the exception to this, such animals bringing more at private sale.

The figures below give a comparison of 1922 and 1923 for all breeds at both public and private sales:

	1922	1923
Bulls under 1 year	$156	$133
Bulls 1 year and under 3 years	221	206
Bulls over 3 years old	435	286
Heifers under 1 year	131	133
Heifers 1 year old and under 3 years	211	229
Cows over 3 years of age	285	261

These figures are from reports submitted by breeders to the U. S. Dept. of Agriculture. The number of animals represented are: Calves under one year of age, 4,845; bulls over one year and under three, 947; bulls over three years, 156; heifers over one year and under three, 2,479; cows over three years of age, 2,977.

Butter Markets

(Report by U. S. Dept. of Agr.)

Butter markets unsettled and irregular during the week ending July 26. Current demand not sufficient to absorb current receipts, with result that price declines occurred. Heavy into storage movement continues, and July increase bids fair to exceed June. Production still heavy. Import situation unimportant.

The average wholesale prices on 92-score butter for the week ending July 26, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending July 26 1924	July 19 1924	July 26 1923
	Cts.	Cts.	Cts.
New York	38.7	40.8	41.4
Chicago	36.7	38.3	39.5
Philadelphia	39.6	41.5	42.0
Boston	39.1	40.5	41.1
San Francisco	38.9	41.1	42.8

The receipts of butter at these markets were 20,469,097 lbs. for the week as compared with 21,481,947 lbs. for last week and 16,429,068 lbs. a year ago.

League Pool Price for June

The Dairymen's League Co-operative Association's gross pool price for 3 per cent milk at the 201—210-mile freight zone for June is $1.42 per 100 pounds, with deductions of $.08 for expenses and $.10 for certificates of indebtedness. The net pool price, therefore, is $1.34 and the cash distribution is $1.24.—F. A. HOAR.

Cheese Markets

(Report by U. S. Dept. of Agr.)

Cheese markets were firm. Very active demand at principal markets, with buying for storage purposes an important feature of trading. Production outlook good.

The average wholesale prices on American cheese, style Twins, for the week ending July 26, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending July 26 1924	July 19 1924	July 26 1923
	Cts.	Cts.	Cts.
New York	20.7	20.7	25.5
Chicago	18.1	17.7	21.8
Boston	21.2	21.4	25.2
San Francisco	19.0	20.5	23.6
Wisconsin Boards	17.9	17.6	21.2

The receipts of cheese at these markets were 5,360,738 lbs. for the week as compared with 5,623,703 lbs. last week and 5,676,924 lbs. a year ago.

MILWAUKEE, Aug. 4—Butter—Creamery, extra, tubs, 36c; standards, 35½c; extra firsts, tubs, 34@35c; firsts, 32@33c; seconds, 30@31c.

Eggs—Fresh gathered firsts (new cases), including cases, candled, 27½@28c; ordinary firsts (standard cases), 26½@27c; miscellaneous lots, shippers' cases returned, candled, 23@25c; seconds, dirties, 20@21c; checks, 20@21c.

Cheese—American full cream, Twins, 18@18½c; Young Americas, 18½@19c; Longhorns, 19@19½c; Daisies, single, 18½@19c; American, 32c; Pimento, 34c; Swiss, 42c; special market Brick, fancy, 15½@16c; Limburger, new, 18@19c; imported, Swiss, loaf, 42@47c.

NEW YORK, Aug. 4—Cheese—Steady; state milk, common to specials, 15@21½c; skims, common to specials, 11@12c; lower grades, 4@10c.

Butter—Firm; receipts, 9,443 pkgs.; creamery, extra, 37½c; special market, 38@38½c.

Eggs—Quiet; receipts, 11,388 cases; nearby white fancy uncandled, 46@48c; nearby brown and mixed, 37@44c; fresh first to extra, 29@36c; Pacific coast, 37@45c; western whites, first to extra, 30@45c; nearby state white, 30@45c.

CHICAGO, Aug. 4—Butter—Receipts, 18,407 pkgs.; creamery extras, 35½c; standards, 35½c; dairy, firsts, 33@34c; seconds, 32@32½c.

Eggs—Receipts, 20,032 cases; ordinary, 26@26½c; firsts, 27@28c.

Cheese—Twins, 19¼c; Young Americas, 20@20¼c.

FOND DU LAC, Wis., Aug. 2—Average cheese prices (majority of sales), f. o. b. shipping point: Twins, 18½c; single Daisies, 19c; double Daisies, 18¾c; Longhorns, 19c; square prints, 19¼c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Aug. 2: Single Daisies, 18¼c. On Farmers' Call Board, Aug. 2: Twins, 18½c; single Daisies, 18c; Young Americas, 18c; Longhorns, 18c; square prints, 18½c.

National Dairy Exposition

Dairy Show time is advancing rapidly and within a few days the annual hegira of the National Dairy Association will be under way.

The office of the Association was transferred to Milwaukee, the host to the Dairy Exposition this fall, on July 28th, and all mail, telegrams, and queries should be sent to that city. The complete address will be Room 414, Carpenter Building, Grand Avenue and Sixth Street, Milwaukee, Wis. —W. E. SKINNER, Gen. Manager.

Cow Testing Associations

(Continued from page 77)

keep up the good work of the spring. is getting the same results from a change of pasture.—C. E. Snell.

Blue Earth Co. No. 2, Minn.: This association finished testing in June with 315 cows, 108 of these producing 40 or more pounds fat, 6 over 60 lbs., and 27 over 50 lbs. The average production of the association was 920 lbs. milk, 35.8 lbs. fat. High herd, composed of 14 grade and pure-bred Holsteins, averaged 1,172 lbs. milk, 45.42 lbs. fat. They are owned by John Fasnacht. The tuberculin test found one reactor. The remaining 4 applications for the test were filed this month, which will make this association 100 per cent in this respect. Testing for T. B. is quite active in this vicinity and petitions are out for the signature of 51 per cent of the farmers, which will make it compulsory to the others. One lighting plant and electric milker were purchased by a member. One new modern dairy barn is under construction and several are being remodeled.—O. E. Erickson.

Culver, Ind.: The 366 cows tested in June averaged 823 lbs. milk, 31.5 lbs. fat; average profit, $15.60. The 10 high cows averaged 1,998.6 lbs. milk, 76.3 lbs. fat. Eighty-four cows produced over 40 lbs. fat. A record worthy of mention was made by a two-year-old grade Holstein owned by W. O. Osborn, 1,410 lbs. milk, 76.1 lbs. fat. Market milk sold for $2.40 per cwt. The cheese factory paid $1.40 per cwt. for 3.5 per cent milk. Sweet cream brought 38 cents per lb. for fat; sour cream, 35 cents. Milk retailed for 10 cents per quart; butter, 42 cents per lb.—W. R. Matthews.

Linn Co. No. 2, Ia.: This association has been in operation one year, with an average production of 7,140.4 lbs. milk, 290.4 lbs. fat. F. E. Breneman's Jerseys headed the association with an average of 392 lbs. fat. A contrast between the average of the 5 high herds and the 5 low herds is shown as follows: The high herd average was 369.2 lbs. fat; value of product, $262.06; cost of feed, $95.99; profit above cost of feed, $166.07. The low herd average was 233.8 lbs. fat; value of product, $166.78; cost of feed, $65.46; profit above cost of feed, $101.31. The ten herds that these figures were taken from contain over 100 cows and about equal numbers in the high herds and low herds. The value of product was figured from the average price paid by the distributors of Cedar Rapids during the association year. This proves the same thing that has been proven every year, that the high producing cow is the most economical producer. The high herds averaged $64.76 more profit than the low herds. On 10 cows, the average number in these herds, the difference would be $647.60, and the difference in the amount of labor was practically none, if any.—C. J. Moore.

Fayette No. 1, Ia.: A few members feed grain. Several new silos are up and more will be erected this fall. Some of the barns will be remodeled and repaired.—C. White.

North Eaton, Mich.: Fifteen out of the 28 members fed grain and 2 fed hay on insufficient pasture. Pasture has been exceptionally good this spring and summer, but there has been an acute shortage of grain. Eight members either purchased or went without grain last spring. The condensery paid $1.55 per cwt. for milk; the cream station, 40 cents per lb. for fat. Milk retailed for 9 cents per quart.—H. E. Frank.

South Eaton, Mich.: This association has just started on its third year's work with 23 of the old members. High herd of 7 pure-bred Holsteins, belonging to C. E. Burke, averaged 14,472 lbs. milk, 513.6 lbs. fat. The average of all the cows in the association was 7,654 lbs. milk, 286.7 lbs. fat.—H. Kardel.

Clintonville, Wis.: One barn was whitewashed and another is being remodeled and cement floor put in. Large crops of alfalfa are being harvested. The condensery paid $1.80 per cwt. for milk; the cheese factory, $1.64. Milk retailed for 9—12 cents per quart butter, 50—55 cents per lb.—A. S. Peterson.

North Gratiot, Mich.: The average production of the 222 cows tested in June was 714.9 lbs. milk, 29.9 lbs. fat. This is a gain of 1.6 lbs. fat per cow over May production. Forty-nine cows produced over 40 lbs. fat, 14 over 50 lbs., and 4 over 60 lbs. Two herds averaged above 40 lbs. fat. All but 4 of the 26 members feed grain on pasture. One faulty separator was replaced by a new one. The condensery paid $1.45 per cwt. for milk; the creamery, 44 cents per lb. for fat.—C. H. Blivin.

Northwest Wisconsin

The future of cow testing association work has never looked more promising than at the present time. This, however, may be attributed largely to the fact that the dairy farmer has come to realize that it is not only necessary to have cows with records to sell them most profitably, but that cow testing association records are also necessary as an aid to him in feeding his cows with greater economy. The greater demand for associations to be organized on the single herd plan enabling the tester to render a greater service to the individual members, the increasing interest in the value of re-test work, the adoption of rules restricting the publication of records, the tester's printed annual report as a means of bringing out the value of continuous testing, and the adoption of a uniform test-period system, are all factors upon which we are basing our hopes for a greater future in cow testing association work.—ERWIN SUTTON, Fieldman for Northwest Wisconsin.

PENNSYLVANIA TESTERS MEET

The Pennsylvania Association of Testers was formed last June with A. A. Raudabaugh as president, John Smeltzer as vice-president, and C. R. Gearhart as secretary-treasurer. One state-wide and four sectional meetings will be held each year to further the interest of cow testing association work.

From Macomb County, Michigan

The annual report of the Macomb County Cow Testing Association, No. 2, shows that all members are either owning or using pure-bred sires. Three high class sires were purchased during the year and are being used in neighborhood rings.

The C. T. A. members are growing more alfalfa and sweet clover. In May, 1923, when this association began operations, 50 acres of alfalfa were grown on 29 farms. In May, 1924, 210 acres are reported seeded to alfalfa on these 29 farms. In May, 1923, not one acre of sweet clover was being grown. In May, 1924, 155 acres are reported seeded to sweet clover.

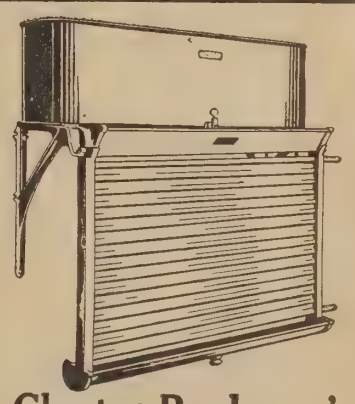
Howard Smith had high herd in fat and milk production and also high cow in fat production. Fifteen herds averaged above 300 lbs. butterfat. Forty cows produced over 10,000 pounds milk and 143 cows produced above 300 pounds fat.—CASPER BLUMER, Tester.

McGavock Plantation Home, Nashville, Tennessee

65 Years of Painting

The farm home shown above was first painted with White Lead in Oil, mixed on the place, in 1859. Since that time, it has been continuously and regularly painted with White Lead in Oil. Like many another, the present owner, who was born on the place, for many years specified White Lead in Oil—without indicating *what kind* of White Lead in Oil. But for the last twenty years he has ordered EAGLE White Lead in Oil, because he found that Eagle White Lead in Oil best protected his property for the longest period.

Send for the Farmers' Eagle



The Farmers' Eagle is a complete guide for painting on the farm. It was written by a man who grew up on the farm. It was submitted, before publication, to practical farmers who know the use of paint on farms. It will be sent free upon receipt of coupon below.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Judging Dairy Cows

Many of you boys and girls are taking part in dairy cattle judging contests. Whether or not you are entering a contest, every Hoard's Dairyman Junior should know some of the chief points to be considered in picking out a good cow. Only by constant selection will our breeds of dairy cattle continue to improve.

We know the final judgment of a good dairy cow depends on her answer to the question—will she fill the milk pail? This can only be accurately determined by means of the milk scales and the fat test. A cow may make ever so fine an appearance and still not do her duty at the milk pail. Or, she may be a poor looker but a good milker. Looks and producing ability do, however, bear quite a little relation to one another, and it is with this ever in mind that we will discuss briefly the judging of dairy cows.

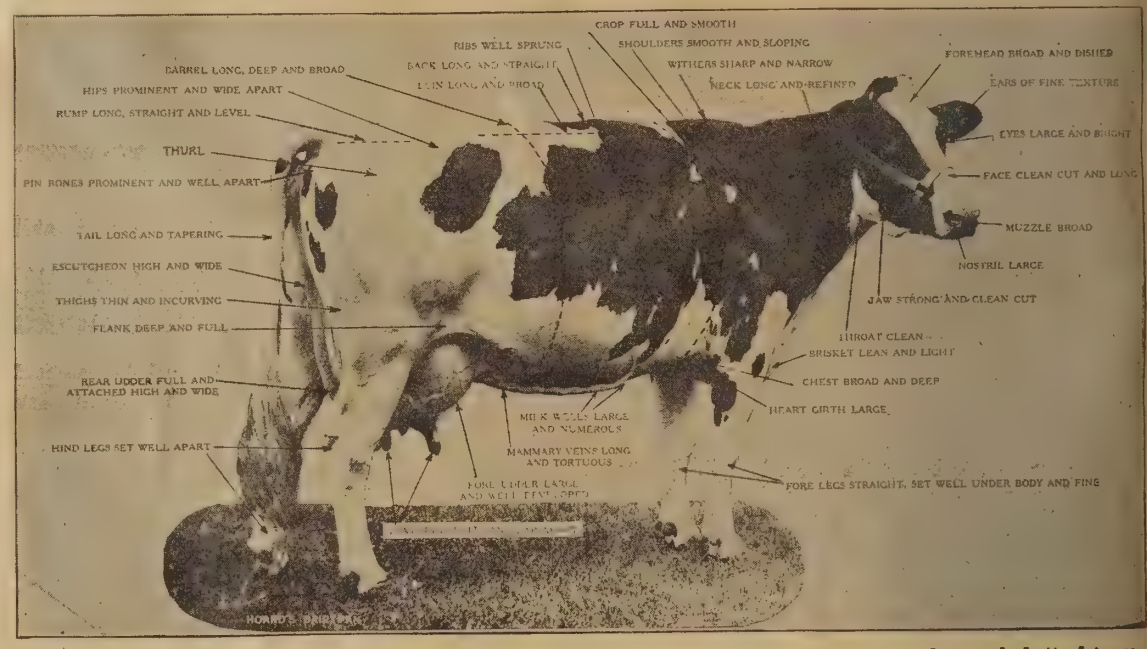
To become well grounded in the fundamentals of judging, a score card is very useful. It tells you what to look for and what value to place on each point. Each of the five dairy breed associations has a score card for both cows and bulls of their breed, and will be glad to send them to you on request. Likewise, you can obtain score cards for dairy cattle from many agricultural colleges.

In the main, however, the general features of all are similar. Let us consider the main divisions under five heads: type, feed capacity, constitution, dairy temperament, and milk organs.

If you have ever watched a judge at work in the show ring, you have noticed that the first thing he does is to take a long distance view of the animals as they are led before him. General impressions help to roughly place the animals in his mind. He is constantly comparing the best cows, weighing the good points of one against the good points of the other. He later confirms his first judgments by handling the animals. Often when he comes to examine the milk organs, if the class before him is in milk, he will milk a few streams, thus trying out the cow's milking ability.

Type. Is the cow a good representative of her breed? This is an important question to answer in considering type. Is she typical of the best?

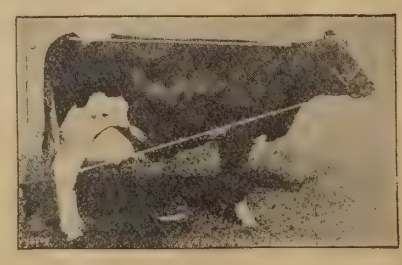
Feed Capacity. The cow is a wonderful machine. She is like a factory, manufacturing from the raw products of the fields a health giving fluid, milk. A cow to be a good producer must, therefore, have a big feed basket. This means that she will have a broad muzzle, and a deep, long, and well-rounded barrel. By referring to the diagram on this page frequently, you will get a clear understanding of the terms used in this article. You should all be familiar with the different parts of a cow.



Constitution. This includes everything which applies to signs of health and long life. It means that the cow will have large open nostrils, giving a large intake of air, that she will have a good circulatory system, that she shows other signs of being able to keep well and maintain good production. Her chest should be roomy, her eyes bright, her skin pliable, hair of fine texture. You can determine the pliability of the skin by grabbing a handful just behind the shoulder.

An important part of the cow's circulatory system are the veins on the face, udder, and under part of the body. The former should be prominent and the last mentioned—often called milk or mammary veins—should be large, long, crooked, and branching. The milk wells, see illustration, should be large and numerous. The milk veins carry blood and indicate that the udder is well supplied with blood.

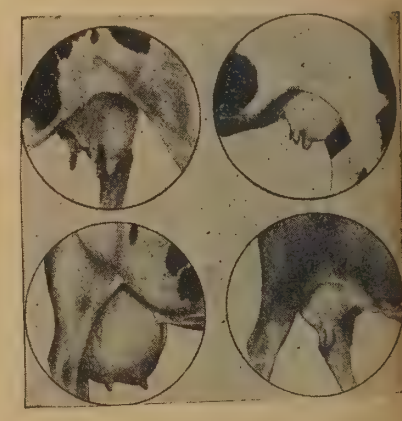
Dairy Temperament. When we asked a well known dairy judge what was meant by "dairy temperament" he gave this answer—"Dairy temperament is that appearance of a cow which leads you to believe that she is a good producer." This means that the cow tends to be angular, her hip bones prominent, and that there is plenty of space between her ribs. A good dairy man once told us if he could see only one part of a dairy cow he could tell more by looking at her head than any other part. Good producers show a certain quality and refinement in the head which is very helpful in determining dairy temperament.



Milk Organs. The udder is perhaps the most important single part of a dairy cow's anatomy, because it is here that she produces her milk. On most score cards the udder is given more points than any other part. Here is a description of the milk organs which may help you. The udder should be well forward, full in front, full and well extended in back, evenly joined, and well held up to the body. The teats should be well apart, squarely placed, of good and even size. The rump should be long, wide, and level; thighs wide apart, the twist high and open. You can tell quite a little about the quality of the udder by feeling it. It should be neither hard nor meaty but should be soft and give to the touch.

The illustrations on this page were supplied by the Wisconsin College of Agriculture and should help you in picturing a good dairy cow and fix well in your mind the ideals in conformation for such.

Do you know the parts of a dairy cow? Duchess Skylark Ormsby was a former champion cow for yearly butterfat production, record 27,761.7 lbs. milk and 1,205.9 lbs. butterfat. She showed excellence in all parts.



Here are three wedges that can be seen on a good dairy cow. In the upper picture both wedges have a common apex, the top of the shoulders. The third wedge is seen from the side as in the lower picture.

Do these two udder pictures compare favorably with the written description? There should be plenty of loose skin behind after the udder is milked out (lower picture).

These four udders wouldn't score very high in the show ring. They illustrate *undesirable types.*

This man is showing you the location of the milk wells, little depressions, sometimes as big as one of your finger tips, where the milk veins enter the body. The number of milk wells varies from two to fourteen.

Would You Like a Radio Set?

Of course you want a radio set in your home this fall and winter so that you can listen to all the speeches, music weather reports, latest news, and entertainments of all kinds.

How can you get a radio! Let me whisper in your ear. Do you want it hard enough so that you'd be willing to work for me? It isn't hard work either. If you'll just get a post card (or write me a letter) and say, "I want a radio set." I'll tell you all about it. Do it today. My address is—The Radio Man, care Hoard's Dairyman, Fort Akinson, Wis.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

Starting with two pure-bred Jersey heifers twenty years ago, the New York Experiment Station has developed a profitable herd of twenty-six pure-bred cows from twenty-four cows of irregular breedng. In doing this they followed methods which are within the means of almost all ordinary dairy farmers. For this reason the first article appearing in the August 1st issue of Hoard's Dairyman, in A. C. Dalberg's series, is of particular interest. The New York herd at Geneva is probably the only experiment station herd in America that keeps no other breed of dairy cattle than Jerseys.

When were the first cows brought to the experiment station? Four Jersey cows arrived on November 30th, 1882. In later years Holsteins, Devons, Alderness, and Shorthorns were obtained to use in a big breeding test which ended in the 90's.

Why was one breed chosen? Because of the considerable expense involved in maintaining several breeds. And because it was desired to have a fairly uniform herd for experimental purposes. Therefore, a Jersey sire was placed at the head of the herd in 1901.

How can a pure-bred herd of dairy cattle be obtained? There are but two methods—buy them or raise them. Because the expense of purchasing enough well bred females to fill a barn built for twenty-six milk cows is probably not within the means of the average farmer, it was decided to adopt the second method.

Explain the development of the station herd. The two foundation cows, Dotshome Carey and Milly Darling, were purchased as bred heifers in 1900 from a New York Jersey breeder for $250. Milly Darling has an average of about 375 lbs. of fat for each year of her lifetime and her running mate produced about 50 lbs. less per year. All the females in the herd today with the exception of one heifer are descendants of these two cows. This herd is a product of the bulls used during the past twenty years.

Tell about the purchase of bull calves. The herd sires were generally purchased as calves from New York breeders. In every case the breeder's herd was visited some time before the bull calf was needed. If the animals in the herd were the large American type Jersey, good producers, and free from tuberculosis, a calf was later purchased by mail.

Name three commonly mentioned objections to sweet clover. (1) The cows will not eat it readily. (2) Sweet clover sometimes causes bloat. (3) It occasionally taints the milk. (See W. J. Fraser's article).

How have these objections been answered? It is the opinion of eighty-one dairymen that (1) cows turned onto sweet clover when it is young will relish it after the first two or three days, that (2) trouble from bloat on sweet clover pasture can be avoided if cows are given access to a little dry roughage, salt, and water, and that (3) the same precautions will prevent tainted milk.

What suggestions for "Milk Marketing in New England" has Alexander E. Cance to offer? That the responsible heads of the various milk organizations in New England come together at regular times to discuss their marketing problems in a friendly way. Such an organization may be easily, cheaply, and quickly formed; takes nothing away from existing organizations; gives due weight to all of them; and could have representatives from unorganized groups.

SOUND VALUE

Sound products evolve from sound principles.

Dodge Brothers Motor Car is the product of an institution whose principles have always been conceded to be pre-eminently sound.

Sound manufacturing methods that place infinitely more importance on quality than quantity—

Sound financial standing, which permits uninterrupted development and adherence to the policy of constant improvement—

A sound method of selecting dealers, from which an organization has grown that enjoys the complete confidence of the public—

A sound sales and service policy, through which buyers are assured full value for their investment—

These basic principles being sound, it follows as an obvious consequence that Dodge Brothers Motor Car represents sound value.

Junior Letter

Father Owns Championship Cows

Hoard's Dairyman Juniors:—I have finished my first year of high school. My agricultural teacher at high school is working up a testing association. Father has entered eleven cows. He hopes to enter several more as soon as they are fresh. Three of the eleven are registered pure blood stock. One of the cows which is to be entered is a heifer out of one of the pure cows.

One of the cows which is registered won the championship of the state of Arkansas as a two-year-old and was re-entered and won again as a four-year-old. Her name is "Katie of the Elms".

Another of the registered cows won the championship of Arkansas as a three-year-old. Her name is Financila Odello's Martha. She has been re-entered and has almost won the championship for this year. She got one of her horns knocked off.

Here is a riddle for you: 10, 5, 18, 19, 5, 25, 19. It is the name of a breed of cows. My address is Coon Valley Alfalfa and Dairy Farm, Gentry, Ark. Linton Davis.

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman. Fort Atkinson, Wis. Do it now.

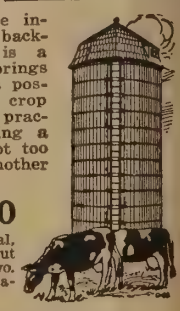
Condensed Milk Industry in Norway

The condensed milk industry celebrates its semi-centennial in Norway this summer, the first concern for manufacturing the product having been established in the city of Hamar in 1874. The Norwegians learned the method of canning milk products in the U. S. A. where the first efforts had been made in the middle of the last century. During the first years of the history of this industry sugared milk only was used for canning, but in the beginning of the eighties the Norwegian inventor, Dr. Sopp, succeeded in preserving unsugared milk in the same way through the canning method. The industry had a very rapid development and at present there are 6 large concerns that manufacture condensed milk in Norway.

The export of Norwegian condensed milk increased annually from 1876 on until the climax was reached in 1914 with an export of 20,000,000 kilogrammes. During the war the export decreased, chiefly because of the added domestic demand for the product and of the export prohibition that lasted for some length of time. For the last few years the export has been on the increase again, however, and in 1923 it reached a quantity of 8,400,000 kilogrammes. Trade journals of Norway express the belief that the export will continue to grow as the product seems to be entitled to extended markets all over the world.—ARNE KILDAL.

Minnesota Pure-bred Sire Campaign

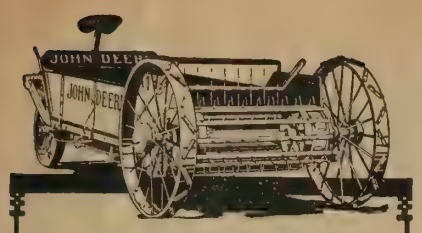


The Watonwan County, Minnesota, Pure-bred Sires Campaign recently completed, resulted in placing 84 pure-bred sires; this making Watonwan County the second highest—Blue Earth County still being in the lead with 106 sold. The total number of counties now covered in the state is 10, and the total number of bulls placed is 660; making an average in each county of 66. Of the total number placed up to the present time, 47 per cent are Holsteins, 26 per cent Shorthorns, 25 per cent Guernsey, and the balance distributed among the other dairy and beef breeds.—Minnesota Holstein Breeders' Association.

The entire Quechee Fells herd of registered Jerseys has been shipped from Vermont to Dade County, Florida, by the former owner, J. G. Howland.

One-half the herd of 80, which includes fine animals of the Oxford and Raleigh strains, has been taken by Marcus Milam, pioneer Jersey breeder of Dade County. The Bank of Bay Biscayne, oldest bank in Miami, controls the other half which has been put in charge of Frank Mitchell of Blue Ribbon Jersey dairy.—Miami Daily News.

Save Your Corn Crop



The most positive insurance against a backward corn crop is a **GOOD SILO**; it brings the greatest returns possible on a good crop and is the **ONLY** practical means of using a poor one. It is not too late to put up another silo this year.

The GEHL SILO

is simple, economical, efficient and easily put up in a day or two. Write for full information and prices.

12 Years' Service —Repairs $2.70

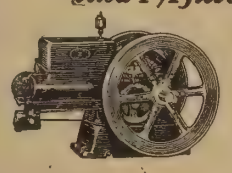
In 1912, J. P. Jacobson of Old Albuquerque, N. M., bought a John Deere Spreader. In April, this year, he had occasion to buy his first repairs, these consisting of springs and pawls for the drive wheels, at a cost of $2.70. And, mind you, Mr. Jacobson runs a dairy farm and spreads lots of heavy manure. When his John Deere Spreader finally does wear out, the cost per year will be mighty low.

And this case of many years of low-cost service is not unusual with John Deere users.

When you make strength comparisons—when you put the John Deere Spreader on the scales, you will appreciate why this spreader gives such low-cost service.

You may pay a few more dollars for a John Deere, but, in the long run, you will be many dollars ahead.

SEE THIS EASY-LOADING, LIGHT DRAFT SPREADER—THE SPREADER WITH THE BEATER ON THE AXLE—AT YOUR DEALER'S.



"Soil Fertilizers"—valuable book, also spreader literature free. Write John Deere, Moline, Illinois, and ask for booklet SE-614.

Friendly Talks for Farm Folks

The average child is usually all right in its weight if he or she is regularly fed the Milky Way.

⚜

It is a successful year on the average farm if there is enough left over after paying the multitudinous bills to buy a smart new suit for mother and an equally smart pure-bred calf for father. We hope with all our heart that every farm family in the land will have a little to the good this year after all their faithful labors.

⚜

One thing to be thankful for—folks still play croquet on the farm in preference to Mah Jongg.

⚜

It's been so out of the ordinary wet all over the country this spring that many a farmer has threatened to jump into the well and end it all. But why the well? That's just as wet as the river flats this minute!

⚜

Barry Newton says that his idea of being reasonably busy is to have the hired man take a vacation, and then have the cultivating, haying, lawn mowing, pea picking, spraying, setting in cabbage plants, berrying, and the breaking of vital machinery all crying to be tended to on the same day.

⚜

At a gas-filling station we know, they are giving ice cream cones with each purchase of ten gallons of gas. Well, one is as good for the human engine as the other for the car's.

⚜

We notice that the city ladies visiting the farm and who are on a diet for their excess weight always forget their calories at the country dinner table. How they do go in for Aunt Maria's raisin-rhubarb pie and creamy Dutch cheese and little new peas and potatoes swimming in butter and so on through the well known menu. We admit that it would take courage of a higher order than we ourselves possess to turn the other eye while such fillers are passing around.

⚜

Grandpa Eels hasn't any use for this so-called jazz music the young folks are forever playing on the phonograph, but he can sit for hours of evenings while grandma softly plays "When You and I Were Young, Maggie", on the old Melodeon.

⚜

Bert Bascon allows that until the auto gives birth to a little auto every year like old Brindle out in the barn, he calculates to put his ready money into the herd instead of into a slightly different styled engine annually.

⚜

If a man from Mars were to look downward upon our earth, if he had good eyes he would see long white strips crossing and crisscrossing which are constantly filled with white ants darting hither and yon. And mixed in with the ants would be larger insects of brighter hues and colors which would seem to be faster creatures and of more importance than the industrious ants. And if he were to ask somebody what the darting tiny black things were, he would be told that they were Fords, while the larger things were cars. And he would then probably think to himself, like Lincoln, "Surely the Fords must be the national car on earth, or ten million folks wouldn't be using them."

New York. HELEN S. K. WILLCOX.

Know Your Cow Contest

What county will win the "Know Your Cow Contest" when it closes August 31? This question is being asked by dairymen and farm bureaus in 22 counties of Kansas and Missouri. Sixteen Missouri and 11 Kansas counties entered this contest when it began January 1, 1923, and 22 of these counties are now nearing the close of the contest with a possibility of sharing in the one thousand dollars offered by the Kansas City Chamber of Commerce.

Four thousand seven hundred and thirteen cows are on test in 17 associations covering 22 counties. Other cows that were in the associations near the beginning of the contest, January, 1923, have completed a year's record and are not now on test. In contrast to this, there are some cows now in the associations which will not have time to complete records before the close of the contest. So there may be some surprises in store for those who have believed that the county with the largest association would win.

May reports show the average production of these 4,713 cows on test to be 647 lbs. of milk and 26.9 lbs. of butterfat. Four hundred and fifty-five cows produced over 40 lbs. of butterfat. The price of butterfat averaged 39.3 cents per pound.—G. W. CATTS.

Idaho will send a carload of cattle and a large delegation to the National Dairy Show. The Idaho Falls Chamber of Commerce is one of the most active agents in the state in boosting the exposition. Idaho claims a record of 400 pounds milk and 20 pounds fat in excess of the C. T. A. record of Wisconsin, queen of the dairy states.

Save Soft Corn in Hoosier Silos

Turn your late soft corn crop into a big money-maker by saving it in a HOOSIER SILO for winter feeding. Prompt shipments certain. Your order placed now insures delivery by the time corn is ready. HOOSIER SILOS in Oregon fir or glazed vitrified tile. Best materials and construction on the market.

Write Today for SPECIAL BULLETIN

We have prepared a special bulletin covering this year's corn situation, showing how you can turn late corn into big profit. Sent free on request. Write today.

POULTRY On The DAIRY FARM

J. B. HAYES

House Requirements

It takes a heap of folks to make a world and each one seems to have definite, settled ideas on poultry house construction. The one time when they all seem agreed to disagee is on this one subject. There are fundamental ideas that must be incorporated into every satisfactory house but the deviation that is possible and the combinations that can be tried are many and numerous. Every poultryman at some time or other has designed a special type of house to meet his own particular needs. In too many instances we see flocks that are giving excellent returns in poor houses but in such cases, it is the man behind the feed pail that is responsible, in spite of the poor equipment.

Some people believe in a change every time a new piece of literature on the subject is read. One flock owner that is well known is always just on the verge of obtaining perfection in ventilation and equipment. When one of his neighbors was asked what system was being used he said that he didn't know, for it had been impossible to get over for a visit in about a week.

That is rather the history of house construction for it has been a jump from nothing at all or makeshift sheds to expensive houses and from there back to the open type front. When this was found to be inadequate for all conditions, the next change was a closed building with no ventilation and finally a compromise.

As a resume one can state that the following points need to be considered: 1, location; 2, size; 3, width; 4, floor construction; 5, wall construction; 6, type of roof; 7, window space; 8, ventilation; 9, nesting space; 10, interior arrangement.

Even in these points there is abundant chance for one to show ingenuity and originality. Possibly it might be safer to say that economy of construction and flock comfort are the two ideals that one most desires. It is possible to construct a house that is too expensive and yet not achieve the desired goal. If the house does operate in a manner that will permit maximum production, the flock can in time pay out on the proposition. In too many cases, houses have been built and after they did not work, suggestions were wanted. These buildings are generally so improperly planned that improvements are out of the question and they stand as permanent monuments to a poultry failure.

A poultry house should be planned to fit the flock or the flock culled each year to properly fill the building. When one tries to put several times as many hens in the house as it should hold, poor results can be expected. Since most farm flocks are carried in 100 hen multiples, a 20 x 20 building should be the foundation unit. A 20-foot depth is about the maximum that one can use in a gable roof house without having a front elevation that is out of proportion. In the same way a minimum depth of 16 feet is as narrow as a house should be planned. Since a front ventilator is used, the birds must be roosted back far enough to avoid the influence of the intake.

A square building is the cheapest type to construct as it requires the smallest amount of total wall construction. While a 20 x 20 unit requires 80 feet of wall construction, a 10 x 40, which has the same floor space, requires 100 feet. The 400 square feet will accommodate about 100 of the heavier fowls permitting four square feet per bird, or 125 of the smaller breeds, such as Leghorns, that requires 3 x 3½ square feet. As the size of the flock decreases the space per individual must be increased.

If natural windbrakes are available it is well to take advantage of them in locating the poultry house. Of greater importance, however, is the relation of the poultry house to the home and the granary. A good flock in a good poultry house can be placed in sight as part of the farm buildings while a poor, mongrel flock in a makeshift building is generally stuck as far away as the other buildings will permit.

The house should face the south on a spot that has good natural drainage and is not overshadowed by other buildings. Abundant sunlight is required in the interior and it cannot be so arranged, during the winter, if some larger structure throws a shadow over it at all times except for an hour at noon. This point is becoming of greater importance each year. One house to my knowledge is a total loss because it was placed close to a large barn. That building is cold, damp, gloomy, and a mighty good flock under those conditions has never been able to do more than sustain life during the winter with every low production.

Although alternates are often suggested, such as an east or south-east exposure, they are never quite satisfactory. A little inconvenience in caring for the flock is preferable to poor location.

All parts of the floor must be elevated 8 to 12 inches above the ground level. This means that drainage must be considered. A well drained spot will permit the flock to range earlier in the spring than a bog that never dries out. When an east and west slope must be used, the floor at the lowest point must be placed a foot above the ground level and the other end brought up as high as necessary to have the floor level. Never defeat the entire purpose of building by running any part below ground level and do not build into a bank for warmth.

Digestive Troubles

My husband is a subscriber of Hoard's Dairyman and has advised me to ask you if you can suggest anything for hens dying in a way as described here. When I first notice they aren't well, they lag behind when others hurry out of coop to their feed and walk around in a dazed way; almost act like blind, don't seem to care for any grain. Their combs don't turn pale but rather darker and blueish, then they drop over dead. Seem to be heavy, too, because they aren't sick long enough as a rule to get poor before they die.

Neillsville, Wis. (Mrs.) E. B.

There is a possibility that there may be some disease present in the flock that is not indicated in the symptoms given. In all cases such as this, one should send a sick hen by express prepaid to the Veterinary Department of the College of Agriculture for examination. This work is done without charge and permits a definite examination and final diagnosis of the disease.

The fact that the hens are fat, sluggish, inactive, and with the combs turning purple indicates some form of digestive disturbance. This can be caused by material that the birds are eating, such as decomposed meat or refuse that has been found, polluted water, paint that has been thrown out or a number of other very similar materials.

In any case the use of Epsom salts is advised whenever the flock seems to be just a little bit out of condition. Keep them confined for a half day in the poultry house. The evening before, take away the drinking water and the next morning give the salts at the rate of one pound to the hundred birds. This can be mixed with the drinking water or may be combined as a part of a moist mash. Adding it to the water allows a more uniform mixture and assures all of the flock of getting a share.

If necessary, this treatment can be repeated in about a week. This is just a temporary measure and the real cause of the trouble should be found by a rigid post-mortem examination. The service is free and more people should avail themselves of the opportunity.

Hot Water and Steam Heat at Small Expense

(Continued from page 75)

steam pipe and valve A may be omitted and the heater connected up with a barrel or tank in the same manner that the water back in a range is connected with the hot water tank and water system in the city home.

In our tests and demonstrations we have used both the coil heater and the jacketed heater. The coil heater heats a given amount of water a little more quickly than the jacketed type, but where a considerable quantity is to be heated, the latter is somewhat more economical in the use of fuel, as there is far less loss of heat through the walls of the heater. Our tests and demonstrations show that either type of heater, when properly connected, furnishes plenty of steam for steaming the cans, pails, etc., in a small dairy, in addition to an abundance of hot water. However, if a large amount of steam is needed for sterilizing a large number of cans, bottles, etc., a steam feed cooker or a small upright boiler should be installed.

The Dairy House

A convenient dairy house helps to take the drudgery out of dairying. It need not be expensive or elaborate but should be conveniently arranged, well lighted, and sanitary. Ample provision should be made for plenty of pure water, both hot and cold. Two floor plans shown on this page fill these requirements and are adapted for use on farms where cream is sold. Note the arrangement for washing, rinsing, steaming, and sunning the utensils, and how they are worked around in the most convenient manner from the wash sink to the drain rack in the successive steps in their proper cleaning. The cooling tank and drain rack are near the outside door, making it convenient to load the cream into the wagon or truck and to remove the cans and pails at milking time. The drain rack should be on a level with the steaming shelf and should be located so as to receive as much direct sunlight as possible. The cooling tank should be on the north side of the house.

Are You Fair With Your Cows?

ARE you giving your cows a "square deal?" Is it fair to stable them on cold, hard, damp floors where they must stand and lie for many hours, and then expect them to give big yields of milk? Do you blame your cow or your floor when she slips and strains a tendon, or develops garget from the chill and dampness? Think it over.

Stall floors of Circle A Cork Brick are *safe* floors because they afford a firm, nonslippery foothold. They are *comfortable* floors because they are easy and resilient underfoot. They are *health-promoting* floors because they are warm and dry. They are "square deal" floors because they are the best floors you can provide for the cows you expect to do their best for you.

Maybe you never have thought about floors in just this way before. They are worth thinking about. Some interesting light on this subject will be found in the 32-page book, "Circle A Cork Brick", which will be sent you, free, on request. Address Armstrong Cork & Insulation Company, 112 Twenty-fourth Street, Pittsburgh, Pa.

Ⓐ Circle A Cork Brick Ⓐ
FOR DAIRY BARNS AND HOG HOUSES

REMEMBER, it's but a short distance from your cow's udder to the cream pitcher—the butter plate—the nursing bottle.

Keep her surroundings healthful, free from disease germs, and clean smelling, with Dr. Hess Dip and Disinfectant.

Provide a wallow for your hogs. To each 25 gallons of water, add about one quart of Dr. Hess Dip. Your hogs will do the rest. Good night lice and disease germs!

Use the sprinkling can—in the poultry-house for lice and mites, wherever there is filth or a foul odor.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Stifle Lameness in Cattle

The stifle joint in an animal is the one at the flank and corresponds to the human knee in that it is formed of the bones called femur or thigh bone above, tibia, or leg bone, below, and patella, or knee cap, in front. It is such a large and complicated joint that an injury or sprain of the part is a most serious matter, while disease of the joint usually proves incurable and opening of the synovial capsule of the joint often is followed by infection which proves fatal. In cattle there are also unusually large condyles or projections of the bones forming the joint and one of these may be broken off if the animal receives a kick from a horse or strikes the part hard against a door post or other obstacle. When that occurs it has been our experience that gangrene of the surrounding tissues and skin is liable to occur and the injury then proves fatal. There is no quite successful method of treatment. Sprains, or dislocation of the patella, more commonly occur, and may be more successfully treated.

When an adult shows a chronic and mysterious lameness of the stifle joint, with no known cause and only a slight amount of swelling or sensitiveness when handled, we always advise applying the tuberculin test at once as tuberculosis of the joint is a possibility and not infrequently met with. The disease is incurable and necessitates destruction of the affected animal, as prescribed by state law which the veterinarian who applies the test will explain.

When a wrench or sprain has affected the stifle, causing acute lameness and great swelling, heat, and soreness of the part, the best treatment is to wrap the joint with a blanket and keep that constantly wet with hot water for 24 hours. Following that treatment an anodyne lotion may be rubbed in now and then, as prescribed by the veterinarian. If chronic lameness persists after inflammation has subsided the hair should be clipped from the stifle and around it and a blister applied, if the cow can be so tied that she will be absolutely unable to lick the treated part. A suitable blistering salve is made by mixing together 1 dram of powdered cantharides (Spanish fly), 1 dram of bioiodide of mercury, and 1 ounce of unsalted lard. Rub it for 15 minutes. Wash it off in 48 hours; then apply a little lard daily. If licking is permitted the cow's rough tongue will make the part raw and may cause a permanent blemish.

When dislocation of the patella occurs, the hind leg is thrust stiffly backward and cannot be advanced. The hock joint may assume nearly a straight line. Examination discovers the patella on the outside of the leg, lower than its accustomed seat. Treatment consists in pulling the foot upward and forward by means of a rope and manipulating the patella with the fingers until it is forced into position with a snapping noise. Afterward the animal should be kept in a stall for a week and if the accident recurs a blister, such as we have already prescribed, should be applied to the part. In young animals the patella sometimes slips out and back as the animal walks, making a snapping sound. When that occurs the animal should be kept tied up and the blister applied to the joint.

Obstructed Teat

I have a 4-year-old Jersey cow with her third calf. Her left front teat has always been longer and larger than the others and has always given a little more milk out of that teat than the others. She gives a good flow of milk and is very easy to milk. She brought a calf about four weeks ago. The large teat is very tedious to milk this time. The milk tube or something that feels like gristle is a little larger than in the other teats. The teat is not sore and her udder is soft and good and milk is good. The milk seems to stop at top of teat. Could that teat be opened up without injuring the udder? If so, how?

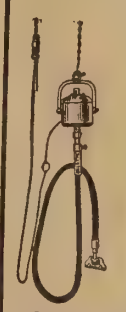
Ellington, Mo. T. L. W.

It is dangerous to operate when a growth or stricture obstructs the duct of the teat near the udder. A wound caused by a cutting instrument induces bleeding; then a clot may form and decompose or pus form. The result then may be a severe attack of ruinous garget. If a veterinarian, on examination, finds that an operation would not be advisable, it would be best to let a calf nurse or to dry off the secretion of milk in the affected quarter.

Ever Failing or Never Failing Pasture

(Continued from first page)

not be compared to bluegrass."—H. K. Williamson, Central Illinois.



"Sweet clover pasture is about three times as good as bluegrass."—E. L. Parker, Southern Illinois.

"Sweet clover pasture will carry three head to the acre for three months where with bluegrass it will require two acres for one head."—Andrew Johnson, Northern Illinois.

"One acre of sweet clover is equal to five acres of our slough and bluegrass pasture."—J. O. Tupper, Northern Illinois.

"One acre of sweet clover pasture is as good as five acres of bluegrass or common pasture in this vicinity, besides helping build up the soil."—Edwin Denman, Northern Illinois.

After reading the above statements made by men who have tried sweet clover as a pasture and know what it will do, one can but realize that sweet clover is a wonderful pasture crop. These statements which say that sweet clover is three or four times as productive as bluegrass are made after careful thought by these men who have had experience with both crops, and may be taken as reliable information. Their enthusiasm for sweet clover pasture is very evident, and what it has done for them it will do for others who will give it a chance. It certainly saves a big section of the farm.

Clipped Cows give more, richer and cleaner milk. Clipping improves the health of all kinds of your live stock.

Is Seeing Believing?

Mr. Fischler checked up on his eyes and was satisfied

Most Edgeworth is sold by word of mouth—one happy smoker will pass the good word along to some less fortunate brother, and a new Edgeworth "fan" is born.

Sometimes, however, the human voice plays no part in the spread of Edgeworth popularity.

Witness Mr. Fischler's letter:

Wellsboro, Pa.

Larus & Bro. Co.,
Richmond, Va.
Dear Sirs:
Last summer while on my vacation, which was spent on Pine Creek, one of the best fishing streams in Northern Pennsylvania, I noticed a lot of discarded Edgeworth tobacco cans. Especially were they noticeable near the good fishing holes.
When I returned home I bought Edgeworth and learned the reason for all those empty packages.
Yours,
Peter Fischler.

We're much too busy filling the blue tins here in Richmond to be able to follow them to the four corners of the earth.

It's a curious fact, by the way, that sportsmen everywhere show a marked preference for Edgeworth. There's something in the blend that strikes a responsive chord among fishermen and hunters, campers and hikers. We have had this quality of Edgeworth brought to our attention time and again, but have been unable to get at the reason for this partiality.

Perhaps some reader, himself a sportsman, can tell us why Mr. Fischler found so many Edgeworth tins "near the good fishing holes."

Be that as it may, "seeing is believing" with us just as it was with Mr. Fischler. Thousands of letters from pipe smokers are visual proof to us that in Edgeworth we are producing a tobacco that most men like.

You may not find Edgeworth to your taste at all, but we think it probable that you will. Let's try to find out!

Edgeworth is sold in various sizes to suit the needs and means of all purchasers. Both Edgeworth Plug Slice and Ready-Rubbed are packed in small, pocket-size packages, in handsome humidors holding a pound, and also in several handy in-between sizes.

If you'll write your name and address to Larus & Brother Company, 57 South 21st Street, Richmond, Va., we'll send you, postpaid, free samples of Edgeworth Plug Slice and Ready Rubbed.

What follows is a matter between you and your pipe!

If you care to write us the name and address of your regular tobacco dealer, we shall very much appreciate your courtesy.

To Retail Tobacco Merchants: If your jobber cannot supply you with Edgeworth, Larus & Brother Company will gladly send you prepaid by parcel post a one- or two-dozen carton of any size of Edgeworth Plug Slice or Ready-Rubbed for the same price you would pay the jobber.

Dozen Reasons Against T. B. Testing

(Continued from page 76)

is not another form of political graft.

12. If the milk from an animal affected with tuberculosis is a dangerous drink, who can explain why her steaks or rib meat are not equally as risky a food? This question was recently put to a man who is making large profits from the farmers' losses, but did not receive an intelligent reply.

We are told that it is possible to isolate the tuberculous germ and, if so, why not submit samples of each cow's milk to a careful analysis instead of cutting her throat in order to learn the quality of her product?

The writer does not contend that the tuberculin testing of registered herds is a mistake but the owner of grade cows, whose milk is pasteurized before marketing, should do a lot of careful thinking before risking the loss of perhaps his entire herd.

JOHN H. PULS - - - ALLENTON, WIS.

Important News about the Value of Fertility

1. Authorities have estimated that from ⅓ to ½ of all our barnyard manure is absolutely wasted, the annual loss totaling about $800,000,000. This loss is not alone on poorly managed farms but it includes many that in other respects are operated efficiently.

2. A Nebraska farmer reports this result of an experiment in manure spreading over a 3-year period—

Six acres, manure *spread by hand from a wagon box,* average number of bushels of corn raised per year: 336.

Six acres, manure *spread evenly by a manure spreader,* average number of bushels of corn raised per year: 420.

Three-year gain in bushels of corn, by the use of a good manure spreader, on the 6-acre area: 252.

3. McCormick-Deering manure spreaders put fertility into the soil as it should be done. They are light in draft, strong and simple, yet with the right adjustments so that you can spread all kinds of manure, as heavy or light as you need it.

Note these features:

1. Auto Steer. 2. Front Wheels Track with Rear. 3. Two All-Steel Beaters. 4. Wide-Spread Spiral. 5. Narrow Tread. 6. Self-Aligning Bearings. 7. Steel Main Frame. 8. Six Feed Speeds. 9. Positive Apron Drive.

Built in two sizes to fit small or large farms. See the spreader and its practical features at the store of your McCormick-Deering dealer.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Jersey Bull, You'll Do's Champion

Volume LXVIII, No. 5 Fort Atkinson, Wisconsin August 15, 1924

"I took your statement regarding the performance of a De Laval Milker with a grain of salt"---

said Lewis A. Toan, of Perry, N. Y., a breeder of purebred Guernseys, who goes on to say:

"We use the De Laval Milker and I am so well pleased with it and your De Laval Service that I want to express my appreciation. We were 'up against it' for help before we put in the De Laval Milker, with a stable of 24 cows and part of them on test milking three times a day. I must say frankly that I took your statement regarding the performance of the De Laval with a grain of salt.

"I am really surprised that the De Laval Milker can milk so fast and so clean. It is easy for me to handle the two single units, strip, carry and weigh the milk for our herd. Our bacteria count, by the way, is low — seldom over 10,000.

"We appreciate the Milker, and another thing—the De Laval Service, which you apparently forgot to emphasize when I purchased our machine. That in itself is worth a lot to a beginner. If anyone wants my opinion of the Milker, tell him to call me up."

There are thousands of other De Laval Users who feel just the same way. If you are milking 10 or more cows, a De Laval Milker will soon pay for itself in saving time and in extra milk of better quality produced through its use. Sold on easy terms.

EVER FAILING OR NEVER FAILING PASTURE

Part 7.

Sweet Clover the Greatest Labor Saver

WILBER J. FRASER, University of Illinois

THE addition of two acres of land per cow to the farm without cost is no mean gift, and in Part VI we saw how sweet clover pasture will do this for the dairyman if he but uses it. On the other hand, labor is equally as important as land, and is more often the limiting or determining factor, not only upon the possibilities and hazards of the dairy business, but also upon the health, development, and enjoyment of the dairyman himself and his family, for 40 or 50 years of life.

Most dairymen work hard early and late, year in and year out, tilling the soil, raising and harvesting the crops, and filling the silos, the mows, and the grain bins. In addition, there is the work of feeding these crops in the winter and, alas, much summer feeding besides, adding extra labor to the farmer's already busy day.

The Labor Problem

To make the most profit, we must have the labor of a dairy farm busy throughout the year at productive work which will add to the income. This means that there must be a regular program of work laid out which will make the amount of labor required at different seasons of the year as even as possible. To bring about a more economical use of labor in the corn belt, men often drive five and six horses on the plow and disc, and there is still much opportunity for development in the use of labor saving machinery in nearly all sections of the country.

SWEET CLOVER PASTURE, THE BEST HAND ON THE FARM

Summer feeding for Mr. H. Renschen of Southern Illinois means practically nothing but opening the gate and allowing his cows all they will eat of this fine sweet clover pasture. That this is an effective method of feeding is shown by the fact that three of these cows produced over 60 pounds of milk per day and one 75 pounds with no supplementary feed.

But the man with bluegrass pasture must, in addition to providing twice the area, furnish large amounts of supplementary feeds, the production of which involves a large number of laborious and time consuming operations, some of which are illustrated below. In addition, he must feed these crops each day in the barn or let his cows suffer from lack of feed.

We have all been using many old methods on the farm that are not economical in the matter of labor, for the simple reason that "father did" or the "other fellow does". The thing for us to do now is to systematize our work so as to do the most things with the least work, to accomplish the best results.

Much has been said and written about planning the crop rotation so that the various crops would give continuous employment to the same amount of labor throughout the crop season. Some of the greatest economy in operating farms in recent years has been brought about in this field. A notable example is the management of Mr. W. E. Reigel on the Meharry farm in Champaign County, Illinois. In the last 10 years in which he has been manager, he has reduced the actual money cost of man labor on this farm 40 per cent, and this in spite of the fact that at present the wages are practically double what they were 10 years ago, and all the labor is hired on this 800-acre farm. He did this largely by planning a rotation of crops in which one crop follows the other with as little work in preparation of the land as possible, and by allowing the stock to harvest 160 acres of sweet clover pasture and a good amount of corn themselves.

There is a great opportunity for labor saving on dairy farms simply by cutting out bluegrass pasture and the necessary feeding of silage, hay, and grain that goes with it. When sweet clover pasture is substituted for it, the cows can harvest their feed themselves for the entire six months.

Every dairyman knows what a relief from hard, back-breaking labor it is when the day arrives in the spring that the cows can be turned onto pasture. The year's round of work is the *dairyman's burden.* Much of it is inevitable, but if any large part of this toil with crops and toil in feeding can be removed without lowering the year's income, the dairyman will have a distinct relief and a large saving of expense.

Saving Four Months' Labor

If sweet clover pasture were substituted for bluegrass, practically all

MAKING HAY, RAISING CORN, AND FILLING THE SILO FOR SUMMER FEEDING TO SUPPLEMENT BLUEGRASS PASTURE

Eighty-two Years of Agricultural Observation

E. A. POWELL, NEW YORK

Those who have never seen grain harvested except by a self-binder; can little appreciate that there are men still living who saw grain cut with the sickle. Mr. E. A. Powell, a banker and a prominent breeder of Holstein cattle at Syracuse, New York, when a boy, saw grain cut with a sickle and he himself used the cradle for harvesting grain and the scythe for cutting hay. Recently he related to us some of his early experiences on the farm and took occasion to epitomize the development of agriculture as well as transportation and other industries. His life has been so full of experiences and he has covered so long a period of both close application to his work and close observation that this interview was to us most interesting and we take pleasure in passing it on to our readers.—Editors.

EIGHTY-TWO years ago, on the Fourth of July, I got my first observations in agriculture at the old homestead of the Powell family in Crawford County, Pennsylvania. On that beautiful Fourth of July, I escaped from the watchful care of my mother to view at a closer range a scene in an adjoining wheat field where my father, according to the custom and times of the community, had invited neighbors and friends to join in a Bee to cut his crop of wheat of about three or four acres, which was the largest crop in that vicinity at that time.

I made my way to the gate where I could look through—but could not unfasten. A curious scene presented itself. Probably a dozen men were on their knees, moving first this way and then that, in order to cut the wheat which was then ripe. This was being done with a sickle in the hands of each operator. Handful after handful was cut and placed in bunches ready to bind. At that time no other mode of cutting wheat was

E. A. POWELL

known in that section. The hand-cradle was just coming into general use. Such was my first observation in agriculture, and I have watched the growth of this great industry from that small beginning up to the present time in nearly all parts of the United States.

The hand-cradle soon became common and in twelve to fifteen years it became my favorite occupation in cutting wheat by hand. Machines for that purpose came much later. At about this period the mowing of grass for hay was all done by hand. It was an attractive sight to see a dozen mowers in line, one just behind the other, all keeping perfect stroke, as regular as keeping time to music.

The old Allen mower, which was the first introduced in that section, was bought by my father and I soon became quite expert in using it. With the improvements that have been made since that early date, your readers are quite familiar.

I have watched with interest every progressive step up to the present time when we see in the West, and especially in California, great machines which will cut, thresh, and bag a swath of many feet every time it goes around the field.

Great tractors, turning eight to ten furrows at a time, followed by harrows, grain drills, and finally by rollers, are all drawn by the same tractor so that by going over the field once the whole process is completed.

In the winter of 1855 and 1856, when I was 17 years old, I was left in entire charge of the farm with a large herd of cattle, over twenty horses, twenty-four, if I remember rightly, and a large flock of sheep. The preceding season was the driest I have ever known and during the winter hay was so scarce that it was almost entirely out of the question to secure it at any cost. I soon discovered that it was impossible to winter our stock under the usual methods of feeding, for our crop of hay was very light and it was useless to attempt to buy. We had on hand a very good crop of corn.

I had heard my grandfather, who moved into the section in 1812 when it was all wilderness, recall that he had to keep his two cows on browse until he could clear land enough to grow other fodder. In thinking the matter over very seriously, I concluded that I could winter the cattle and horses on browse which the people at the later date, that of my boyhood, knew nothing of. We had an excellent man on the place, living at the extreme end of the farm. I arranged for him to meet me in the morning in the wood lot. After doing the chores about the barn, I would start for the woods at daylight, followed by the herd of cattle, and carrying an axe and a bag of corn on my shoulder. I would give one or two ears of corn to each steer on the way and they were glad to follow on this account. We chopped for the entire day for one hundred days except Sundays, eating cold, frozen dinners which we had with us in the woods. The cattle soon learned to eat the browse as fast as we would fell the trees. So eager did they become to get at the fresh limbs that as soon as a tree would be ready to fall, they would rush for it and had to be kept at a distance by a dog, which was well trained, until the tree had fallen. Fortunately the winter was extremely cold, so much so that there was good sleighing for 100 days, the whole country being continually under a heavy blanket of snow. On this account the cattle were ready to eat browse every day until the last of April.

After bringing the cattle to the barn each night they were given another ear or two of corn with a mere handful of hay or straw which seemed very necessary in order to keep them in condition. The result of this forced experiment proved very satisfactory for the cattle were wintered in fine condition so that for the splendid bunch of steers, for which I was only able to get an offer in the fall of $12 per head, I sold on the first of June following for $62 per head. This was my first and only recourse to such extreme measures in wintering cattle, and fortunately it proved very satisfactory. Of course, it was hard work, especially for a 17-year-old boy, but I never enjoyed better health than during that winter and a few years following, so that I concluded that very few people are injured by hard and continuous work.

Boys were developed at that period by hard work on the farms during the summer—attending common school in the winter and three months' "Select School" during the autumn, doing chores night and morning. Our community had a literary or debating society one or two evenings each week. We were fortunate in being blessed with parents who encouraged us in this work. In fact the whole community and entire section was composed of New England people who thoroughly believed in hard work and earnest study.

From our debating society were developed two members of Congress, a judge, two brilliant attorneys, a lecturer who was frequently called on to speak at agricultural meetings in all sections of the country, a successful banker, and several very successful teachers.

I thus diverge from the subject which was the one given me, to express my opinion based on observation that a college course, while very desirable, is not absolutely essential to success even in the practical or literary walks of life, although I highly approve of it where possible.

My work on the farm, attending school as mentioned above, soon gave me an understanding of all farm work and at the age of ten years I assisted in the plowing, seeding, and harvesting. I frequently milked 10 cows night and morning.

My love for live stock, both horses and cattle, seemed to be inherited. My father, Hon. Howell Powell, was a practical breeder and from my earliest recollection had upon the farm the first herd of pure-bred Devons in Western Pennsylvania, which has been continued in its purity by selecting sires from the best herds in the East for at least seventy years.

Other breeds were also introduced, consisting of Shorthorns, Herefords, and finally Holstein-Friesians—the latter being introduced quite extensively after I had disposed of my interest in what had already gained quite a reputation at our old homestead, "Shadeland". Each breed was kept pure.

In 1868 I adopted Syracuse as my home and the nursery business as my occupation. "Shadeland" became greatly extended and improved under the management of Powell Bros. until it was recognized as one of the leading live stock establishments in the country.

My partner in Syracuse was W. Brown Smith, my father-in-law, an eminent nursery man, and J. H. Clark, whose health failed and he soon retired. In looking over the situation, we observed that the business required a large amount of land in course of preparation and fertilization before it could be prepared for nursery purposes.

The hay and grain grown on the farm was sold and fertilizer bought to put the land in proper condition. It soon became evident that for economy it was better to feed out the produce and produce our own fertilizer. To bring this about, we first secured a herd of Ayrshires which we bred a short time, when the whole herd was disposed of. We next bred Shorthorns with a few Jerseys and Guernseys. We then secured the herd of General Patrick—Milking Shorthorns—which had already made quite a reputation, some being excellent and some poor, but on the whole not entirely satisfactory. Honorable Chas. Sedgwick, a friend of the family visited Holland and made a small importation. He made us a present of a beautiful bull calf which was a cross between a famous Shorthorn cow and his imported Holstein bull. Both these ancestors were pure blood. We crossed this bull with pure blood Shorthorn cows, selecting the poorest milkers in order to see the result. This cross gave us the first heifers we had ever seen which gave over 40 lbs milk a day at two milkings before they were two years of age.

These results called for further investigation. We visited all the Holstein herds we could hear of in the East. The result was that we bought the bull, Uncle Tom, and nine females of Hon. Gerritt S. Miller. We then commenced to import after buying these animals in 1875, making frequently several importations in a year. Since that time the Lakeside herd I think has been well known to our fellow breeders.

In reading an account of the flight of Lieut. Russel L. Maughan, flying from New York to San Francisco between daylight and darkness, I was forcibly reminded of the wonderful development in transportation in the United States. I well remember in 1849 during the gold fever of California, two uncles decided to seek their fortune in the land of gold and like a multitude of ambitious Americans, they decided to visit California. They sailed from New York around Cape Horn, landing at the Golden Gate. The trip required six months time.

Imagine the contrast between such a trip in 1849 and one day for the journey in 1924.

At that time railroads in the East were just beginning to be developed. A line over the Rockies was supposed to be impossible, but now passenger trains carry their passengers by several routes, each with all the luxuries which ingenuity has invented, across the continent in five days.

What the future has in store for our country and for mankind in general baffles our imagination.

After 80 years' experience and observation in both country and city life, I do not hesitate to say that the country is by far the better in which to rear a family of useful citizens where every child should have regular duties to perform, commencing at a very young age. Every child should have a regular period for play and recreation as well as work and study. He shall have no time for absolute *idleness*, for *idleness* is the curse of America today—the forerunner to *crime*.

I have led a very busy life—never shirked hard work, and now in my 87th year am at my desk attending regularly to business. The teaching of this experience is that hard work injures very few, while idleness is the arch-enemy of young and the blight of age.

Making Soy Bean Hay

GEORGE M. BRIGGS, WISCONSIN

In curing soy bean hay in stacks D. K. Barrett of Burnett County was one of the first users of wild hay as a top covering. This is the best use of wild hay we know of—protecting other good hays.

AT 6 a. m. the Shawano county agent's telephone rang violently. The voice at the far end said, "Mr. County Agent, the steam is coming out of every door, window, crack, and flue of our barn. What are we to do? The soy bean hay is going to ruin us and destroy everything." In his masterful voice the county agent said, "Don't worry. It will come out O. K. Your barn won't burn up. Don't move any hay, just leave it alone." In another three months, Mr. J. McMillan, from an adjoining town, came into the county agent's office. Without any introduction he started in about as follows:

"Say, Murphy, I can live on that old farm now. You remember that woman that called you up at 6 a. m. one morning last fall? Well, that was my wife and for sure we thought our whole place was going to be destroyed —but do you know, that hay cured out the finest and sweetest of any I have ever had." You know we put that hay up rather green but had no idea of it heating but after this result I'm not afraid of curing soy bean hay. You know that hay is compact and smells and appears just like so much chewing tobacco. Its too bad to get cows in the tobacco chewing habit. But the fine results from that hay I'm getting assures me that I needn't starve to death on that sand farm and that I can really live there."

With the thousands of acres of this legume planted for hay, there are perhaps many farmers wondering just when is the best stage of the plant's development for hay, and how is the best way to handle the crop after it is cut so as to make the most palatable hay.

Experienced soy bean hay makers say that soy bean hay making is comparable to curing second crop clover —but even at that, any crop cut for hay in late summer time is subject to slower drying weather, muggy, foggy mornings, and at the best needs a few clear days to make the best hay.

Despite the method used in curing, the stage the hay is cut, or the quality of the hay that is finally mowed away, some almost unbelievable tales are told of the wonderful palatability of this legume. It should be encouraging to the man expecting to put up soy bean hay this fall to know that regardless of how the hay is cared for, no matter how much rain or fog, no matter if shocks float about in the field, no worry if mow or stacks heat, that old bossy will consume the apparently non-palatable hay as soon as any other hay and produce milk on all four cylinders right through the season.

At the Wisconsin Experiment Station in two trials comparing alfalfa and soy bean hay for milk production, very little difference was noted in these two legumes. In the first trial the soy bean hay was cured excellent, never having a rain on it, being bright and green when put into the mow, but in the last trial the soy bean hay would grade about a No. 3, being bleached, and having been handled so much that many of the leaves had broken off and the hay appeared woody, stemmy, and unpalatable. In both tests there was some of the coarser stalks refused by the animals. This amount varied with the animal, yet these cows held their own with the alfalfa fed cows where less stems were refused.

The side delivery rake is very satisfactory for handling soy bean hay.

Summary

1. One's available machinery and labor will decide how to cut and handle the soy bean crop.

2. While the greatest amount of nutrients will be obtained from cutting soy beans when pods are partially mature and leaves yet adhering, yet the weather is a big factor in curing soy bean hay, so every farmer that has power to prophecy good weather wants to jump at the right time.

3. In curing soy bean hay, after having it in medium sized cocks, rather than spreading it out, it is often best to let it cure, even though it takes ten days or more.

4. In stacking or mowing away, if hay is slightly damp, alternate layers of other hay or straw can be used to good advantage.

5. In large acreages, side delivery rake and hay loader can be used as with any other hay, but use all tedding machinery in morning when leaves are tough.

6. Don't worry, the hay will be usable even though it does not appear all green. Just try some for bedding and see how your stock produces on it.

The mower is possibly used more for cutting soy beans for hay than any other implement. Despite the coarse stems few mowers are hurt in using them for cutting soy beans for hay. It is true where soy beans are planted in rows that the bar has to be tilted in order to avoid running into the soil.

Proper Cutting Time

The best stage of the plant to get the most protein would be when the plant is just blossoming. At this stage the plant would be leafier and probably every stalk would be consumed as they would be less woody than at a later stage. Curing at this early stage, however, requires excellent weather because of so much sap in the plant, and a much lessened yield would be derived as there is a great increase in total weight from blossoming stage to a stage where pods are partially filled. In one field in 1923, where part was cut on August 20, with a yield of 1¼ tons, on September 10 on the other part of the same field a yield of 2½ tons was harvested. This field was planted late—just before the Fourth, so at first cutting was only nicely blossomed, while at later cutting was well podded.

Recommendations for cutting soy bean hay often consist in advising to cut "In good hay curing weather". Some farmers say that if they want it to rain, it is only necessary to get the mower out and the chatter of the sickle seems to aggravate the weather man just like so many fire crackers and about the next day, along comes a downpour. In 1922, August 25 to September 5, was an excellent time to cut and cure soy beans, but in 1923 it was better frog weather than hay weather, so I presume that time of cutting soy beans for hay will be an individual matter; cutting plants at time when most leaves are adhering, and when lower pods are about full size and partially mature, and what promises to be fair hay weather. It is well worth remembering, however, that late fall weather is not conducive to best hay curing, in that fog is often heavy and along equinox time it occasionally rains.

The ideal method of curing soy bean hay. On the farm of Mr. Kanne, Wisconsin.

Double Crop

We can seldom expect to get both hay and seed from the same crop but the experience of Less Walker, Wisconsin, is worth giving. In fall of 1923 he cut 11 acres Early Black soy beans for hay. In leaving them until good hay curing weather they probably got a little mature, but those farmers knowing the Wisconsin Early Black know that the leaves will adhere until after the pods are fully mature. After having the hay in the mow, he discovered so many ripe beans he thought he would thresh them. From this 11 acres, he threshed 9 bushels to the acre, besides having his two loads of feed which made his Jersey cows give him a handsome profit during the winter of 1923 and '24.

Best Way of Cutting

There is no best way I know of to cut soy beans for hay. The growth of the plants will determine what machine can be used and often a farmer is limited in his choice to what he has—it not being necessary to have any special machinery. The mower is probably used the most and with the pea roller attachment makes a most satisfactory method—however, cutting with a mower, then using side delivery rake or hay rake after leaving in swath for one day makes a very desirable method and with corn many farmers who have an old fashioned reaper available, have the ideal machine for cutting and curing soy bean hay. In cutting with this reaper no other handling of the hay is necessary until it is loaded on the wagon. Mr. Lee of Green Lake County says there is nothing to curing soy bean hay when a reaper is available. All you have to do is to cut it and just wait until it is dry enough to put it into the mow. Michael O'Keefe of Portage County, Wisconsin, has used the common binder to advantage for past two seasons. He cuts and shocks his soys for hay as one would for grain with best of

(Continued on page 118)

V. P. Atwell, one of the largest growers of soy beans in Wisconsin, says that the reaper is indispensable in cutting soy beans for hay or for seed. Mr. Atwell has raised hundreds of acres yearly for several past seasons.

GROWING ALFALFA SEED IN WISCONSIN

R. A. MOORE, Wisconsin College of Agriculture

FOR the past quarter of a century, Wisconsin has made wonderful strides in the growing of alfalfa as a hay crop and to some extent in using the crop for silage. However, it was not until three or four years ago that much of any attempt was made to grow alfalfa seed. The same feeling existed among our farmers in regard to growing seed as existed 25 years ago in regard to the growing of alfalfa as a hay crop. Very few then thought it could be done. Now nearly every farmer is convinced that under proper care and management he can grow alfalfa as a hay crop luxuriantly and find it to be one of the very best crops that he grows upon his farm.

The interest is so great that the acreage increased from practically 150,000 acres of alfalfa this year to 800,000 and we will not be surprised if the acreage really doubles again next year. However, the growing of alfalfa seed has only been attempted by a comparatively few of our alfalfa growers when we consider the large number who are now growing this great forage plant. Three years ago a campaign was put on through the Wisconsin Experiment Association to grow alfalfa seed. Our Association which is the leading seed growing association in America, saw no reason why a systematic study should not be made of the various conditions that would enable the average alfalfa grower to grow seed to be placed on the market. Through this campaign the second cutting of many of the older fields was left for seed and the sum total of 2,500 bushels was grown in 1921. Again in 1922 an increase of 500 bushels was obtained with a total of 3,000 bushels and in 1923 another increase was obtained and the sum total of 4,000 bushels of alfalfa seed was grown. Nearly one-half of all the seed grown was Grimm seed and its origin could be traced back to the genuine Grimm stock. Much of the other seed grown in Wisconsin came from older fields in which there was some doubt as to its true identity. Some of this undoubtedly came from the Grimm stock, but was not purchased under that name. Others came from hardy northern grown stock and consequently was hardy seed.

Yields of Seed Per Acre

From the tests run in the state of Wisconsin, it was found that the largest yields recorded were from the true Grimm stock and fields that were at least two years old or over. The writer had the pleasure of visiting a field of 15 acres of alfalfa on Mr. Neil Quotsoe's farm at DePere. This 15 acres grew $1,440 worth of seed last year. Mr. Quotsoe was very enthusiastic over the seed proposition and claimed that he expected to leave at least 25 acres go to seed this year.

Effect of Cutting Alfalfa for Seed Upon the Subsequent Crop

This field of Mr. Quotsoe's was visited quite largely to note what effect the harvesting of alfalfa seed had upon the crop the coming year. These fields had already been cut once and an exceedingly fine stand of second growth was coming on rapidly. It was estimated that it would reach the cutting stage for hay in about two weeks. This field, with other fields that were cut for seed last year visited, showed beyond the least shade of doubt that no harmful effect would come to the alfalfa from using the crop for seed instead of using it for hay.

Crop to Be Taken for Seed

Nearly all of the alfalfa fields that were saved for seed last year came from the second cutting, although in a few cases the third cutting was used. However, the facts gathered from those experienced in growing alfalfa seed seemed to favor the second cutting. This order of taking the second cutting for seed will be carried out again this year.

Suggestions Relative to Determining Whether or Not a Seed Crop Will Develop

Alfalfa seed develops most largely during a dry period of time. The alfalfa blossoms are very delicate and when in full bloom a short, sudden shower can destroy nearly all the fertilization, so consequently a crop that passed through this ordeal would not be worth while saving for seed. However, during the latter part of July and the month of August, we usually have dry weather. If we have showers that are merely local and while many fields would be damaged from the point of yielding seed, yet many other fields in the same township might not be touched by a sudden shower and consequently would be in prime condition to produce seed. There is at least a week that the flower should open and not be subject to a sudden downpour of rain in order to fertilize to best advantage. Honey bees and other insects help materially in tripping the flowers to aid fertilization, so consequently in a region where honey bees are quite numerous, we can expect a larger yield of seed per acre than places that are several miles remote from honey bees.

Whether or Not the Crop Should Be Saved for Seed

Through careful work on the cutting stage of alfalfa we have states now that advocate much later cutting than heretofore. Where careful experiments have been carried on, it has been found that the full bloom stage, like the red clover stage, is practically the proper stage to cut for the best protection of the plants and for the greatest amount of hay. If a farmer wishes to determine whether or not his fields should be left for hay he can let the second cutting come into full bloom and then wait a few days for the advanced flowers to show some signs of whether or not they will produce seed. There are always some plants that blossom a few days in advance of others and these particular plants would show the little green spiral pods on the various branches of the plant. This is a sure indication that seed is developing and consequently a farmer can rest assured that he is going to have a supply of seed. However, on the other hand, if the examination showed that there were very few if any of these spiral pods developing there would yet be ample time for him to take this cutting for hay as he did the first cutting, so consequently the saving of this crop to determine whether or not it would develop seed would not in any great degree injure the hay crop from the second cutting.

Alfalfa, when cut for seed, is handled practically the same way that red or alsike clover is handled. Often with merely a buncher attachment or a side delivery which enables the alfalfa to be carried to the side and deposited as a windrow where it can go through the drying process and be easily taken up into box racks and stored away in barns or drawn directly to the huller after drying. The regular clover huller is altogether the best machine for taking out the seed, although some separators with clover seed attachment do the work fairly well. However, the regular huller does considerable in the way of scarifying the seed while hulling and consequently leaves the seed in much better form than other devices.

Yield of Seed Per Acre

The yield of seed varies quite as much as red and alsike clover. However, the data at the present time would show a much larger average yield than received from clover. We have records showing a yield as high as eight bushels of Grimm seed per acre. We have other records of six bushels and better and often we find as high as four bushels per acre threshed from various fields. Where farmers are growing the regular Grimm seed, they usually find a ready market from 35 to 40 cents per pound. This makes it an extremely profitable crop to grow, besides the straw or hulm is of considerable value as a feed after the alfalfa seed is hulled. Sheep and other classes of live stock will eat the ground stems of alfalfa very readily, so consequently a farmer gets some return from this as well as having his seed crop.

Wisconsin Seed in Comparison with Seeds Grown in Other States

Several pieces of new seeding were inspected this year to determine whether or not Wisconsin seed would compare favorably with the seed coming from western and northwestern states. In every instance the Wisconsin seed seemed to give a good account of itself. There were also fields that had been put in two years ago from Wisconsin seed and even the common seed grown in the state seemed to give most excellent returns. This seemed quite natural from the fact that nearly all of the common seed which was grown in Wisconsin came from fields that were from three to six and even eight years old, so consequently if the alfalfa had not been of a hardy strain it would have died out before reaching that stage in the years of its growth. Not a single failure, so far as could be determined this year, was determined from fields that were seeded with Wisconsin grown seed. We are looking forward with a great deal of interest to this great industry which we feel is sure to come and be of immense benefit to the farmer. We hope every farmer will think over this matter before harvesting all of his second cutting of alfalfa for hay. Many who have an ample supply of hay for this year can well afford to wait to determine whether or not their second cutting may produce a bountiful crop of seed in which case he will be amply remunerated in saving his second cutting for seed.

THE DAIRY COW BREAKS INTO SOCIETY

Left to right: W. Palmer Clarkson, president of St. Louis Chamber of Commerce, about to be decorated with second prize by Acting Mayor Neun of St. Louis. "Close-up" of Mr. Clarkson in action. The eight dairy maids who served in the cow milking contest.

On July 17th the dairy cow officially broke into St. Louis society. The occasion was the 10th Annual Benefit Baseball Game of the St. Louis Tuberculosis Society between the National League teams of St. Louis and Boston. The event was a cow milking contest between three prominent citizens of St. Louis who felt their hands had not lost the old time cunning at milking.

Fifteen thousand people were at the ball park when three pure-bred Holsteins from the herd of F. W. A. Vesper, proprietor of Fredmar Farms, were escorted to their places by eight dairymaids and several leading citizens. The three contestants were W. Palmer Clarkson, president of the St. Louis Chamber of Commerce; William H. Tiffin, mayor of Ferguson, a suburb of St. Louis; and Flint E. Garrison, chairman of the St. Louis Style Show Committee. The milking contest lasted four minutes. Mayor Tiffin won first place by drawing 12¼ pounds in the four minutes.—W. A. FOSTER.

Uncle Ab says country life is the best only when those who live it think so.

Cow Testing Associations

Following is a summary of reports received during the week and up to the time of going to press of this issue:

Association Notes by Testers

Northern and Central Berkshire, Mass.: Many farmers have had their soil tested and are busy preparing for alfalfa. Several have been successful this year with small patches they put in to experiment with. One new member joined the association. Pittsfield Milk Exchange paid $2.90 per cwt. for 3.5 per cent milk; Sheffield Farms, $1.73 for 3 per cent milk; Dairymen's League, $1.94 for 4 per cent milk. Milk retailed for 13—14 cents per quart.—T. H. Weed.

North Kent, Mich.: Fourteen members feed grain. One member feeds in the barn and does not pasture his cows. One new separator was installed and another repaired. Market milk sold for $2.30 per cwt. The condensery paid $1.75 or 4 per cent milk.—H. Hansen.

South Van Buren, Mich.: The high cow for the year, owned by B. M. Poorman, made 9,627 lbs. milk, 528.2 lbs. fat. The average production per cow in the association was 6,923 lbs. milk, 348.5 lbs. fat. All members use pure-bred sires. One hundred and eighty cows were tested for tuberculosis and only 4 reactors found. Nine separators were tested monthly during the year and only one had to be repaired. Market milk sold for $3.20 per cwt. The creamery paid $2.50 for 3.5 per cent milk.—L. S. Ashley.

St. Joseph, Mich.: During June 278 cows were tested, with an average production of 624 lbs. milk, 21.9 lbs. fat. The average value of product above cost of feed was $8.88 per cow. Market milk sold for $2.82 per cwt.—R. S. Tompkins.

Traverse—Antrim, Mich.: An interesting dairymen's meeting was held July 3 at the Elk Lake Inn. After a chicken dinner was served, interesting talks were given by Professor Humphrey of the University of Wisconsin, and County Agent L. L. Drake of Antrim County. Market milk sold for $1.75 per cwt. and retailed for 10 cents per quart.—R. J. Kaiser.

Columbia Co., Wis.: One silo was erected. One new member joined the association. T. B. testing is in full swing and few reactors are being found. In July the condensery paid 39 cents per lb. for fat, the cheese factory, 38 cents; the creamery, 42 cents. Milk retailed for 8 cents per quart.—A. H. Weber.

Eau Claire No. 3, Wis.: Three cows tested in July made over 100 lbs. fat, 2 over 90 lbs., and 44 over 40 lbs. This month closes the testing year, with the high cow having a record of 750.4 lbs. fat, owned by Robert Ray. High herd average is held by Theodore Mathiews, with an average production of 476.66 lbs. fat.—S. Lowe.

Alma—Cochrane, Wis.: The average production per cow increased from 6,857 lbs. milk to 7,723 lbs. and from 243.5 lbs. fat to 268.52 lbs. in one year. One milk house was painted inside and 2 barns painted. Two more retests were made. The creamery paid 43 cents per lb. for fat in July.—E. R. Bailey.

Cows for the National

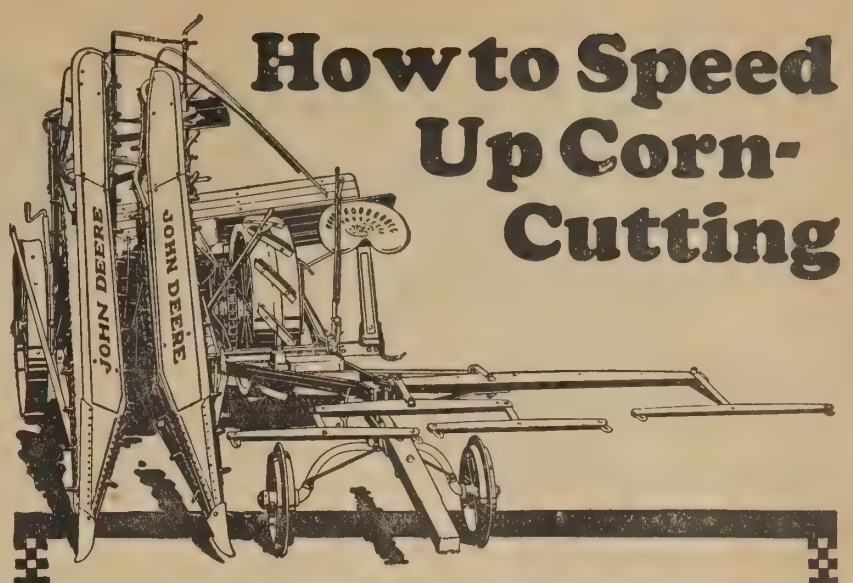
In a letter to one of the supervisors of cow testing associations in Wisconsin, D. P. Hughes of the Dunn County School of Agriculture, says:

"You will be interested to know that we held a meeting of the committee for boosting the National Dairy Show a few evenings ago. At that meeting it was decided to send a carload of ten or twelve cow testing association record cows to the Dairy Exposition. It was also decided to send a carload of calves from the boys' and girls' clubs.

"Best wishes for your success in putting on the greatest Cow Testing Association Exhibit ever held in Wisconsin. Cow testing is doing more for the dairy industry than any other single line of work."

Yearly Report Dubuque No. 3 Association

The first year of work in the Dubuque No. 3, Iowa, Association was complete in May. The average production of 192 cows on test was 5,212 lbs. milk, 229.1 lbs. fat. The high cow, a grade Jersey by the name of Goldie, owned by Chas. A. Hamil, produced 9,660 lbs. milk and 527.6 lbs. fat at a feed cost of $87.36 and a profit above feed cost of $184.08. The high herd of twelve grade Jerseys owned by Chas. A. Hamil produced an average of 7,051 lbs. milk and 364 lbs. fat at a feed cost of $84.76 and $98.20 profit.



Three silos were built and five new separators were bought. There were several scrub bulls in the association at the beginning of last year which were all replaced by pure-breds.—ALFRED B. BREITBACH, Tester.

When men are friendly even water is sweet.—Proverbs of China.

SOUTH DAKOTA TESTERS

These testers met at Brookings last June and formed a testers' association with F. A. Revell as president, F. E. Hanson as vice-president, and C. E. Heeren as secretary.

How to Speed Up Corn-Cutting

That job of cutting corn for either fodder or silage is shortened by days when a John Deere Corn Binder goes into your fields. Seven acres of corn cut and bound ready for the shock or silo is an average day's work with this time- and labor-saving equipment.

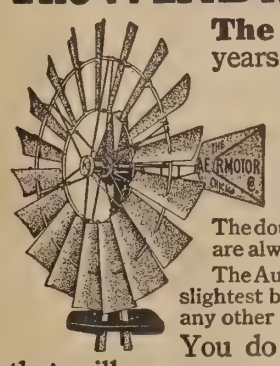
When you get through in your own fields, there's always work for you in the neighborhood, at a profit.

John Deere Corn Binder

The Binder with Power Carrier and Quick-Turn Truck

Operating a John Deere is mostly a horse-driving job—there's no real work about it. There's no work of dumping the bundle carrier and returning it to position hundreds of times a day. The power carrier does all this work for you—merely press a foot lever and the power carrier dumps the bundles free from the horses' path, and practically parallel to the standing corn.

The Quick-Turn Tongue Truck is another feature you will appreciate because it takes neck weight from the horses—makes it easy for the horses to turn at the ends and keeps the binder running straight—sluing on side hills is largely done away with.



There's a world of real points on the John Deere that are important to you. Be sure to see it at your John Deere dealer's.

Free booklet tells all about it. Write John Deere, Moline, Ill., and ask for Booklet EC-414.

JOHN DEERE — MOLINE ILL

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

The WINDMILL with a RECORD

The Auto-oiled Aermotor has behind it 9 years of wonderful success. It is not an experiment.

The Auto-oiled Aermotor is the Genuine Self-Oiling Windmill, with every moving part fully and constantly oiled.

Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet.

The Auto-oiled Aermotor is so thoroughly oiled that it runs in the slightest breeze. It gives more service for the money invested than any other piece of machinery on the farm.

You do not have to experiment to get a windmill that will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine.

Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production. The Aermotor is made by a responsible company which has specialized in steel windmills for 36 years.

FLEMING BROS. 194 UNION STOCK YARDS CHICAGO

"27 Years at the Stock Yards"

EDITORIAL COMMENT

THE dairy industry is already a tremendously big business. In 1923 the total income for dairy products and dairy animals slaughtered for beef and the increase in the number of dairy cows amounted close to $3,000,000,000, or very nearly 25 per cent of the total value of all farm products in 1923.

COW TESTING DEVELOPS MEN

One of our subscribers in Michigan, Mr. E. P. Reynolds, sends us the record of a herd in his community, owned by Mr. C. E. Burke, that averaged 513.6 lbs. fat last year and the previous year 425.5 lbs. fat. Mr. Burke owns 7 registered Holstein cows and they are producing for him more fat than 24 average cows and making him ten or more times the profit.

We can't expect the average good dairyman to have his herd average to produce 500 lbs. fat a year. We have often stated that a herd that averages 300 lbs. is doing exceptionally well.

It requires men of keen understanding of the principles and practices of dairying to raise a herd of cows that will average 500 lbs. of fat per year. We have cows, of course, that yield two and three times as much, but when a whole herd averages 500 lbs. fat, the man back of it possesses unusual dairy ability.

FLIRTING WITH DAIRY COW

In the past year or two many sections of the country have been giving more than passing notice to the dairy cow. In prosperous times these communities flirted with the dairy cow and a few men here and there accepted her as part of their farming operations.

A recent letter from one of our subscribers states that the community in which he lives lacks real dairy stock but does not care to invest in the highest priced cows. The thing really lacking in most communities that do not have dairy cows is genuine dairy sentiment. A man who prefers to grow wheat and does not like live stock, will not make a success with the dairy cow. Conferences, propaganda, and oratory will not develop the proper sentiment for dairying. It is something that must be, to some degree, at least, inherited. Then, by proper instruction and sound information, dairymen may be developed and successful dairy communities established. Wherever dairying has been a success it has been a gradual growth, building step by step.

We suspect many sections, which have been rather enthusiastic for the dairy cow, will now begin to turn a cold shoulder to her since the prices of wheat, corn, and hogs are coming to their own. Dairying is making substantial growth; it is moving forward in its total production as rapidly as it should. We need no brass bands or forcing methods to bring the cow into the hands of men who will give her the right kind of treatment in order to make a success with her.

POOR COWS AND SURPLUS MILK

The Virginia Extension Service in its work came across a dairy farmer milking 36 cows. It was found that eighteen of his cows were returning him a good profit and eighteen were being kept at a loss. It was also found that there is a surplus of milk in several of the cities in Virginia. The question comes, why should this Virginia farmer milk thirty-six cows when only eighteen of them were returning him a profit and the other eighteen were taking some of his hard earned cash for their keep. Further, these eighteen unprofitable cows were producing the surplus which helped to depress the prices of the milk of the entire community. Still we have men preaching and writing that efficiency will not solve the dairy farmers' problem.

Think about this Virginia farmer working hard, early and late, in order to earn enough money with the eighteen good cows to help pay the losses sustained by eighteen poor ones. If their injury would stop there, it wouldn't be so bad. No one would be penalized but the farmer himself.

Surplus milk comes from inefficient cows—those which do not pay for the cost of feed consumed. Surplus milk has in many instances depressed the price of all market milk and made it sell below the cost of production. There are many remedies for a situation of this character but the best one—and it is in control of the dairy farmer himself—is to dispose of all the cows that do not pay for feed consumed. There is no law forcing the dairy farmer to milk poor cows; there is no monopoly which forces him to keep them, and he cannot honestly blame any one because he keeps them. It would seem, as we survey the cow situation in this country, that a considerable number of men milking cows prefer some poor cows.

For more complete report see next page.

PITTSBURG PLUS VICTORY

Farm organizations are rejoicing over the decision of the Federal Trade Commission outlawing "Pittsburg Plus". In commenting upon this decision, the Illinois Agricultural Association says:

"It is conservatively estimated that the abolition of 'Pittsburg Plus' will save the farmers of Illinois over $3,000,000 each year and approximately the same result will apply to the other great agricultural states. The Federal Trade Commission, in rendering the decision, states that 'Pittsburg Plus' specifically adds $30,000,000 annually to the cost of steel products bought by farmers in eleven western states which include Illinois. Our farm bureau investigations show that approximately $55,000,000 is the amount of the annual saving effected for American farmers in the aggregate.

"This victory is conclusive proof that organized and united effort on the part of the farmers is necessary to overcome some of the difficulties which confront the American farmer. This decision could not have been accomplished without the united effort and influence of strong organization.

"It also demonstrates the wisdom of having farmers on the federal boards and commissions; men that can be depended upon as having the interests of America's basic industry at heart.

"The research department of the American Farm Bureau Federation is authority for the statement that the $30,000,000 annual saving to farmers in eleven states, as shown in the Federal Trade Commission's report, would pay all costs of running the Farm Bureau with its 1,800 county farm bureaus, 45 state organizations, and its national unit for 10 years."

COMMUNITY OWNERSHIP

America is noted for its development of labor saving devices and machinery for operating the land. Machinery has taken drudgery out of farming. There is scarcely any operation on the farm now that cannot be done by some kind of machinery. It doesn't always pay, however, for one farmer to purchase a machine for doing a certain type of work because there is not a sufficient volume of business on one farm to warrant the outlay of money. To get the most out of a piece of machinery it should be used considerably or the interest on the investment and the depreciation cost more than the machine will contribute. The milking machine, the hand separator, the rake, the manure spreader, and many others are in constant use on the dairy farm. There are machines like the threshing machine, the ensilage cutter, trucks, tractors, cement mixers, etc., which may be owned by a community.

There are advantages in forming a rural transportation company and having one truck do all the hauling for several farmers in the community. There is opportunity for a group of farmers to own a threshing machine. Small sized machines are being built, the kind most dairy farmers require. On account of their cows they cannot start to thresh early in the morning and they must quit early in the afternoon. The threshing is done very largely by dairy farmers by the exchange of help. If a half dozen or more buy a threshing machine together, the outlay is small and the work can be done when it is most convenient. The same can be said of other pieces of machinery that we have mentioned.

Concrete is an important material on the dairy farm and it is being commonly and extensively used. The cement mixer saves much hand labor and does the mixing better. A machine of this kind could be owned by a considerable number of farmers and even though they had but little concrete work to do each year it would adequately pay to have a machine for mixing concrete.

Already these ideas are being carried out, for we find farmers owning silage cutters, threshers, tractors, and various other kinds of machines in common. We believe there is opportunity to develop the community ownership idea to a greater extent than it is carried on at the present time. The dairy farmer has so much work which machinery can do that it will pay him better perhaps than any other farmer to co-operate with his neighbor in owning certain kinds of machinery.

WELL BALANCED PROGRAM

The National Grange is a well balanced farm organization. It not only gives attention to economic problems of the farm, laws that will give agriculture an equal opportunity with all other industries and to principles and practices which will place agriculture upon a sound business basis, but it also directs itself to educating its members in what constitutes sound Americanism. We take the following quotation from a Grange pamphlet:

"This is brought about by keeping the ideals of American citizenship constantly before the meetings and featuring phases of American history and accomplishments as regular program features in Grange gatherings. Granges everywhere devote at least one meeting a year to strictly patriotic topics, frequently entertain war veterans and allied organizations, and the Grange meetings provide a convenient forum for the discussion of many of the live public questions of the day.

"More than 30 years ago a Grange custom was established of displaying the national colors in every Grange hall, and a significant ruling has just been made by the Master of the National Grange to the effect that from now on no legal Grange meeting can be held in the United States unless the American flag, like the open Bible upon the altar, is in position in the hall. Hundreds of Granges repeat in unison the Pledge to the Flag as a part of their formal opening exercises, accompanied by singing of the national anthem. During the World War the Grange was a leading factor in hundreds of rural communities in carrying forward war work, and all its ritualistic and program teachings inculcate love of country and reverence for the flag."

It is well that farm organizations devote themselves to making agriculture more profitable, but in so doing they should not neglect the opportunity to teach the true principles of American citizenship and our form of government and its meaning. The chief reason for increased profits of farming is to permit the building of better farm homes that better men and women may be raised in them. The Grange shows itself a well balanced farm organization because its program and teachings encompass all the activities which are necessary to make its members capable farmers and good American citizens.

Foot and Mouth Disease Losses

Please give the number of dairy cattle (and other cattle if you have record) slaughtered in California this year on account of the foot and mouth disease and what they were valued at.

Colorado Springs, Colo. E. H. R.

This inquiry was referred to the U. S. Bureau of Animal Industry, which replies as follows:

"Up to the close of July 6, approximately 50,000 cattle had been appraised and slaughtered on account of being affected with or exposed to this disease. Of this number probably 40,000 were animals of the beef breeds, the remainder being of dairy types, but largely grade animals.

"We are not in position to give the exact figures at which these animals were appraised but from the data that have been assembled it appears that the average for beef cattle has been about $65 per animal and for the grade dairy cattle about $100 per animal, 50 per cent of the appraisement in each instance being paid by the federal government and 50 per cent by the state of California. One of the finest pure-bred herds of Holstein cattle in this country, that of Mr. Fred Hartsook of Los Angeles, contracted the disease and was slaughtered. The average appraisement on this herd, consisting of about 370 animals, was in round figures $427 per animal.

Butter and Butterfat Prices

Our creamery is paying its patrons 40 cents a pound for butterfat in sweet cream and sells its butter wholesale at 45 cents a pound. It has an output of 350 to 400 lbs. of butter a day. It also makes quite a lot of ice cream. They tell us they can't pay more because they have such a high overhead. They employ six men in the creamery (including the ice cream) and have four men to collect cream. Shouldn't they be able to pay at least butter price for butterfat?

Mercedes, Texas. H. F. B.

I would not be in position to make any statement as to what a local creamery should pay the producers for cream, as I am not well enough familiar with the cost of operation in the state of Texas. I can, however, make a statement in reference to what the relation is between the price received for the butter and price paid for butterfat in the state of Iowa. We have during the past year made a survey covering 115 of the Iowa creameries, and from this survey we have obtained the following results:

Creameries manufacturing less than 100,000 lbs. of butter per year paid .76 cents more per pound of butterfat than the butter netted at the creamery.

Creameries manufacturing from 100,000 to 200,000 lbs. of butter per year paid 3.10 cents above the butter price.

Creameries manufacturing from 200,000 to 300,000 lbs. of butter per year paid 4.10 cents above the butter price.

Creameries manufacturing from 300,000 to 400,000 lbs. of butter per year paid 4.61 cents above butter price.

Creameries manufacturing from 400,000 to 500,000 lbs. of butter per year paid 5.03 cents above butter price and creameries manufacturing over 500,000 lbs. per year paid 5.30 cents above the butter price.

This includes only co-operative creameries, declaring no profits. I am not ready to state that a co-operative creamery could be operated on an equal economic basis in Texas.

Iowa College of Agr. M. MORTENSON.

Surplus Milk and a Remedy

During the last few months the Washington and Richmond fluid milk markets have been flooded with the largest surplus in the history of these markets. This has made it necessary for the dealers to divert this large amount of surplus milk to manufacturing channels. As the prices received for these manufactured products have been relatively very low it reduced the general price level very considerably. This glutted condition also made for very unhealthy market conditions.

The best way to wipe out this surplus, and thus restore a normal and healthy market, would be by disposing of all "boarder" or unprofitable cows.

Cow testing association records are proving of immense value in helping dairymen to find out these "boarder" or unprofitable cows. Here is what the records of a 36-cow dairy shipping to the Washington market showed. The 36 cows had a total production of 213,744 lbs. milk, and 7,613.6 lbs. fat. This brought in a total return at the farm of $6,381.44. The total feed cost was $3,346.70, which left an income over feed cost of $3,034.74. After crediting the value of manure and calves and deducting all overhead charges it left a net profit of $1,124.53.

For each cow in the herd there was an average production of 6,048 lbs. milk, and 211.5 lbs. fat. A return of $177.26 was received at a feed cost of $92.96. Therefore the income over feed cost was $84.30 while the net profit was $31.24.

By dividing the herd in two parts and placing the records of the highest eighteen milk producers in one group, and the lowest eighteen milk producers in another group, some startling information was brought out. The cows in the first group produced 142,517 lbs. milk and made a total net profit of $1,322.46. The cows in the second group produced 71,227 lbs. milk and showed a net loss of $197.77. In other words, if this dairyman had had the first group of eighteen cows instead of having the whole herd of thirty-six, he would have been $199.77 better off at the end of the year and would have relieved the market of 71,227 lbs. milk during the year. With cows in the first group he was able to make milk at a feed cost of $1.36 per hundred, while with the cows in the second group, which were making the cheap, surplus milk, it cost $1.98 to produce one hundred pounds of milk.

When we consider that most of the herds in the country are about on the same footing as this herd, it can easily be seen that by getting rid of the "boarder" cow the surplus would disappear, market conditions would improve, the cost of production would be lowered, and profits would increase.

Virginia. L. P. EMMERICK.

Keeping the Ton Litter Healthy and Comfortable

Are some of the pigs in that prospective ton litter failing to make the proper gains? Do several of them show signs of unthriftiness, with a rough staring coat of hair, thinness of flesh, and a continuous cough?

If such is the case, the trouble may be due to infestation by the intestinal round worm. The best methods of treatment, as recommended by a number of experiment stations, are the use of oil of chenopodium or santonin. For a 50-lb. pig, 2 cubic centimeters of oil of chenopodium, well mixed with 15 cubic centimeters of castor oil, should be given. It is best administered with a dose syringe. For larger or smaller pigs, proportionate amounts should be used.

The dose of santonin is 5 grains for a 50-lb. pig. It is best given in a capsule with 2 grains of calomel. These capsules should be administered by means of a capsule gun and jaw spreader. Care must be taken to avoid lodgment of the capsule in the throat. The purgatives, such as castor oil, help to expel dead or stupified worms, and protect the animals from the bad effects of the vermifuge. All feed should be withheld from the pigs for 24 hours before treating. If any of the pigs of the Ton Litter are infested with round worms, treatment will be necessary before they can be expected to make their required weight.

Hog Lice Cause Misery

But perhaps the unthrifty condition is not caused by round worms or other internal parasites. The presence of hog lice or mange mites will make pigs miserable. If hog lice are present in large numbers, they will seriously irritate the animals, retard their growth, lessen their vitality, and lower their resistance to disease. The hog lice are found only on hogs and when separated from the animals they live only a few days. So practically all cases of infestation occur from contact with lousy animals. As a precautionary measure, however, the hog houses should be thoroughly cleaned and disinfected. The coal-tar-creosote dips, diluted according to instructions given on the containers, are suitable for this purpose.

As a treatment for lice, applications of crude petroleum, crank-case oil, and kerosene emulsion are good. For kerosene emulsion add 2 gallons of kerosene to one gallon of warm water, in which one-half pound of castile soap has been dissolved.

Use Oils for Treatment

Processed oils, preferably the thinner ones, may also be added. Fuel oil is often used, and its effectiveness increased by adding one quart of kerosene to five gallons of oil.

Where only a few animals are to be treated, the task may best be handled by applying crude oil by cloth or brush; or the hogs may be sprayed with crude petroleum oil, fuel oil, or kerosene emulsion, using an ordinary spray pump or hand sprinkler. Then if they are confined in a small pen, they will rub against each other and each hog will become thoroughly oiled.

A third method is dipping which requires wood or concrete vats. A vat 54 inches deep, 24 inches wide at the top, and 12-16 inches at the bottom is recommended. Its length at the bottom should be about 10 feet and at the top 20 feet. The dipping vat, filled with 40-44 inches of water, will allow for a 2- to 4-inch covering of oil on the surface.

Put Oil in Hog Wallow

A simpler method of treatment is to place crude oil in a cement hog wallow which is 7 to 8 inches deep. If a two-inch layer of crude oil is added to the water in the evening, it will have been taken up and smeared over the pigs' bodies before the sun becomes hot the following noon.

Even where no lice are present, a cement hog wallow can be of great value to the Ton Litter owner. Naturally the pigs will hunt the mud puddles in which to lie during the hot days. If these wallows were always clean, all would be fine. But too often they harbor disease germs. It will be far better to drain the mud wallows and build a shallow cement wallow, which is provided with a drain to keep it clean and sanitary.

The treatment given above will not destroy the eggs of the lice, so it is advisable to re-treat in 7 to 10 days. Where a few lice are present, but the litter or herd is not badly infested, mechanical oilers or rubbing posts wound with ropes or sacks that have been soaked in crude oil will keep the lice in check.

Mange Causes Sore Skins

Where the Ton Litter becomes infested with mange, more serious results will appear. There are two kinds of mange in pigs. One is caused by a mite too small to be seen without a magnifying glass. This tunnels into the deeper layers of the skin and deposits eggs. When these hatch they cause irritation and form blisters and scabs. The scabs first appear about the eyes, nose, and ears, and the root of the tail, and then gradually extend over the full length of the body. Often the skin becomes thickened into rough folds. The other mange mite burrows into the hair follicles, producing pustules that may break and discharge pus.

The mites and eggs are readily transmitted from one hog to another or from contaminated bedding or rubbing posts. The mange mites live for several weeks in pens or bedding if not exposed to direct sunlight. The first form of mange mite works on other farm animals as well as man.

Treat With Lime—Sulphur

The best remedy for mange is to first wash the animals thoroughly with soap and water and then dip them in lime-sulphur. This is prepared as follows: 12 lbs. of unslaked lime, 24 lbs. of sulphur, and sufficient water to make 100 gallons. Slake the lime with enough water to make a thin paste and add the sulphur. Then add the lime and sulphur paste to 30 gallons of boiling water and boil for 1½ to 2 hours. Stir frequently while boiling.

Allow the solution to stand until all the solids have settled. Then pour off the clear orange colored liquid and add enough water to make 100 gallons. Use while warm. If only a few pigs are to be treated, the dip may be applied to the entire body of the pig with a stiff brush. This treatment does not kill the eggs, so a second treatment should follow in six or seven days. After treatment the pigs should be placed in clean, disinfected quarters and given plenty of nourishing food.

Give Pigs a Fighting Chance

Where the Ton Litter pastures in a field without trees, artificial shade should be provided. A frame work of posts roofed over, or an open shed providing good circulation of air is good. With shade and ample supply of clean water to drink and good pasture, the pigs will reach their goal of a ton in six months much more readily than if kept in the old hog lot and required to frequent an old germ laden mud wallow in order to keep cool. Sanitation and comfort are needed to make a Ton Litter.—H. J. GRANT, Swine Extension Specialist, Wisconsin College of Agriculture.

Coming Events

Sept. 14-20—Eastern States Exposition at Springfield, Mass.
Sept. 27-Oct. 4—National Dairy Show, Milwaukee, Wis.
Sept. 22-28—Dairy Cattle Congress, Waterloo, Iowa.
Oct. 21-23—Wisconsin Buttermakers' Asso. meets at Chippewa Falls, Wis.
Nov. 1-8—Pacific International Live Stock Exposition, Portland, Ore.

Illinois Holstein Champion

Brownwood Pledge De Kol is now Illinois' leading Holstein cow for production in ten months as a senior four-year-old. Her record is 16,281.6 pounds milk containing 541.91 pounds butterfat—equal to 677.3 pounds butter. She is owned by H. M. Wood.—Extension Service Holstein-Friesian Ass'n. of America.

Creamery Institute to Aid Farmers

Establishment of a Creamery Institute as a potent factor for the advancement of the dairy industry—an educational institution to show the average farmer of the United States how to make more money and improve his dairying efforts—was announced here today by J. A. Walker, vice-president and directing head of the Blue Valley Creamery Company, who for more than thirty years has been one of the dominant forces in the dairy field of the nation. In making the announcement, Mr. Walker stated that he was considering turning over a considerable sum of money to be expended over a period of time toward building a greater dairy industry, emphasizing diversification, balanced farming, and more

J. A. WALKER

efficient methods with dairy cows, hogs, and hens.

Mr. Walker declared that the Creamery Institute would at once start an intensive educational campaign to increase the buying power of farmers in the Mississippi Valley by showing them how to manage a small herd of dairy cows in such a way as to provide an income equal to the wage received by the skilled laborer of the city who buys the butter. Expert dairymen and trained dairy scientists will be in charge of the various divisions of the Creamery Institute which will have its headquarters in Chicago. Branch offices will be established in many other cities.

"The time has come when American farmers have definitely passed the pioneer, soil-robbing stage of agriculture," said Mr. Walker. "From now on we must develop a soil-enriching, profit-making type of farming. The experiment stations, agricultural colleges, county agents, and farm bureaus declare that the dairy cow offers the quickest and safest means of insuring a steady and adequate farm return.

"The Mississippi Valley is the dimple of the universe. In this section, noted for its corn, hogs, and beef, we find that the cream can has outstripped them all as an actual profit maker for the farmer, but despite the fact that the creamery route offers the farmer his finest opportunity for ready and steady money, the consumer cannot get enough cream. This is due to the prejudice against pulling teats which arose in the days of huger pastures, unlimited range, and cowboys who drank canned milk.

"While we should be proud of what has been accomplished in the Mississippi Valley, we haven't made it produce half of what it should. To increase the dairy production in this area, as elsewhere, is the purpose of the Institute.

"There has been a rising tide of popularity in intensive farming. As agriculture is brought face to face with higher costs of production and farmers find that they cannot get by on high priced land, it has been necessary to turn to diversification, to small crops, and to the keeping of the cow, the sow, and the hen. Deflation has made every banker and farm leader see these things."

Washington, D. C., Weekly News

[Special to Hoard's Dairyman.]

Washington, Aug. 6—Dr. H. C. Taylor, chief of the Bureau of Agricultural Economics, and Mrs. Taylor, have returned from an extended European trip, Dr. Taylor going as the head of the American delegation to the International Institute of Agriculture, and remaining for economic study in Berlin, Denmark, and England. Dr. Taylor says that he is strongly impressed with changes for the better in Germany. He noted change in their general outlook on life, resumption of religious faith, realization of the real result of the war, and determination to work their way back to economic soundness and industrial rehabilitation.

⚜

Figures are now available from Department of Commerce sources to substantiate the report written some time ago that Germany was beginning to resume a place as a big importer of butter. Last year, her January to April intake from Denmark was stated at but 323,000 lbs.; this year for the same months it was 15,773,000 lbs., or more than one-fifth the total Danish export trade in butter.

⚜

Director C. A. Browne of the Bureau of Chemistry, U. S. D. A. who is in charge of all food and drug law enforcement, gives the food manufacturers a high compliment, in making public a review of 12 months' operation of the law enforcement section of his bureau. "The majority of manufacturers," he says, "are putting out high grade products, and there is a smaller percentage of adulteration than ever before."

Out of about 12,000 cases of seizures, eggs figured in about 600 and dairy products in over 1,000. No mention is made of a single seizure of adulterated cheese, but butter short in fat and in short weight packages came in for plenty of attention. He says that there is to be no let-up in the vigor of law enforcement.

⚜

An egg inspection service is being established this month at Chicago by the dairy and poultry section of the Department of Agriculture. This is to meet widespread demand for this service, growing out of its successful operation in New York where nearly 5,000 cases of eggs were inspected last month for steamship lines, government hospitals, the U. S. Navy, and big chain restaurants. Service is to be established later, according to Roy C. Potts in charge, in Philadelphia, Boston, and San Francisco.

⚜

Two interesting questions will come up here the week of Aug. 18 when the Joint Committee on Food Standards and Definitions meets the representatives of the Ice Cream Manufacturers' Association, to determine a proper standard and definition for ice cream. One is how much should it weigh per gallon? The other is, what kind of sweetening may be used? The manufacturers say that a constant weight per gallon can not be maintained, under modern manufacturing methods, and are asking for a minimum far below what the committee wishes to grant. The committee wants the sweetening to be limited to sucrose—plain cane or beet sugar—but the manufacturers say that the new product, corn sugar, or dextrose, is better, more healthful, and while not quite as sweet, provides other fine qualities, and should be permitted. The hearing is likely to be held on Aug. 20.

At Milking Time

The shadows round the barn are long
And birds take up their evening song
At milking time;
The air is soft
And sweet and cool
Like liquid from
Some magic pool,
The clouds are tinged
With color red
And trees are still
To silence wed
At milking time.

The cows are waiting in the yard
While at their backs a lane is barred
At milking time;
The mill is dead
But now and then
An anxious cow
Is asking when,
And swooping low
A bat is seen
Against the dusk
Of Twilight's screen
At milking time.

And then the door is swung aside
And stanchions creak before the tide
At milking time;
The rafters ring
With noisy shouts
While bossies get
Mixed in their routes,
And hungry cats
Come 'round and sit
Until of milk
They've had their bit
At milking time.

A pitter patter strikes the pail
Like raindrops in an August gale,
At milking time;
A music strange
That stirs the blood
To measured beats
Of chewing cud
Sweeps down the aisle,
Lifts to the beams
And reaches to
The stars it seems
At milking time.

In words forgotten and tune all wrong
A raspy voice bursts out in song
At milking time;
The cares fly by
The worries cease
A furrowed brow
Forgets its crease—
For after all
It's good to be
Healthy, happy,
Strong and free
At milking time.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Overproduction — No Such Anima!

HOARD'S DAIRYMAN:—I cannot help but cross swords with the writer of "Our Farmers Efficient" where he talks about overproduction. I claim there is no such thing. I have been among about all classes of society and seen thousands who did not have enough to eat, seldom had a full meal. Take the reports of our school officials who have investigated the condition of the children—they have found thousands who did not get enough to study on. One teacher in our city told me they had milk brought to the school and many children got it to drink and after a time many of them did much better in their studying; other cities have reported the same. The government report gotten out some years ago before the war, stated we produce collectively $1172 worth of wealth per day, but get back the huge sum of $252 per day collectively. That report took in those fellows who got up to $30,000 per year.

I have been in over 25 states of this Union and have kept my eyes open, at least tried to, and seen the condition of many people, seen much produce go to waste, and at the same time thousands at the verge of starvation. Why, because they did not get enough wages to buy back what they produced—then it's called overproduction; there is no such animal.

In this city, last year, many men were laid off at the factories, some lost what little they had paid on a house. They were willing to work, but those same factory managers would keep men from other towns steady at work. We have several car loads of men from outside towns come every day to work and our own men walk the streets. Why? It will not do to allow men to have anything ahead. They might ask for more wages. It's a well known fact—take us working men collectively, we are just two weeks from starvation. Thousands pay their grocery bills weekly, they cannot pay cash. Would not those people eat more if they got the wherewithal to buy it with? Is it just that some men should be allowed to pile up 9 millions a year and their workmen almost starve?

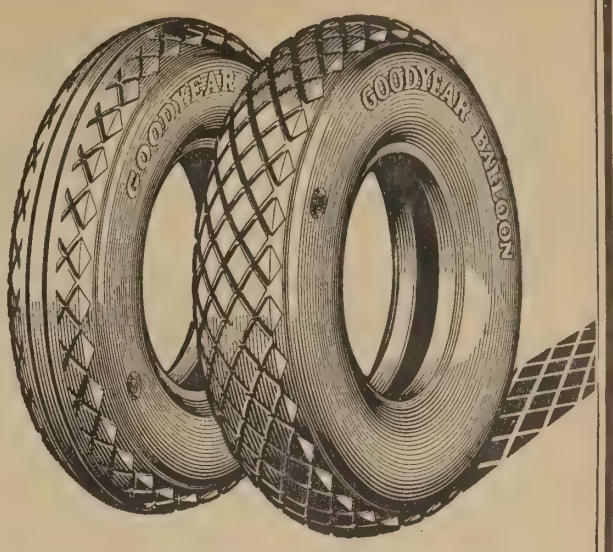
In the future talk about under consumption. If the workers were getting what they should the farmer would not be in such a position as he is financially. I consider the R. R. are to blame for much of our depression. I will cite a case; it holds good today.

Some years ago I thought I would get a carload of potatoes from Mauston, this state. They were selling at 50 cents in Kenosha but 19 cents there; looked up the freight rates and they were 33 cents per hundred, and at the same time wheat was being moved from Duluth to the seaboard for 6 cents per bu. You ask a R. R. manager what he bases his rates at and he will tell you, if honest, it's all the traffic will stand. What good is our R. R. commission? If the facts were known most of them hold their positions from big corporation influence. This state has a few commissions to spare.

Wisconsin. JAS. H. BIRCHARD.

Slipped on Thinking

HOARD'S DAIRYMAN:—Mr. Klein's and Mr. Dill's articles both make interesting reading but I wonder if they haven't slipped a little on their thinking. They seem to assume that the only way to counter an uppercut is with another uppercut. Organized labor and business monopolies have very perceptibly won a temporary advantage by a policy of restricted output. But taking Mr. Klein's manner or reasoning in June 27th issue, suppose all the farmers did cut production to one-half its present volume. Of course prices go up following the law of supply and demand. And then what? Well, there would be such a stampede into the various farm enterprises as followed the war time dairy prices. The result would be a tremendous overproduction just like we are suffering from now.



You may say this hasn't visibly followed in other lines. All I can add here is, that stampedes of this sort do not occur as readily where it requires the price of a railroad to get into the business. But every Tom, Dick, or Harry can muster the price of a cow, and two cows on a farm where only one stayed before (I was about to say kept) may not double the supply but it will produce enough glut on the market to take the fit out of profit. As a matter of fact such a stampede has occurred in big finance as they call it, as witness the financial desert of the railroads and the heated financial petting party going on in Tax Exempts Avenue.

Maybe you can think of the situation as a fellow standing between two arms of a well oiled sweep, or tread power. Let the sweep in its entirety represent production in any one line or all lines of commodities. Suppose you mill around half as fast. You will cut production or output all right but get right back where I described above. Or, standing between the arms several have proposed and tried doing other things. If the arm in front of you represents Price for Product, join hands and give it a push but you'll find the Cost of Production arm right behind you following steadily upwards or onwards. Give it a sudden shove ahead and you may get a clip back of the ear. As I see it, the real difficulty, though it is not always recognized, is that we are crowded for elbow room between the arms. And the logical as well as practical thing to do is push the arms farther apart—increase the "spread" between cost of producing and best price obtainable—or if that can't be done to get out.

An up and coming farm youngster analyzing his poultry account in vocational agriculture expressed the idea of "spread" very tersely when he said, "I don't care where the price of poultry products go as long as I can make 10 per cent above the actual cost of producing them." All this means having necessary farm accounts for knowing what the *actual* costs are. It's no use complaining they take too much time. Fact is, an increasing number of successful farmers are keeping them and those who don't are facing a new kind of competition. For those who prefer the direct counter offensive here is a hint. I think seriously that both Mr. Klein and Mr. Dill will agree that anything less than such a program would be like clipping a man's head to stop his hair from growing so fast!

Connecticut. R. L. HAHN.

Aunt Ada's Axioms: Those who are discontented with home should remember that the pleasantest place to live is in the hearts of others.

SUPERTWIST

is a new word in the tire industry and a mighty important one. It is the name of the sensational new cord fabric developed by Goodyear. Tests show that tires made with this elastic and enduring new material *delivered as much as 100% greater* carcass *service* than tires made with an equal number of plies of standard cord fabric. In other words, ply for ply, SUPERTWIST literally *doubled* the *carcass* life of the tire. SUPERTWIST is used only by Goodyear, and is built into Goodyear balloon tires of *both* kinds—to fit new wheels, or the wheels now on your car.

Goodyear Means Good Wear

GOODYEAR

A Window to the South

A Wisconsin woman has written a play, just a simple but beautiful one, called "A Window to the South". The farm mother in the play has a kitchen window that looks out on the barn lot and it is a very unlovely sight. She longs for a window to the south. There the view shows Nature alone and brings back loving thoughts of the time when as a bride she drove with her husband to the little home in the cut-over country.

Her husband is always too busy to cut the window for her and she is too gentle to demand it. But she pictures to herself how beautiful her work would become if only she could see the trees and the open sky. She dreams of it until her family discover one day that she believes the window is there and she talks about it in a happy, daft way.

How many farm women there are, kept at home by little children or other duties, wanting things and doing without them until, for one reason or other, it is too late.

We all want to practice the right amount of self-denial and we all heartily condemn the self-centered exacting woman who demads all and gives as little as possible. But there are many, many things that cost little, either in effort or money, and that would make us happier.

True happiness can never be built on injustice and so I feel that it is all right for us to go after anything that will make us happy in the right way. If we must stay at home, let us make our homes nice places to stay in. Only so can we enjoy them.

The most interesting place to start around the home is the yard if it is summer. If the men think they are too busy to help, the mother and children can do a great deal. My idea of a good beginning is a fence around the yard. That sort of sets off the work of the woman. Nothing is lovelier for this than white pickets if they are harmonious with the house, though a wire fence, covered with vines, is pretty, too.

Walks about the place do help such a lot in keeping the house clean. Some of the handsomest homes have walks of flag stones laid like the old-fashioned stepping stones. Brick walks are artistic and not expensive and then there are always the concrete, cinder, and gravel that may be used. It does look as if the men would have to lend a hand with the walks and fence but the mother and children can give moral aid.

If the yard is large be sure to leave a fence opening big enough so that the mowing machine can drive in to cut the grass. It does look as if this was going to involve the men again but then it is hard to get along without them and we might as well admit it.

Since we have admitted it, they are probably so flattered that they will help build a little grape arbor in the side or back yard. Many of the lovely old places had them but we hurry around so fast nowdays that we don't have time to use them any more and not many are built.

This little structure can be the simplest possible. Just four stout timbers set in a square and two extra ones to form a door. Then the whole thing covered, top and sides, with lath or something similar placed a foot or two apart, just anything to give support to the vines that are to grow over it.

Grape is the nicest of all but it takes a long time to grow. I have heard of an annual called the Japanese Kudzu that climbs almost as fast as the story-book bean stalk and forms a cover in two months.

Inside this little house there must be a bench on either side and a table, no matter how old, so that you will be tempted to carry your mending there. This is a soul-satisfying spot in which to shell peas or do other tedious work.

Sunlight that is not too strong and that does not come through glass is as good as medicine, the doctors say nowdays, and I believe that most anyone can find 15 minutes on a summer afternoon in which to strecth out on one of the benches and soak up sun. I don't mean that sunlight through glass is harmful but only that the glass takes out the valuable ultra-violet ray. A bird bath that the children can renew every day and a row of hardy flowers that don't take any care but, like Topsy, just grow, will rest your eye while you are working.

Don't be vaguely dissatisfied with your home. Figure out what it is that would make it nicer and you happier and then concentrate on ways of getting it. You will be surprised how soon you will have it.—LUCY THOMPSON.

Ice Cream Recipes

Home-made ice cream is always a treat. Besides, it's a way to use more milk and cream in the children's diet.

Here are some recipes suitable for one-quart freezers, suggested by Miss Bernice Dodge of the Home Economics Department of the University of Wisconsin:

Lemon Milk Sherbet—2 cups milk, ¾ cup sugar, juice of 1½ lemons. (1) Mix lemon juice and sugar. (2) Add this slowly to milk, stirring constantly. (3) Freeze packing with a mixture of 3 parts cracked ice to one part rock salt.

Philadelphia Ice Cream—½ cup cream, 2 cups milk, ½ cup sugar, 2 teaspoons vanilla. (1) Scald milk and cream together. (2) Add sugar and vanilla, after cooling. (3) Freeze, using 3 parts cracked ice to one part rock salt.

Chocolate Ice Cream—2½ tablespoons cocoa, ½ cup sugar, 2 tablespoons water, 1 cup cream, 1½ cups milk, speck of salt, ½ tablespoon vanilla. (1) Mix cocoa, sugar, and water, and cook till creamy, stirring constantly. (2) Scald milk and cream together. (3) Add cocoa mixture to hot milk and stir till smooth. (4) Cool, add vanilla and salt, and freeze, using three parts cracked ice to one part rock salt.

Hot Fudge Sauce for Ice Cream—Take equal parts of cocoa, sugar, and milk and cook till thick and creamy, stirring constantly. Pour hot over the ice cream.

Shorts

Add the white of an egg to cream that will not whip and note the success you will have with your cream.

⚜

Two teaspoonfuls of cream of tartar and one scant teaspoon of saleratus are equal to three teaspoons of baking powder.

⚜

Put ham and corned beef on to boil in cold water.

⚜

Tomatoes are good when stuffed with pork sausage and baked.

⚜

To make croutons take slices of stale bread and cut into one-half inch dice. Put into a shallow pan and bake in a moderate oven until golden brown.

⚜

Every trace of string can be removed from string beans if, after thorough washing, you plunge them into boiling water for five minutes, then drain. Then the strings are easily removed.

⚜

A few pieces of dried rind of orange kept in your tea canister will give your tea a delicious fragrance and flavor.

⚜

If you are cutting down on the number of eggs in a cake, add half a teaspoon of baking powder for each egg-white omitted.

⚜

When making sherbets or ices, try adding the stiffly beaten white of an egg to each quart of mixture. It will give you a lovely, smooth ice.

⚜

The jellied salad acts as a welcome substitute for dessert at times. Apples, nuts, and celery, chopped raw cabbage or raw carrots can be molded into lemon jelly which is delicious served on crisp lettuce with mayonnaise dressing.

⚜

Soft butter or lard should never be used in making pie crust. Whatever shortening is used should be hard and very cold.

⚜

Currant jelly is very good when served with any kind of meat. If you are serving in large quantities a light and a dark jelly cut into squares and served on the same plate makes an attractive way to serve jelly.

⚜

Fruits and desserts sweetened with honey make an agreeable change.

⚜

The first vegetables a child should have are the strained pulp of spinach, asparagus, peas, and young carrots.

⚜

Add a cup of grated cheese to the white sauce for cauliflower and see if you don't find it a very pleasant addition.

⚜

Over alternate layers of chopped spinach or cabbage and cooked noodles or macaroni, sprinkle grated cheese and seasonings. Add a cupful of milk and bake in a moderate oven for about twenty minutes.—Sophia K. Ormond.

One of the weakest points in home life in the present day is the lack of understanding of human relationships.—FLORA ROSE.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Miscellaneous Fashions

No. 1957—Becoming Design. Cut in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 requires 2⅝ yards 36-inch material with 1⅝ yards 24-inch contrasting.

No. 2084—Easily Made Style. Cut in sizes 16 years, 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 requires 2¼ yards 36-inch material with 2⅛ yards 36-inch contrasting.

No. 1685—Becoming Porch Dress. Cut in sizes 36, 38, 40, 42, 44, 46, 48, and 50 inches bust measure. Size 40 requires 4 yards 36-inch material with 1 yard 36-inch contrasting.

No. 2103—Bloomer Dress for Pudgy Youngsters. Cut in sizes 2, 4, 6, and 8 years. Size 4 requires 2 yards 40-inch material.

No. 2148—Cool Frock for Hot Days. Cut in sizes 16 years, 36, 38, 40, and 42 inches bust measure. Size 36 requires 3½ yards 40-inch material with 1⅞ yards of ribbon.

No. 2139—One-Piece, Slip-On Dresse. The diagram will convince you of the simple construction of this dress. Cut in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 requires 3⅜ yards of 40-inch material.

Fashion Magazine

From the front cover of our Spring and Summer Fashion Magazine right on through the book, you will see all of the styles which will be popular during the coming season. Styles for morning and afternoon wear as well as those needed for the more formal occasions. And cute styles for the kiddies. There are dressmaking lessons for the beginner, and charming styles which can be made in a couple of hours even by one who is a novice with the needle. Also photos of the most popular Broadway, New York, actresses. So settle your dress problems by sending 10c today for our new Fashion Magazine. You'll save dollars by doing so. Address Fashion Department, Hoard's Dairyman, Fort Atkinson.

Where children are, there is the golden age.—NOVALIS.

Ever Failing or Never Failing Pasture

(Continued from page 99)

the barn feeding for the summer six months could be avoided. The dairyman would gain two or three weeks' time in the spring by being able to turn out earlier; then in mid-summer the sweet clover would withstand the drought and supply ample feed during the hot weather, and thus save a month or two of barn feeding that would be necessary if bluegrass were relied upon; and in the fall the sweet clover would allow two or three weeks later pasturing. By growing sweet clover in the place of bluegrass, this pasture feeding period is extended from two months to six months—or four months longer—and no supplementary feeding of roughage in the barn is needed, thus saving four months of barn feeding labor through the busy season of crop work, and the labor of growing, harvesting, and storing this summer feed is also saved.

Saves One Hired Hand

Thus, in many cases the use of sweet clover pasture would save one hand's wages and his board, room, and washing. It certainly would enable the dairyman to keep a larger herd or do more work in growing extra crops for sale with the same labor force. It would enable many a dairyman, now hiring some help, to conduct a one-man farm or reduce his help from two hired men to one. There is not only the money value of the labor saved, but the greater independence in regard to labor and freedom from anxiety about it, for sometimes it is impossible to get good labor, regardless of price, and the dairyman is put under great stress and handicap in working alone for weeks.

This is the greatest possible means of saving labor on the dairy farm, where labor is a most costly and valuable commodity, and the most difficult to satisfactorily supply. Sweet clover pasture is the best hand on the farm.

More Economical Than Hogging Down Corn

Everyone knows that hogging down corn is a great saving of labor, but pasturing cows on sweet clover is a far greater labor saving method. The hogs save only the husking and shelling of the corn, comparatively cheap operations; while cows on sweet clover pasture save the work of making hay and silage, the threshing, shelling, and grinding of grain, which are expensive and laborious operations.

What Dairymen Say About It

The following quotations will show how dairymen find sweet clover pasture furnishes plenty of summer feed and thus saves the labor that is involved in providing supplementary feed when bluegrass fails.

"Sweet clover is a whole lot better than bluegrass because it gives not only more feed per acre but also makes the pasture extend over a much longer season."—Theo. Warnecke, Southern Illinois.

"Bluegrass can not be compared with sweet clover. I intend to plow up my bluegrass pasture and use sweet clover entirely because it starts earlier in the spring and produces more feed in the summer when our bluegrass is dried up."—Edw. S. Stumpf, Southern Illinois.

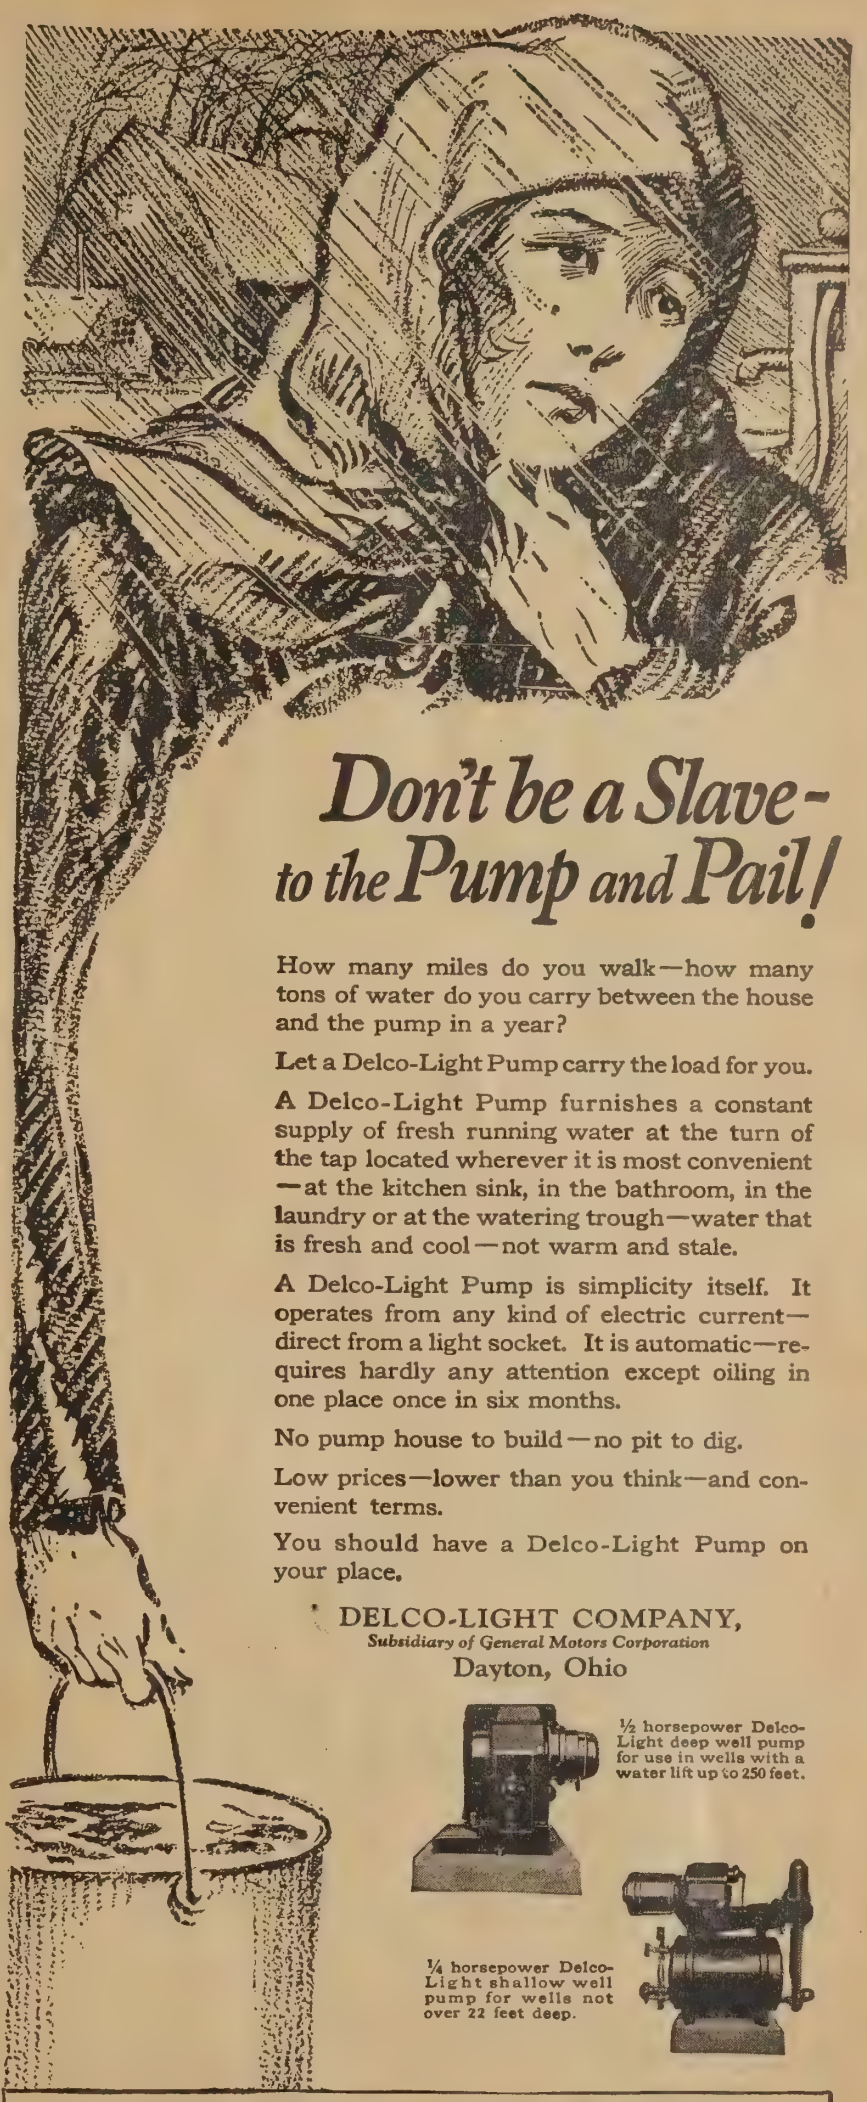
"When all the other pastures are burned up on account of the lack of rain and intense heat, I always have plenty of feed with sweet clover pasture, thus saving supplementary feeding."—J. J. Kennedy, Northern Illinois.

"The reason we like sweet clover for pasture much better than bluegrass is because it gives plenty of feed during the dry months, and also holds the ~ - of milk steadier during the season."—Thomas Thorson, Northern Illinois.

"Bluegrass is good only on swampy land which is wet all the time. On ordinary land, bluegrass will dry up during hot weather when it gets dry because it feeds only in a few inches of the top soil, while sweet clover roots go down into the sub-soil and get moisture as long as there is any there. We can raise sweet clover on the poorest land if it has had sufficient lime, where bluegrass dries up. A good sweet clover pasture aids greatly in growing a good corn crop the following year. We get double the yield of both wheat and corn following sweet clover pasture, that we did before we raised sweet clover."—Ed. Rehling, Southern Illinois.

A Question to Answer

Why should any man want to put in all this extra labor raising supplementary feed, particularly when it comes right at the peak of the year's work in the heavy harvest season? This is entirely unnecessary with sweet clover pasture. Why should any man want to enslave himself and his family or try to hire extra help when it is so scarce and high-priced, often unsatisfactory and annoying? That is a fair question, and the only possible answer seems to be that he does not understand what this wonderful crop will do toward lightening his year's labor load, or else he does not see how easily he can grow this legume pasture upon his farm.



One of the chief difficulties in dairy farming is the large amount of labor necessarily involved in the cropping season. This sweet clover pasture saving of labor is certainly a large step in the direction of reducing the peak of the labor load, because it removes the bluegrass burden for four months and makes a real pasture period equal in length to the winter feeding period.

Milking Machines and Caked Udder

HOARD'S DAIRYMAN:—In your June 6th issue I read an article on milking machine trouble with caked udders. I have had the same trouble with my machine but have discovered the reason of the caking of udders with milking machines. T. R. N. describes the trouble O. K. It is not garget which I thought at first it was, but the trouble is not enough power to furnish the correct suction or otherwise too much suction. Some cows have a very tender udder and should be watched at all times and see that all four teats are milking out alike.

Now for proof: I have one cow that will cake very easily if the machine is not working perfectly. Yesterday morning her udder was caked. I knew there was something wrong so I got busy and watched it close and learned that one of the milkers was leaking, not much but enough to suck air. This can be noticed by bending the two milkers back and holding them, then put your thumbs in the other two and turn on the machine. If the rubber in the milker leaks it will suck air and you can feel it. If the trouble is too much suction or not enough you can discover it if the operator is familiar with his machine.

Don't be a Slave-to the Pump and Pail!

How many miles do you walk—how many tons of water do you carry between the house and the pump in a year?

Let a Delco-Light Pump carry the load for you.

A Delco-Light Pump furnishes a constant supply of fresh running water at the turn of the tap located wherever it is most convenient—at the kitchen sink, in the bathroom, in the laundry or at the watering trough—water that is fresh and cool—not warm and stale.

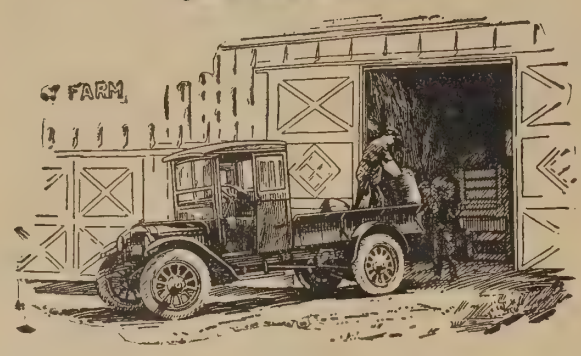
A Delco-Light Pump is simplicity itself. It operates from any kind of electric current—direct from a light socket. It is automatic—requires hardly any attention except oiling in one place once in six months.

No pump house to build—no pit to dig.

Low prices—lower than you think—and convenient terms.

You should have a Delco-Light Pump on your place.

DELCO-LIGHT COMPANY,
Subsidiary of General Motors Corporation
Dayton, Ohio



½ horsepower Delco-Light deep well pump for use in wells with a water lift up to 250 feet.

¼ horsepower Delco-Light shallow well pump for wells not over 22 feet deep.

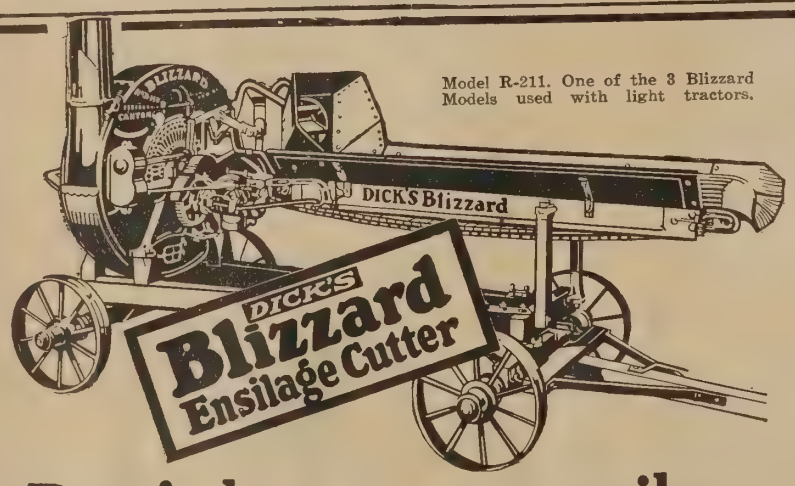
General Motors Trucks

Ready to Go When You Are!



Because of the perishable nature of dairy products and because of the day-in, day-out reliability of GMC trucks they are a logical selection for dairy farm needs. This extreme dependability is obtainable at a substantial saving in price. The GMC price is lower than that of other high grade trucks. Participation in the vast purchasing resources of General Motors Corporation cuts GMC production costs to the very bone.

Put it squarely up to a GMC to take charge of your hauling and cut the expense of doing it. You will be glad you did it at least 365 days a year. Ask for a catalog.

GENERAL MOTORS TRUCK COMPANY
Division of General Motors Corporation
PONTIAC, MICHIGAN

GMC

GMC Trucks are "Seven Steps Ahead"

Model R-211. One of the 3 Blizzard Models used with light tractors.

Don't lose your ensilage

Play safe. Corn is late. Don't let frost cost you hard-earned money.

Be ready with your own Blizzard Ensilage Cutter

Your Blizzard Dealer has a real proposition for you

Dick's Blizzards are lightest running. Do most work per H. P. Are safest to operate. Longest lasting. Do finest work. Elevate any heights.

Use light tractor for power

Three special Blizzard models for use with tractors, cut and elevate 6 to 13 tons per hour. Four other models give capacities of 4 to 35 tons per hour on 3½ to 18 H. P.

Write for catalog and name of nearest dealer, if you don't know him.

DAIRY MARKET NEWS

Cheese Markets

(Report by U. S. Dept. of Agr.)

Cheese markets continued firm with active demand during week ending August 2nd. Wisconsin production heavy with prospects for heavy make throughout August. Pastures in good shape following abundant rains.

The average wholesale prices on American cheese, style Twins, for the week ending Aug. 2, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending Aug. 2 1924	July 26 1924	Aug. 2 1923
	Cts.	Cts.	Cts.
New York	20.9	40.7	24.3
Chicago	18.8	18.1	21.7
Boston	21.2	21.2	25.2
San Francisco	18.4	19.0	24.7
Wisconsin Boards	18.3	17.9	21.1

The receipts of cheese at these markets were 5,079,940 lbs. for the week as compared with 5,360,738 lbs. last week and 5,465,556 lbs. a year ago.

Butter Markets

(Report by U. S. Dept. of Agr.)

Butter markets were unsettled and irregular during the week ending August 2. Tone at the close easy to weak. Sentiment mixed but anticipation of lower prices kept some buyers off the market. Production holding up well. Import situation unimportant.

The average wholesale prices on 92-score butter for the week ending Aug. 2, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending Aug. 2 1924	July 26 1924	Aug. 2 1923
	Cts.	Cts.	Cts.
New York	37.9	38.7	42.5
Chicago	36.1	36.7	41.4
Philadelphia	38.8	39.6	43.0
Boston	38.2	39.1	42.4
San Francisco	38.3	38.9	43.1

The receipts of butter at these markets were 19,356,666 lbs. for the week as compared with 20,469,097 lbs. for last week and 13,659,436 lbs. a year ago.

Cheese Prices for July

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices for American cheese (style Twins) for the three large markets in July:

	Average price July 1924	July 1923
	cents	cents
Wisconsin Boards	17.8	21.3
Chicago	18.4	21.8
New York		24.9

Longhorns averaged 18.3 cents in July on the Wisconsin Boards as compared with 18.8 cents in June and 22.5 cents in July a year ago. The receipts of cheese at Chicago, New York, Boston, and Philadelphia totaled 121,650,938 lbs. for the first seven months of the year as compared with 122,628,196 lbs. for the same period last year. Storage holdings at these markets on August 1 were 21,950,356 lbs. as compared with 21,179,573 lbs. a year ago.

Milwaukee Milk Prices

The following milk prices are determined on for the month of July:

For the portion sold as fluid, $2.85 per cwt. shall be paid for milk testing 3.5 per cent fat.

For the portion manufactured, $1.45 per cwt. shall be paid for 3.5 per cent fat. Four cents added or subtracted for each one-tenth of one per cent variation up or down from 3.5 fat test.

Sixty per cent of the total receipts was sold as fluid.—Milwaukee Co-operative Milk Producers.

Butter Prices for July

The following table is compiled from daily quotations by the U. S. Department of Agriculture and covers the average wholesale prices during July on 92-score butter (extras) at four of the principal markets, together with the receipts and storage holdings at these markets:

	Average price July 1924	July 1923	Receipts July 1924	July 1923
	cents	cents	tubs	tubs
Chicago	37.9	38.3	439,599	333,408
New York	38.3	39.5	444,827	376,243
Boston	40.2	39.7	202,230	175,822
Philadelphia	40.7	40.2	131,688	85,954
Total receipts for July			1,218,344	971,427
Total receipts since Jan. 1			5,861,017	5,466,736
Storage holdings Aug. 1			1,192,608	853,303

Ninety-score butter averaged 36.8 cents for July in Chicago, with centralized butter at this market selling for 37.8 cents. Jobbers' prices on extras sold to retailers averaged 40.4 cents in Chicago and 43.3 cents in New York.

CHICAGO, Aug. 7—With a good demand reported on all grades, the butter market today continued firm, with trading active. Receipts were heavier today, but supplies on dealers' floors remained light, receivers getting premiums on the medium and lower scores. The centralized car market continued firm, with offerings of 89 and 90 scores light and demand good.

Fresh butter—92-score, 36½c; 91-score, 35½c; 90-score, 34¾c; 89-score, 34¼c; 88-score, 33½c; 87-score, 33c; 86-score, 32c. Centralized carlots—90-score, 36c; 89-score, 34½c; 88-score, 33½c.

MILWAUKEE, Aug. 11—Butter—Creamery, extra, tubs, 36c; standards, 35½c; extra firsts, tubs, 34@35c; firsts, 32@33c; seconds, 30@31c.

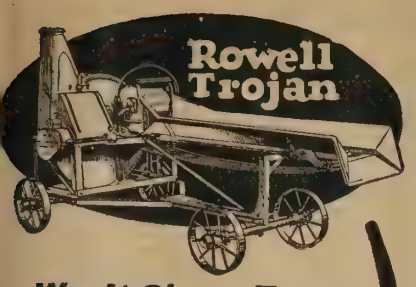
Eggs—Fresh gathered firsts (new cases), including cases candled, 29@29½c; ordinary firsts (standard cases), 28@28½c; miscellaneous lots, shippers' cases returned, candled, 26@27c; seconds, dirties, 21@21½c; checks, 21@21½c.

Cheese—American full cream, Twins, 18@18½c; Young Americas, 19@19½c; Longhorns, 19@19½c; Daisies, single, 18½@19c; American, 32c; Pimento, 34c; Swiss, 42c; Brick, fancy, 16@16½c; Limburger, new, 18@19c; imported Swiss loaf, 42@47c.

FOND DU LAC, Wis., Aug. 9—Average cheese prices (majority of sales), f. o. b. shipping point: Flats, 19½c; single Daisies, 19½c; double Daisies, 19c; Longhorns, 19½c; square prints, 20c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Aug. 9: Single Daisies, 18¼@18⅜c.

NEW YORK, Aug. 11—Butter—Firm; receipts, 10,285 tubs; fresh supply, 51,002 tubs; creamery extras, 38½c; specials, 39½.



Eggs—Quiet; receipts, 6,483 cases; fresh supply, 62,988 cases; white, fancy, 51@52c; fresh firsts, 29½@37c; western whites, 32@50c.

Cheese—Quiet; state milk, common to specials, 15@23c; skims, common to specials, 11@12c; lower grades, 4@10c.

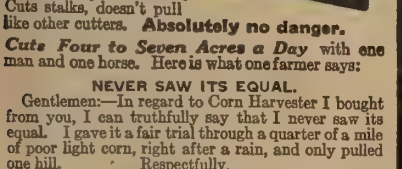
Won't Clog — Even on Tallest Silos

High or low; broad or slender—the height or shape of a silo makes no difference to the Rowell Trojan Silo Filler. Its sure-cutting, fly-wheel-mounted knives slash cleanly through the toughest stalks. The full-blast fan and lifting paddles shoot the ensilage up into the tallest silo. No "back dropping" or clogging.

Hyatt roller bearings make the Trojan hum as smoothly as a top. A light tractor such as the Fordson handles any of the three sizes easily, cutting and lifting from 8 to 17 tons of silage per hour. Rugged, twist-proof Trojan steel main frame keeps all working parts "in true" and lasts a lifetime. End-thrust bearings take up excess play. Automatic safety pulley release protects machine and operator. Automatic feeder requires no one at feed table—*it's a real one-man cutter!*



This is the machine you *need* and *want*. Write for free descriptive booklet.

Builders of Quality Farm Implements Since 1870

The PERFECT CORN HARVESTER

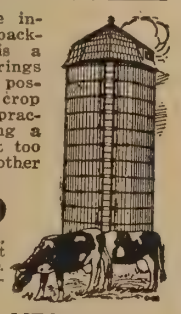
Sold Direct $21.75 JUST the THING for SHOCK or SILO CUTTING

Works in any kind of soil. Cuts stalks, doesn't pull like other cutters. **Absolutely no danger.**

Cuts Four to Seven Acres a Day with one man and one horse. Here is what one farmer says:

NEVER SAW ITS EQUAL.

Gentlemen:—In regard to Corn Harvester I bought from you, I can truthfully say that I never saw its equal. I gave it a fair trial through a quarter of a mile of poor light corn, right after a rain, and only pulled one hill. Respectfully,
T. M. DOUGLAS, Coulterville, Ill.



SOLD DIRECT TO THE FARMER

Send for booklet and circulars telling all about this labor-saving machine; also testimonials of many users.

LOVE MANUFACTURING COMPANY
Dept. 39 Lincoln, Illinois

Save Your Corn Crop

The most positive insurance against a backward corn crop is a GOOD SILO; it brings the greatest returns possible on a good crop and is the ONLY practical means of using a poor one. It is not too late to put up another silo this year.

The GEHL SILO

Is simple, economical, efficient and easily put up in a day or two. Write for full information and prices.

Anthrax in the South

HOARD'S DAIRYMAN:—With more than 50 counties affected in Mississippi, Arkansas, and Tennessee—with more than 2,000 head of stock and eight people dead from the disease in Mississippi alone—federal, state, and county officials are making desperate efforts to hold the present outbreak of anthrax in check and prevent its spread over the entire South.

The outbreak—which started in the delta section of Mississippi—is considered by southern veterinarians and live stock men to be one of the worst ever occurring in the South. In the course of a few weeks it has spread into three states and unless heroic measures are taken, it promises to spread over a still wider area before checked by cold weather.

Work in combatting the disease is being hampered by a lack of funds and a shortage of trained veterinarians. Every available veterinarian in Mississippi, Arkansas, and Tennessee is in the field and veterinarians from neighboring states are aiding them as much as they can.

Appeals have been made by officials of the three states affected to their respective legislatures for emergency funds with which to carry on the fight, and an appeal will be made to Secretary Wallace for more federal aid in the epidemic under control.

The following recommendations have been sent out to all farmers engaged in the fight and it is claimed that if they are followed, the disease can be held in check for the time being:

1. Report all cases of anthrax promptly.
2. Have laboratory tests made to determine the infection.
3. Destroy by burning all dead stock believed or known to have been infected.
4. Kill all stray dogs, vultures, and suspected carriers of the disease and spray for horse and cattle flies which can transmit the disease from herd to herd.
5. Segregate herds and isolate all dairy cattle.
6. Vaccinate all stock in the spring months to prevent a recurrence of the disease next year.

It is pretty generally considered that the anthrax has gotten too wide a start this year to be stopped and veterinarians are bending every effort just to hold it in check and prevent its spread to other sections.

With appropriations, an adequate field force in the three states, and a campaign of vaccination throughout the sections infected next spring, however, veterinarians say that it can be effectively eradicated.

Meanwhile the loss to farmers of Mississippi and Arkansas in hogs, beef, and dairy cattle and mules, while not officially estimated, is said to mount into the millions and live stock in the section has suffered a serious setback.

Georgia. J. H. REED.

Waukesha—Milwaukee Co. Holstein Picnic

The Waukesha and Milwaukee County Holstein Breeders' Ass'n held a joint picnic meeting at the Milwaukee County Agricultural School, Wauwautosa, Wis., Aug. 2. It was an ideal place for such a meeting, the weather was right, and the program was good, but the attendance was not up to standard perhaps because the weather was good and field work pressing.

Just before lunch, County Agent E. C. Thompson of Milwaukee County gave a short talk on calf club work directing it particularly to parents. He urged them to help their boys and girls get started right with a good calf, not a misfit, and thereafter to help only with advice where needed. Let the boy or girl do the work. They will enjoy it and will benefit much more than as if father or a herdsman were to do most of it.

The afternoon program included talks by C. M. Long of the Holstein-Friesian Ass'n of America, D. D. Aitken of Michigan., A. J. Glover of Hoard's Dairyman, J. P. Riordan, Wisconsin, and Dist. Attorney Wengert of Milwaukee Co.; a judging demonstration by Reid Murray of the Wisconsin Live Stock Breeders' Ass'n, a milking contest, judging contest, and a ball game.

Mr. Long spoke on the future of the dairy industry and pointed out that the present small percentage of good sires, the large number of poor cows to be displaced, and the number of dairy cattle condemned for tuberculosis make the future business of the efficient dairyman and breeder secure.

D. D. Aitken wasted no time in commiserating with dairy farmers because of present conditions. He told them that the more efficient dairymen of today were making money and that there was still great room for improvements even on our better dairy farms.

A Correction

HOARD'S DAIRYMAN:—In my report of page 6, July 18th issue, there were two mistakes. One of these is of slight importance and stated that the committee passed a resolution for $2.33 for fluid milk. I find that after the League members decided to leave they apparently thought they had pressed matters too far and changed to simply a "higher price". It is all the same so far as I can see. Of more moment is the fact that the Eastern States representatives did not vote for the higher price. They stood manfully for the right as they saw it and they knew that a higher price at that time was not to be had. I am glad especially to correct this error.

New York. H. H. LYON.

New Pennsylvania Champions

Pennsylvania has five new champion butter producing Holstein cows, according to an announcement made by the Advanced Registry Department of The Holstein-Friesian Association of America.

Bell Farm Bakker is now the state's leading cow for ten months' production as a junior three-year-old with a record of 20,292.8 pounds milk containing 715.61 pounds butterfat, equivalent to 894.5 pounds butter. Her butter record is the third highest in the United States for cows in this class completing strictly official records.

Another cow in this herd, Bell Farm Generous, is the new state leader among senior three-year-olds for ten months' production. Her record is 17,796.7 pounds milk and 654.9 pounds butterfat—equal to 818.6 pounds butter.

For one year's production as a senior three-year-old Loyalsock Korndyke Witra, of the Flock Brewing Company herd, holds the state's highest record with 23,258.3 pounds milk and 859.44 lbs. fat (1,074.3 pounds butter).

The state's new high cow for ten months' production as a full age cow is Charlotte Lyons Korndyke, owned by A. S. Deysher. Her record is 21,323.4 pounds milk and 826.24 lbs. fat, (1,032.8 pounds butter).—Holstein-Friesian Ass'n of America.

PAPEC Throws And Blows Saves One Man

The Biggest Value in Ensilage Cutters

THOUSANDS of farmers agree that the Papec is the biggest value in ensilage cutters—simple, rugged, long-lived. Fills the highest silo without plugging the pipe. Light of draft; costs less to operate. Every part is easy to get at.

The Papec is made in four sizes: R-10; N-13; L-16 and K-19. A gasoline engine, developing 3 h.p. or more, will operate the R-10 size. Any tractor can be used with the medium sizes. For heavy tractors use a K-19 Papec—capacity practically unlimited.

Write for free catalog and U. S. Gov't Bulletin "Making and Feeding of Silage." Every silo owner should read them. Mention size of your silo.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Showing Pigs to Win

(Veva Divan, who wrote this article for the Hoard's Dairyman Juniors, has been for the past two years State Pig Club Champion for Wisconsin. She has a remarkable show ring record and was the owner of the only thousand dollar litter of pigs in Wisconsin last year. She is nineteen years old and a leader of 4—H clubs in Green County, Wisconsin.)

It has been my opportunity to watch exhibitors show their pigs at a great many fairs since I was five years old. I have learned several things which have been a great help to me in showing pigs for myself.

I have seen good pigs placed low in the showing for several different reasons: (1) poorly fitted; (2) crooked feet which could have been made straight by trimming when young; (3) hide and hair in poor condition which could have been remedied by frequent washing with a dip solution and oiling; (4) lack of training. When a pig is not properly trained it is impossible to show him to good advantage. Here are a few rules which have worked well for me.

Feeding. Feed four times a day, not too much at a feed. Let the pigs have plenty of skimmilk in their ration. In the skimmilk mix four parts ground oats, four parts standard middlings, two parts ground corn with a small amount of salt and oil meal added. Mix together and stir in the milk, making a thin slop. About six quarts of this feed daily should be enough for a one-hundred-pound pig. Then the pig should also have the run of alfalfa, red clover, or bluegrass pasture. A few fresh weeds from the garden add greatly to their ration.

Care of the feet and skin. See that the feet are kept straight by

Veva Divan and King's Oneida were great pals. This pig was grand champion at the 1922 Wisconsin State Fair.

trimming them lightly. Wash the pigs often with a solution of warm water and dip to keep them free from lice. This also keeps their hide and hair in a good, soft condition.

Training the pig. The pig should be driven with a light cane or stick. With this you can soon teach him to go where you want him to. In doing this do not be rough, but be firm. Let him understand when you want him to go one way or the other, even though it takes a few good boxes on the side of his head to let him know who is boss. Teach him to pose properly. Take plenty of time in training. You can't teach him everything all at once. Pigs learn fast if you start training them while young and train them a little every evening for at least six weeks before your first showing.

When you drive them into the show ring you can usually show them to so great an advantage that you are bound to be rewarded for your labor.

Do not forget to watch and show your pig all of the time. Never mind the other fellow or how he is showing. Keep your eye on your own pig—and show to win!

"See that the feet are kept straight by trimming them lightly," advises Miss Veva.

The Four-leaf Clover

The dark green, four-leaf clover is the sign of boys' and girls' agricultural club work. This emblem is made use of in a rather striking way by the Juniors enrolled in project work in the state of New York. If you should drive through the country and notice a large, dark green four-leaf clover in the window of a farm house or tacked up on the fence or some other conspicuous place, you would know at once that there is a wide-awake boy or girl on that farm carrying on some home enterprise. This is a splendid way of letting the world know about club work.

Every club member knows that each of the leaves in the four-leaf clover stands for an H in club work. The 4-H clover means head, hands, heart, and health. A further meaning is given to these four H's in the club pledge which states: "I pledge my head to reason, my heart to loyalty, my hands to service, my health to efficiency for the good of my country, my community, and my home."

Close to fifteen thousand boys and girls in New York State last year recognized this 4-H clover as their own, and approximately seven hundred and fifty thousand rural boys and girls, some in every state of the forty-eight, know the emblem and are working for the ideals for which it stands.

The four-leaf clover is universally known as the sign of good luck, but in this case it stands for more. Instead of spelling luck with four letters, the word is spelled with five, and in this manner P-L-U-C-K. By constant, diligent, and hard W-O-R-K it is possible to work the letter "p" away, and we then have left L-U-C-K.

Phil the Philosopher

"We never say can't in club work."

This remark was made by a Wisconsin canning club girl when she met and overcame an obstacle in a chicken canning demonstration. She was putting the parts of chicken into a can. One part was too large. She trimmed and squeezed until it slipped in, and then made the remark quoted above.

No wonder this girl and her sister were state canning club champions in Wisconsin for 1923. If you, too, would be a winner, remember, "We never say can't."

Michigan Club Week

Michigan Club Champions' Week was held at Michigan Agricultural College the week of July 7 to 11, inclusive. One hundred and sixty-five boys and girls and 29 leaders were registered. Only boys and girls who have won county or state championships in their respective projects during the last club year were eligible to attend.

Both a subject matter and a recreational program were carried out. The director of athletics for the college had charge of the recreational program. Swimming in the college pool, ball games, and track events were in order after three o'clock each afternoon. The annual ball game between the club champions and club leaders was won by champions with a score of 16 to 7.

The State Board of Agriculture gave a banquet to club champions. Grace Aldrich of Lenawee County acted as toast mistress. All of the talks at the banquet except a few remarks by Mr. Turner were made by club members.

As a climax to the week a sightseeing trip was made to Lansing and through the State Capitol building.

Michigan. NEVELS PEARSON.

All Hail the Champions!

"Tonight we are rejoicing over the results of the contest. The gold cup is coming back to Whiteside. Sure having a splendid time."

In these words did Donald Williams inform us that the United States had scored another victory, that of winning the international dairy cattle judging contest held July 11 in England. Congratulations, fellows, we're proud as a peacock of you.

Donald Williams, Elwyn Folkers, and Harold Gaulrapp, the boys from Illinois who turned this trick, are all readers of Hoard's Dairyman. Donald is a Hoard's Dairyman Junior and one of whom we are especially proud for among other things he secured 40 subscriptions to Hoard's Dairyman this spring and won a radio set.

The boys were coached by L. O. Wise, farm adviser of Whiteside County, Illinois, and Professor C. S. Rhode, dairy specialist at the University of Illinois. Here is a little something about these boys which may interest you:

Elwyn Folkers is 17 years old, lives eight miles from Sterling where he has attended high school for the past four years, three of which he has been studying agriculture. A year ago the home herd was practically wiped out by tuberculosis. Elwyn and his sister decided that they wanted to have Brown Swiss so each purchased two heifers from the Voegeli herd in southern Wisconsin. Among other accomplishments Elwyn was the champion sow and litter winner in Whiteside County.

Harold Gaulrapp, 20 years old, lives seven miles south of Rock Falls on a 160-acre farm and now has a young herd of four Brown Swiss heifers and one bull. With these animals he captured the following prizes at the county fair last fall: first and fifth prize heifers in club class—first prize young herd in the open class, also a first prize and grand champion junior bull. Harold had the first pure-bred dairy animals on his father's farm. He purchased four heifers from the Voegeli herd also.

Donald Williams, nineteen years old, graduated from Sterling High School a year ago, has been working at home this year and plans to go to college next fall. Donald lives on a 160-acre dairy farm maintaining a herd of about 35 Holstein milk cows. To go to high school meant an eight-mile drive each way every day. Donald entered two Holstein calves in club work. His 12-year-old brother, Russell, also had two calves in club work.

ILLINOIS JUNIORS WIN INTERNATIONAL HONORS

Judging in England against junior teams from other countries, Donald Williams, Elwyn Folkers, and Harold Gaulrapp (left to right) coached by L. O. Wise and C. S. Rhode, won the championship and brought back a gold trophy cup to Whiteside County and the good old U. S. A.

Another Birthday

The Hoard's Dairyman Juniors' Club is nine years old this month. They have all been years of happiness and continued growth. Each year our Juniors have been winners. We are looking forward to the coming year as one of greater achievement; as a year in which Hoard's Dairyman Juniors will meet with greater success; as a year when our club will double its membership. We want your help.

While we are on the subject of birthdays, we would like to call your attention to the fact that we have within our big organization a smaller unit known as the Birthday Club. When is your birthday? Perhaps some other Junior celebrates the same birthday that you do. Please write and tell us the date of your birthday.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

By referring to last week's issu

(Continued on next page)

How to Become a Junior

Any boy or girl under twenty years of ag may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to joi

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Junior Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it no

of Hoard's Dairyman (August 8th) you will get a further discussion on the questions asked below.

How much better is sweet clover pasture than bluegrass? From the experiences of 81 dairy farmers we learn that sweet clover pasture compared to bluegrass saves the dairyman two acres of land for every cow he keeps. This is the same as presenting him with a deed to twice as many acres of land as he has cows. (See article by W. J. Fraser.)

Tell about Mr. Meyers' experience with sweet clover compared to bluegrass pasture. Last year Mr. Meyers pastured his dairy herd of about 40 cows and 10 heifers on 100 acres of bluegrass. This year he has pastured the same herd on 25 acres of sweet clover and reports that his cows produced better during May and June this year on sweet clover alone than they did last year on bluegrass and silage. This is an actual example where 25 acres of sweet clover replaced 100 acres of bluegrass, thereby saving 75 acres of fine tillable land.

Name the essentials of success in raising calves as given in the experiences of F. A. Powell. (1) Proper feeding on a good balanced ration and all the calves desire. (2) Cleanliness—stalls, troughs, calves, feeding pails. (3) Regularity of both feeding and care. (4) Kindness. (5) Alertness by watching for signs of the calf's condition. (See article entitled "Starting a Dairy Under Difficulties".)

When was cow testing association work started in the United States? The first cow testing association began work in January, 1906. Since that time the number has increased year by year until today there are between seven and eight hundred. F. C. McDowell of the United States Department of Agriculture in his article, "More Than a Coincidence", reports that the ten highest states in milk production have fourteen times as many cows on test as the ten states showing lowest production.

What should be considered in building a milk house? A convenient dairy house helps to take the drudgery out of dairying. It need not be expensive but should be conveniently arranged, well lighted, and sanitary. Ample provision should be made for an abundance of pure water, both hot and cold. An inexpensive and efficient outfit for heating water and applying steam for sterilizing milk utensils together with plans for convenient dairy houses are given in C. A. Hutton's article, "Hot Water and Steam at Small Expense".

Junior Letters

Fifty Miles From Railroad

Hoard's Dairyman Juniors:—I have received the necklace, pin, and creed and think them very nice. I intend to put the creed in my room. I sometimes wear the button on my middy and the necklace around my neck when I go horse-back riding as I try often do.

We have 13 dairy cows and 13 heifer calves. My cousin and Dad own their cattle together. I have one little heifer calf and she is doing fine. It is just about three months old.

I am 15 years old and have lived on this farm since I was a baby.

We are fifty miles from a railroad and we get our mail on Mondays, Wednesdays, and Fridays. When we first came here there was no post office on this side of Rock Springs; that is about fifty miles from here and the people out here had to bring it out from town, whenever they were in town. We have no high school here either.

We have just bought a Dodge truck to haul our hay to market. I may learn to drive it; I can drive the Ford. We have had it quite a while.

We also have a tractor. We use it a great deal with our farm work.

We belong to a dairy association that owns two trucks, hires a driver and sends milk to Rock Springs to sell it.

I was very pleased to get that nice letter from you and would be glad if some of the juniors would write to me and tell me all about themselves. I will try and answer every letter I get.

My mother and I together have 17 baby chicks, but we are not having very good luck with them; it is so cold. We also have a few turkeys and I have asked a neighbor woman for two settings of geese eggs.

I wanted to get some rabbits for pets, but dad advised me not to as they are such a nuisance around a place, so I guess I won't get them.

We have a number of heifer calves around here without names. Couldn't you suggest some? Our cows' names are Daisy, Jewel, Princess, Queen, Bell, and I guess that's about all the real names.

I am, as ever, a friend of the Junior Club.
Wyoming. Edna Keeler.

Movies at Club Meeting

Hoard's Dairyman Juniors:—My father has taken Hoard's Dairyman for several years now. We enjoy reading it.

Our club work is coming along pretty well. There are only eight members in our club. We expect a few more to join within the next two months. At one of our meetings this spring the Guernsey Calf Club of Skippack, Pa., was present. The Quaker Oats Co. of Philadelphia showed films of the four leading breeds of dairy cattle at this meeting.

We started our club work last August. Most of the members bought calves from distant places. I got my calf from my father. He sold it to me for $75. I got this money by working on the farm. I made a little money on my rabbits, too. My smaller brother helped me start the fire at our school on Sunday so that it would be warm when the children came to school on Monday.

I feed the grain to the cows, horses, and calves. We give some of our calves skimmilk. We have 15 calves and 15 cows. Half are grades and the other half of them are pure-breds. My brother helps a good deal with this work. My second oldest brother retails the milk. We sell about 300 quarts daily. He uses a truck to retail the milk. We sell butter and chocolate milk, too.

Hoping the other juniors wlil have good luck I will close. I hope some of the juniors will write to me. My address is Red Hill, Pa. Clifford Wood.

Building Bird Bungalows

Hoard's Dairyman Juniors:—I live on an 80-acre farm. We had 12 Holstein cows last fall but we had a sale and sold them. Now we have 13 Guernsey cows and 2 Jerseys. I like the Jerseys best.

We have two big horses. They are all black, and a dog a year old. His name is Rover. I am 11 years old. I go to Shortville school. It is a brick school house. There is a store and a blacksmith shop and a cheese factory close by the school house.

My father is in the Neillsville testing association. My brother and I joined the Neillsville calf club. My brother is 10 years old. I have a sister 8 years old last summer. My brother and I built 5 bird houses; 3 were wren houses and 2 were robin houses. We are going to build more this summer.

I wish some of the juniors would write to me. I will answer. My address is R. 1, Neillsville, Wis. Henry Peterson.

Faye and Her Guernsey Calf

Hoard's Dairyman Juniors:—As you wrote and told me to tell about my club work and how I raised and cared for my calf, I am writing my second letter. My father was at Wooster and was at the office of Myron A. Bachtell, the county agent. He asked daddy if one of his girls didn't want to join the calf club. He said he would ask us. And when he came home he forgot to say anything about it. In a few days we were talking about something and daddy said that reminded him of what Mr. Bachtell said. He asked us if we wanted to join the club and I said I would but my sister, Vera, 12 years old, said she didn't know if she would or not. But later she decided not to.

Then I asked daddy what calf he was going to sell me. Afterward he told me he sold me the best heifer on the place. And I was very proud of her. I fed her once a day and daddy fed her milk twice a day. He fed her 5 lbs. at a time. I did not feed her very many times a day. Just once. I gave her about 3 lbs. of grain a day for awhile and then I fed her about 5 lbs. a day. I would take her out for a romp every day.

One day I was out along the road that goes just in front of our house and a machine came by and scared her. She ran up the bank and got away from me and ran down to the barn. I could hardly catch her. After I caught her I fed her some grain and put her out in the barnyard. About a month before the Wooster fair I brought her in from pasture and began to feed her extra and wash her once a week, and brush and comb her every day. I fed her 6 lbs. a day and gave her all the hay she would eat.

At the fair I thought I would be afraid to lead her into the show ring. But after I was there I wasn't very frightened. I led her out of the ring and the judge judged the calves. I got a second prize of ten dollars. My calf is 16 months old now. Her granddam, Blanche of Lone Oak, made a record of 7895.90 lbs. milk, 442.65 lbs. fat, in 256 days. Her dam, Long Raider's Blanche, made a record of 8766.20 lbs. milk, 446.3 lbs. fat.
Ohio. Faye Michener.

FACTS ABOUT A FAMOUS FAMILY

Thousands of General Motors employes have become home owners through the Savings and Investment Plan.

A family of savers

For each dollar which an employe puts into its Savings and Investment Fund, General Motors contributes 50 cents and pays 6% interest on the amount standing to the employe's credit.

Today over 45% of the eligible employes are participating in this plan; and those who began saving in 1919 will this year receive better than a two-for-one settlement on the amounts they paid in.

A big corporation is just an army of "folks" and the quality of its product is bound to be better when men and women have the opportunity to make steady financial progress.

GENERAL MOTORS

Buick · Cadillac · Chevrolet · Oakland
Oldsmobile · GMC Trucks

General Motors cars, trucks and Delco-Light products may be purchased on the *GMAC* Payment Plan. Insurance service is furnished by General Exchange Corporation.

Prefer a man who had some members of the family that could assist with the milking. House, garden and fire wood furnished. H. E. BOSWELL, Box 66, Burkeville, Va. 5-2

Want a single man as herdsman, with a herd of Registered Holstein cattle. State experience, also wages desired. MARINETTE COUNTY ASYLUM, Peshtigo, Wis.

Wanted at Once—2 middle aged men who can milk 20 head of Jersey cows each. Must be clean. Good home and wages. SWISS DAIRY, Quincy, Fla. 5-3

Wanted November 1—Competent married man to work 180 acre Holstein dairy farm near Dixon, Illinois on shares or salary. Good house and barn. Send references first letter. Address BOX 235, care Hoard's Dairyman. 5-2

Wanted—Middle aged lady to help with the house work. Five in family. Good place and good wages. Must furnish reference. ISAAC STOPPLE, Walworth, Wisconsin. 5-2

Wanted at once, single man, on modern farm, between 20 and 30 years of age, of clean habits, who loves cows and young stock, understands milking machines and separator and is good feeder and cow man. Electric lights and power. James equipment throughout. Good wages. FERNWOOD FARMS, Walter E. Jenney, Mgr., Pewaukee, Wis.

Wanted at Once—A single man to work in dairy barn. Must be a first class dry hand milker, a worker and have good habits. A real job for the right fellow, and the best living conditions. POPLAR DAIRY FARM, Box 371, Uniontown, Pa. 5-2

Wanted—White man and wife both good milkers, to handle small herd and milk 12 cows. Man must understand cultivation cow peas and oats for winter grazing. Wife to care for milk and assist in general house work. State experience and wages in first letter. C. M. RUSSELL, Handsboro, Miss.

POSITION WANTED

Superintendent, 40, college training, 15 years successful, practical experience farm and estate management, desires position. A-1 reference. Address BOX 225, care Hoard's Dairyman. 3-3

Manager, college graduate, single, experience in every phase of grain, stock, dairy farming, gardening, marketing, wants to change. Specialty breeding and development of dairy cattle. Only large, modern proposition considered. Salary or share basis. Please write BOX 224, care Hoard's Dairyman. 3-3

Couple—Americans, Scotch-Irish, Protestants, Man, thorough farm and estate experience, capable taking charge. Wife, excellent cook, laundress or houseworker. Age 35. Two boys, 5 and 6. Best of references. Address BOX 231, care Hoard's Dairyman. 4-2

Position Wanted—As herdsman, by single, middle aged man, on pure-bred modern dairy. A. R. O. Veterinary ailments. State wages and conditions. Address BOX 238, care Hoard's Dairyman.

POSITION WANTED

Will be open September 1st for superintendency dairy farm or will consider renting on shares. Married. Life experience. Address BOX 237, care Hoard's Dairyman.

Position wanted by experienced dairyman, married. I have plenty of help. Capable of taking charge of an up-to-date dairy. BOX 13, Burkeville, Va. 5-2

Married man wants job as foreman on dairy farm. Understand milking machine, tractor, and handling help. Lifetime experience. Best references. C. L. COBURN, Carleton Hotel, Beloit, Wis.

Position Wanted—As farm manager or herdsman. Life time experience in all branches of farming and raising Holsteins. Particularly experienced in official testing of Holsteins, have made good A. R. O. records. Keep accounts and records. Judge of show cattle. Have handled dispersal sales. Best of references. JOHN BOHRNANN, 923 Milwaukee Ave., Racine, Wisconsin.

Wanted—Work and home on good, small dairy, truck or general farm. Would rent an equipped farm. Minnesota, Wisconsin or Canada preferred. HORACE GODFREY, Fayette, Mo.

South Dakota Butter Champions

South Dakota has six new champion butter producing Holstein cows, according to the Advanced Registry Department of The Holstein-Friesian Association of America.

Pansy Lockhart Genesta is now the state's leading cow for ten months production as a junior four-year-old with a record of 22,770.1 pounds milk containing 729.18 pounds butterfat equivalent to 911.4 pounds butter. She is owned by F. W. Barth.

For ten months' production as junior two-year-old Beauty Mercedes Colantha Nig, of the same herd, holds the state's highest record with 16,844.3 pounds milk and 543.41 pounds butterfat—equal to 679.2 pounds butter.

The state's new high cow for one year's production as a junior four-year-old is Yankton Gerda Pontiac Beryl, owned by the State Hospital. Her record is 24,309 pounds milk and 704.3 lbs. fat (880.4 pounds butter).

A record of 18,931.6 pounds milk and 701.36 lbs. fat (876.7 pounds butter) in ten months makes Redfield Segis Johanna of the State School or Home for Feeble-Minded herd the state's new leader among senior two-year-old cows.

Ormsby Korndyke Johanna, owned by F. E. Johnson, is now the state's highest record cow for production in ten months as a full age cow. Her record is 21,629.7 pounds milk 649 lbs. fat and (811.4 pounds butter).

Another cow in the Johnson herd, Clothilde Vernon Rose, now holds the highest record in the state for ten months' production among senior three-year-olds. Her record is 20,585 pounds milk and 641.6 lbs. fat (802 pounds butter).—Holstein-Friesian Ass'n of America.

BULL CALVES

Desirable sons of Sir Charlevoo Ormsby Finderne whose dam produced 35,339.5 lbs. of milk and 1,278.56 lbs. of butter in 365 days and out of short and long time record cows.

Friendly Talks For Farm Folks

Last year on Labor Day Hal Purdy and his family decided that they would take a much deserved and needed vacation and get onto the road with the rest of the world and have a good time. So forth they started bright and early, even if the haying wasn't quite finished and several little things about the farm needed attention. They hadn't been driving more than an hour when the left hind wheel gave an awful bang which announced to all that a blow-out was first on the program. After Hal and the oldest boy had labored manfully in the scorching sun for the better part of two hours to get the thing patched up—Hal hadn't seen his way clear to getting a new spare as yet—they all piled in again and started out on the joyous vacation day. By that time it was pretty near noon and the younger kids were making motions toward the lunch basket. Hal promised that at the first shady place with a spring they would stop and eat, so he and Mrs. Hal gave their undivided attention to the view for a few more minutes, ignoring the quarreling and so on proceeding merrily on the back seat. Hal was pretty tired and cranky after the tire episode and Mrs. Hal was too warm and happened to remember that she had forgotten a pie in the oven in the rush of getting started, which didn't cheer matters up much. The oldest boy was reading a comic strip on the back seat in the midst of the younger children, and was grouching to himself because he hadn't stayed home and gone swimming with some of the neighboring boys. Pretty soon an ideal spot for lunch hove into sight and Hal stopped the machine and all hands prepared to descend and give the inner man nourishment, Mrs. Hal being a fine cook. But when they went to get the capacious lunch basket on the floor in front of the back seat, it simply wasn't there. "Where's that lunch basket?" demanded Hal and Mrs. Hal in unison as they hunted around for it. Where in blazes has the thing gone to, I should like to know!" "Why, pa," answered Mary, the five-year-old girl innocently, "the baby threw it out a long ways back but we didn't want to make you stop 'cause you was cross about the tire." About three o'clock the Purdys arrived home, not rested and refreshed as those are supposed to be who devote themselves to pleasure on a laborless Labor Day, but most decidedly hot and tired and hungry. "Serves me right for leaving the haying," said Hal to himself after all hands had filled up on burned pie and stale bread. "What business has a farmer got to take a vacation anyhow?"

⚜

Perkins Crumb allows that if the fly season don't get over with pretty soon, he'll have the hired man spray his bald head along with the cows night and morning.

⚜

In the good old days before the era of gasoline engines, they used to change the horses every hour when they furnished the power for threshing and the like. But nowdays, the farmer does the treading without any change whatever, while his contemporaries in the city get every holiday and Saturday afternoon off, not to speak of an eight-hour day. But the silver lining is that the city man has to do something so he spends his money and has nothing left.

⚜

Alton Springer has confided to his mother that he's got to quit going with that new clerk in the five and ten as her strong perfumery gives him a headache. The double distilled scents are sort of strong after being used to the more subtle smell of clover hay and daisy and curing hay made after the Lord's recipe.

⚜

To illustrate the power of habit, a summer boarder from the city, who originally hailed from the country herself, just can't get used to the taste of fresh milk because she has become accustomed to the different taste of pasteurized milk. She says she can't enjoy milk again until she goes home in the fall.

⚜

It seems very unlikely at this writing that Paul Holcomb will get his haying done this year until December, as he has a perfectly legitimate excuse in not beginning as usual toward the later part of August, inasmuch as everyone knows the season is just a month late this year. Paul manages most years to get all through by the first of October with good luck. This is a great life if a fellow vows not to worry.

New York. HELEN S. K. WILLCOX.

Embury SUPREME OIL LANTERNS

We think they are the best lanterns on earth. Next time you buy a lantern, compare every detail of the Embury with any other. Look for improvements like the solid dome, rain- and dirt-proof; the big brass oil filler; the short globe; the extra strong construction throughout.

No. 160 is a winner—improved burner gives 20% more light and burns 35 hours; dust-, dirt-, wind- and rain-proof; $1.50, except in the far west.

There's an Embury for every purpose

ORDER FROM YOUR DEALER

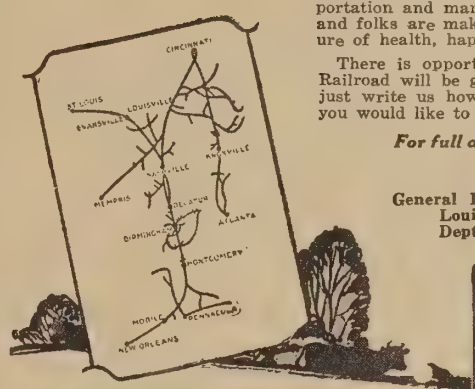
Low Factory Price—Free Trial Offer

Tremendous value. Thousands of satisfied users. Write now for details and free trial offer on this amazing engine.

Edwards Motor Co., 237 Main St., Springfield, Ohio

Are You Making A Profit?

Are you making money, or just "getting by?"



Why not establish yourself and family in a section of the country that is more favorable to money-making—where you can raise all of the foodstuff and feedstuff that you need, right on your own land, and not have to pay someone else a high price for it; where fine grazing lands are cheap, and where forage crops grow at all seasons of the year; where the climate is easier on those whose work is out-of-doors; where labor is plentiful and taxes are lower—*and the demand for dairy products far exceeds the supply?*

In the vast agricultural territory traversed by the L. & N. Railroad, through the heart of the South, are many communities where dairying and stock raising are highly developed and prosperous industries; where the transportation and marketing problems have been worked out and folks are making money and enjoying a great measure of health, happiness and contentment.

There is opportunity here for you; and the L. & N. Railroad will be glad to tell you all about it if you will just write us how you are situated at present and how you would like to be situated.

POULTRY On The DAIRY FARM

The Hen on Trial

Careful Checking Proves Her Case

HOARD'S DAIRYMAN:—If a thief robbed a hen roost, entered a home or in any other manner took property without giving adequate value in return, he would, if detected, be tried, and if evidence of his guilt could be proven, he would be punished.

On nearly every farm where poultry is kept there are thieves constantly reducing the profit from the flock, that in many cases go undetected year after year. These thieves, known during war-time as the "slacker hen", are the birds that eat good, high priced grain, representing money and fail to produce enough eggs to pay for the cost of the feed. They are taking valuable property, which represents money, and do not give value in return, therefore they are thieves and should be tried.

Plenty of evidence is there and needs only a little observation on the part of the owner to prove the case against the unproductive hen. All hens that lay well have certain characteristics and no hen that does not lay well can possibly have these qualities.

Several methods are in vogue for determining these qualities and thus detecting the unprofitable birds in the flock. Nearly all of these methods give satisfactory results and have been practical for years, yet on the general farm culling for egg production is not generally practiced and heavy losses that might otherwise be checked are suffered in consequence.

The following method is one that has been practiced by the writer for years and can easily be learned by even the inexperienced poultry keeper. No claim is made for any one best method, but the method given has produced very satisfactory results. The method follows:

In Order to Lay Well a bird must have a sound body. As a first consideration a bird must be vigorous and healthy if it is to be able to lay well. Vigor and health are shown by a bright, clear eye, a well set body, a comparatively active disposition and a good circulation.

Further, the bird must be free from physical defects such as crooked beak, excessively long toe nails, eyelids that overhang, scaly leg, or anything else that would keep the bird from seeing or getting an abundance of food.

Loss of Fat Due to Laying

Color of Pigmentation Changes. (These should be observed by daylight.)

A laying fowl uses up the surplus fat in the body, especially it removes the fat from the skin. In yellow skinned breeds this loss of fat can readily be seen by the loss of the yellow color. The different parts of the body tend to become quite white, according to the amount of fat stored in the body and the amount of circulation of blood through that part. The changes occur in the following order:

The Vent changes very quickly with egg production so that a white or pink vent on a yellow skinned bird generally means that the bird is laying, while a yellow vent means a bird is not laying. It should be recognized that all yellow color changes are dependent on the feed, the coarseness of the skin, and size of bird. A heavy bird fed on an abundance of green feed or other material that will color the fat deep yellow will not bleach out nearly as quickly as a smaller or paler colored bird.

The Eyering, that is, the inner edges or the eyelids, bleach out a trifle slower than the vent. The earlobes on Leghorns and Anconas bleach out a little slower than the eyering, so that a bleached earlobe means a little longer or greater production than a bleached vent or eyelid.

The Color Goes Out of the Beak beginning at the base and gradually disappears until it finally leaves the front part of the upper beak. The lower beak bleaches faster than the upper but may be used where the upper is obscured by horn or black. On the average colored, yellow skinned bird, a bleached beak means heavy production for at least the past four to six weeks.

The Shanks are the slowest to bleach out and hence indicate a much longer period of production than the other parts. The yellow goes out from the scales on the front of the shanks first. The scales on the heel of the shank are the last to bleach out and may generally be used as an index as to the natural depth of yellow color of the bird. A bleached out shank usually indicates fairly heavy production for at least 15 to 20 weeks.

Body Changes Due to Laying

A Laying Hen has a large, moist vent showing a dilated condition and looseness as compared with the hard, puckered vent of a non-laying hen.

The whole abdomen is dilated as well as the vent so that the pelvic arches are widespread and the keel is forced down, away from the pelvic arches so as to give large capacity. The more eggs a bird is going to lay the following week the greater will be the size of the abdomen. The actual size of the abdomen is, of course, influenced by the size of eggs laid and by the size of the bird.

Heavy Production is shown by the quality of the skin and the thickness and stiffness of the pelvic arches. Fat goes out from the skin and body with production so that the heavy producers have a soft, velvety skin that is not underlaid by layers of hard fat. The abdomen in particular is soft and pliable. The sternal processes are very prominent and are generally bent outward. The thicker and blunter the pelvic arches, the greater the amount of hard fat in the abdomen and the less the production or the longer time since production.

One of the Finer Indications, but yet one of the most valuable in picking the high layer, is the fineness of the head and closeness and dryness of feathering. The head of a high layer is fine. The wattles and earlobes fit close to the beak and are not loose and flabby. The face is clean-cut. The eye is full, round, and prominent, especially when seen from the front. The high layer is trimmer, that is, the feathers lie closer to the body and after heavy production the oil does not keep the plumage relatively as sleek and glossy but the plumage becomes worn and threadbare.

Changes in Secondary Sexual Characters

The comb, wattles, and earlobes enlarge or contract, depending on the ovary. If the comb, wattles, and earlobes are large, full and smooth, or hard and waxy, the bird is laying heavily. If the comb is limp the bird is only laying slightly, but it is not laying at all when the comb is dried down, especially at molting time. If the comb is warm it is an indication that the bird is coming back into production.

Molting

When a bird stops laying in the summer she usually starts molting. The later a hen lays in the summer or the longer the period over which she lays, the greater will be her production so that the high producer is the late layer and hence the late molter. The length of time that a hen has been molting or has stopped laying can be determined by the molting of the primary feathers. It takes about six weeks to completely renew the primary feathers next to the axial feathers and an additional two weeks for each subsequent primary to be renewed.

Temperament and Activity

A good layer is more active and nervous and yet more easily handled than a poor layer. A high layer shows more friendliness and yet elusiveness than a poor bird. A low producer is shy and stays on the edge of the flock and will squawk when caught.

While the characters discussed have dealt with the current year's production it should be borne in mind that a high producer one year is, generally speaking, a high producer in all other years.

Egg prices are low and grain prices are relatively high. No man can afford to keep birds in his flock that does not produce enough to more than pay their feed costs.

July, August, and September are the easiest months in which to practice the method given. A little study and practice with this method will do much to increase the profit from the poultry flock.

Rhode Island. S. D. HOLLIS.

Book For Poultry Raisers

Poultry raisers will find "Productive Poultry Husbandry", by H. R. Lewis, a valuable and interesting addition to the book shelf. It presents the subject thoroughly but in such readable form that one enjoys it.

To the farm poultryman it clearly pictures methods which would enable the keeping of more birds with no more labor and at much increased profit. It gives the practices found most efficient by successful poultry raisers and by the various state and national experiment stations. By making free use of its good index, information regarding almost any question on poultry raising and disease control may be located.

"Productive Poultry Husbandry", now in its fourth and enlarged edition, is one of the series of Lippincott's Farm Manuals. It will be sent postpaid upon receipt of $2.50, either by the publishers or by the Hoard's Dairyman Book Department.

Tom Tarheel says that he didn't know chickens drank so much water until he began to put fresh water in clean containers for them each day.

The Certified Bottle Cap

Used by the milk distributor mindful of the service rendered to his patrons.

A few advantages of the Certified Cap:

1. The Red Flap of tough rope fibre can be easily grasped—no fork or icepick required.
2. The Red Flap won't pull off—the wire staple holds it securely.
3. The Red Flap can be easily seen—it is distinctive.

Remember the name—CERTIFIED—and look for the Red Flap. If your jobber cannot supply you, write direct.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

The "Crazy" Cow

It is important to be able correctly to differentiate between the forms of so-called "craziness" in cows. In one form the animal suddenly becomes "raised" and runs amuck when tremendously excited. That sometimes occurs when a cow or steer is being driven on a city street to market or has been unduly excited when in the market or when being led home from the railroad. Often a steer has become "raised" on its way to the stockyards in Chicago and has done considerable damage before being shot. A range steer is most liable to become so affected. When it happens the animal would be likely to recover in a short time if placed in a secluded yard or box stall, kept perfectly quiet, and cold applications were put upon the head. A full dose of chloral hydrate, dissolved in water and injected into the rectum, would also tend to quiet the animal until rush of blood to the head subsided. Similar attacks may be caused by exposure to the hot sun when cattle run on pasture, but are comparatively rare.

A form of the disease that usually is a great puzzle to the owner and sometimes to the veterinarian is that seen affecting a pregnant cow some time before calving. She suddenly goes "crazy" and shows symptoms that often have been mistaken for those of rabies. Affected cows have even been shot, as rabies was thought to be present. For that reason and the possibility of making an expensive error in diagnosis, a veterinarian always should be employed to examine a cow that becomes frantic and apparently "mad". In some attacks of lead poisoning the cow dashes about and falls now and then. Similar symptoms sometimes appear in forage poisoning. These facts emphasize the importance of a correct diagnosis by an expert. In all cases the animal should be penned and watched until the exact nature of the disease can be determined.

In craziness associated with the pregnant condition and technically termed "puerperal mania", the animal becomes violently excited and unmanageable. She runs about pawing the ground, bellowing as if in heat, attacks imaginary foes, threatens to attack animals and man, but does not lay hold with her teeth.

The eyes are staring and excited, as in all cases where the brain is affected, and the white of the eyes may turn red. The membranes of the eyes always are more or less injected and reddened. Feces and urine are expelled involuntarily or spasmodically and muscular twitching may be seen. If a dog comes near, the cow chases it at once and may so attack other animals. The attack does not prove fatal.

When a cow affected in the way described, but is not very violent, is placed in a secluded box stall or pen, the windows darkened and perfect quietude maintained she may recover in a few hours. The violently affected animal is best confined in a well fenced yard or paddock where she cannot get at the other stock and will not be likely to injure herself. Here she should be disturbed as little as possible, but if it proves possible the rectal injection of chloral hydrate may be tried or a large dose of bromide of potash administered. The medicinal treatment is not absolutely necessary. The cow will in time recover, certainly when calving has occurred.

Cowpox

About a year ago my cows go pimples or small boils on their teats which would get very sore and finally get kind of white and scab off. This seemed to spread from one to another even with the frequent use of disinfectants. Now these boils are as large as a pea, covering the teat the entire length. Can you suggest a remedy for this ailment?

Alda, Nebr. H. B.

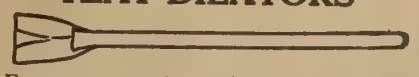
The cows are evidently affected with cowpox which is readily carried from cow to cow by the milker's hands. The most important measure, when a cow is attacked, is to keep her isolated and have her milked by one who does not handle the other cows. It is also necessary to keep the sores from being infected by filth germs. Twice daily, for 5 minutes or more, immerse the teats in hot water containing all the boric acid it will dissolve, or in a hot 1 to 1000 solution of chinosol. Then dry gently and paint the sores with a saturated solution of permanganate of potash.

As soon as the sores apparently are healing cover them each evening with a soft paste of subnitrate of bismuth and castor oil. If any sore is slow in healing, apply strong iodine ointment once or twice daily. Milk with clean, dry hands. If a milking tube must be used to draw off the milk, boil it for 15 minutes, and apply carbolized vaseline each time before inserting it in the teat. Cleanse, disinfect, and whitewash the cow stable, including the floors and gutters.

Depraved Appetite

Please tell me why two out of ten of my cows eat rotten wood and board and just smell around the corral for it.

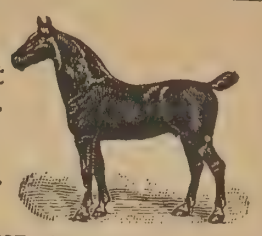
Colorado. R. N. S.



Indigestion commonly is the cause of a craving for wood, bark, bones, rags, and other foreign substances. The ration may lack some needed element. Allow free access to salt and feed a generous ration of ground grain, bran, and oil meal, in addition to good pasture. If that does not suffice give each cow a tablespoonful each of bicarbonate of soda and powdered wood charcoal twice daily in her feed. Increase the dose of soda, if the symptoms do not quickly subside.

Obstructed Teat

I have a promising heifer that had a calf about three weeks ago. One teat is about closed. What can I do for it, please?



E. Dubuque, Ill. W. W.

A teat plug or dilator that has been sterilized by boiling should be used to enlarge the opening in the teat. If that does not suffice it will be necessary to slit down through the stricture in four different directions with a teat bistoury. It would be advisable to have a veterinarian operate.

MEDICATED WAX TEAT DILATORS

For sore teats, obstructions, Spiders, Hard Milkers, etc. 25c per doz., or 5 doz. for $1.00, postpaid. MOORE BROS., Dept. H, Albany, N. Y.

Edgerstoune's Luxury Bond
A Promising Young Bull For Sale

Edgerstoune's Luxury Bond
Born Aug. 10, 1923
His sire, Sandhill Premium Bond Imp., was a first prize winner in Scotland as well as a National Dairy Show winner in this country. His dam, Nether Craig Luxury, 2nd at the 1923 National Dairy Show, has a record of 13,742 lbs. milk 594.36 lbs. fat. This youngster is a promising prospect as a show bull and as a herd sire. Write today for price and pedigree.
EDGERSTOUNE FARM, Geo. A. Hill, Mgr., Princeton, N. J.

Making Soy Bean Hay

(Continued from page 101)

success in curing. I doubted if soy bean hay could be cured in good fashion in a wet fall as we had in 1923 by cutting with a binder and shocking, but after looking at Mr. O'Keefe's fine hay I am convinced that this method is possible and where the plants reach a fair height, is a desirable method because the coarse, woody part isn't all saved and a cleaner hay is saved. At University Farm where we tried curing after cutting and shocking, some of the bundles molded in the centre, but we had an unusual rainy spell very unlike the average September.

Ways of Handling Crop After Cut

There are probably as many ways of handling soy bean hay as with any other hay—but it is the aim of every farmer to so cure his hay that it is most palatable and contains the most feeding matter. Our investigators find that hay cured in cock has a higher feeding value than hay cured in swath or windrow, especially if it has been subjected to a rain. On large acreages, especially in short labor times, the cocking of hay is about impossible but where help is available I believe that the extra time required is a good investment. J. W. R. Smith, veteran soy bean grower of Ohio, has for years cured acres of soys for hay and his method consists of cutting one day, and after only a few hours, probably soon after the dew is off the next morning, uses a side delivery rake and then uses it as often as necessary until the hay is cured. Mr. Smith leaves the hay in the windrows until ready to haul into the hay mow and then bunching only previous to hauling without shocking. Mr. Smith's experience leads him to believe that there is no wasted or spilled beans if they are cut just before the leaves begin to fall if the beans are fully grown but still green, but believes that the side delivery rake essential when cutting for hay or seed, in that the field can be turned over so very easily. However, on our smaller Wisconsin farms with limited areas of soy beans for hay, possibly the cocking would be more desirable.

Professor Delwiche of Wisconsin is a strong advocate of cocking into small cocks soon after cutting. On lighter soils where drainage is excellent this immediate cocking will give excellent curing, but for larger acreages and heavier soils, a cutting of the hay one day, then raking early the next morning before leaves become brittle, then cocking, is probably the practice most widely followed. Because of the character of stubble being loose, oftentimes it is wise to make cocks direct from swath instead of raking or using side delivery. Available labor will determine the method. It is well to know that soy hay cocked rather green before leaves have become brittle, rolled up or fallen off, will shed water better than when cocked later. After putting into a small cock, narrow and high, rather than wide and low, very little attention need be given. In damp weather a better grade of hay is realized from just leaving the cocks alone, rather than spreading them out too often. Some farmers make small cocks, then double them up after a few days. Others find that better results come from leaving in swath for probably a day, then putting directly into medium sized cocks and leaving them until day of hauling into barn, when a few hours previous to hauling every cock is turned over so as to drive off moisture on lower side of cock.

When old fashioned reaper is used—the bunches can cure as they have fallen. There is not so much in a place to mold, and there is just about enough to make a small forkful. In that it is lying loose, air will circulate some and in a reasonable fall, good curing is assured. If crop attains a height where a binder can be used, the soys could be handled as with a reaper, using no twine. However, after more trials with binder and twine, maybe this method will be more widely practiced, because of ease in handling the bundles.

Then there are a few men besides McMillan who have been brown curing their soy bean hay. Take Fred Sack of Wood County; last season he waited until early September to cut his 23 acres of soys. When he finally got them cut, it rained and rained and he became so discouraged he put the full amount into a large, open shed. The pile heated—steam came from all directions, mushrooms covered the whole surface two weeks after putting into stack. To his surprise, in midwinter when he investigated this pile to see if he could use it for feed or fertilizer, after cutting through a few inches of outside, worthless rotten material, he came into the finest of brown cured hay one could ask for. Sure, there was some waste, but the way cattle dig into almost unfeedable hay is a wonder. Word came from Mr. Thomas of Indiana (I have also heard farmers of this state, too) that it is surprising how cattle will consume this brown cured hay. They will even eat stalks cured this brown method that they wouldn't eat if cured the regular way. But, then, I'm not advising farmers to resort to brown curing of soy bean hay. It is only the last resort and, personally, I would try it only in an out-of-the-way building or stack.

JERSEYS

CEDAR CREST FARMS

BROWN SWISS

ANNOUNCEMENT

Kinnelon Farms, owned jointly by Warren & Morris Kinney and for thirty-four years the home of pure-bred Brown Swiss cattle, announces herewith a reorganization, change of name, ownership and location.

The entire herd will be moved this month, August, to Lees' Hill Farm, at New Vernon, N. J., with Post Office at Morristown, and will be known henceforth as the Lees' Hill Farm herd. Mr. and Mrs. Warren Kinney are the new owners, Morris Kinney having recently sold out his interest to them.

The management will be the same as heretofore and a constructive breeding plan for the improvement of type and production will be carried on. Brown Swiss breeders are urged to associate the name "Lees' Hill" with "Kinnelon". It means the same blood, backed by the same high records, and under the same intelligent management.

Herd fully accredited, Certificate number 65301

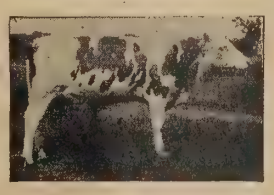
Queque Korndyke Sadie Vale



Line bred Sadie Vale bulls for sale.
HOME FARM HERD — *Accredited. Estab. 1881.*
W. B. BARNEY & SONS - - - CHAPIN, IOWA

Bargains in Registered HOLSTEIN BULLS--- all ages

Ormsby breeding, large 7-day and year records. True type conformation. Tell us the kind of a bull you want.
Hargrove & Arnold, Norwalk, Ia.

Richly Bred Holstein Bull Calves

out of A. R. dams and sired by our two richly bred herd sires—King Piebe Ormsby Mercedes, a 35-lb. son of Sir Korndyke Bess and every dam in pedigree over 22 lbs. and King Pietertje Mercedes Ormsby, a son of Sir Pietertje Ormsby Mercedes and out of a 19-lb. senior two-year-old dam.
Herd tuberculin tested. Write for information or visit herd.
P. FROST SPAULDING FARM CO
C. L. Spaulding, Mgr. Warren, Minn.

This Handsome Bull For Sale -- $400

Six nearest dams average 1007 lbs. butter in a year.
Sire, SIR WALKER SEGIS HOMESTEAD, a show bull (31 A. R. O. daughters), a "PIEBE" son from a 1230-lb. (former world champion) daughter of "COUNT"
Dam, MARIE PONTIAC PRIDE, 745 lbs. butter in 365 days as a junior two-year-old, while her dam made 1016 lbs. butter as a four-year-old. A TOP-NOTCH INDIVIDUAL WITH A SPLENDID PEDIGREE. Born August 26, 1923.
Send for pedigree and photo.
A. J. LASHBROOK - Northfield, Minnesota

SERVICEABLE BULL — From A. R. O. Dam

Born April 18, 1923. Sired by Sir Walker Segis Homestead, a son of "PIEBE" from a 1230 lb. former world record daughter of "COUNT." Dam—a 22.38 lb. 2-year-old, 615 butter, 16000 lb. milk in 305 days and now making 26 lb. in 7 da. as 3-year-old. One of 29 A. R. O. daughters of King Segis Pontiac Fayne Star, the best proven son of "COUNT". Price $350.00. Write for photo and pedigree.
CARLETON COLLEGE FARMS, NORTHFIELD, MINNESOTA
Federal Accredited Herd.

Oatman Farm Holstein Herd

Improve Quality and Type and increase production by buying a herd sire from Oatman Farm. Entire herd on yearly test. Never a T. B. reactor nor abortion. World's record and Grand Champion breeding. Average production per cow per year 17,000 lbs. milk—726 lbs. butter. Write for bull sale list.
O. A. JENS, Mgr. DUNDEE, ILL.

BUFFALO CREEK FARM HOLSTEINS
Three bull calves for sale from tested dams and an Ormsby bred bull. Born in February. Also a son of a 38-lb. cow with a year record of 970 lbs. born in June. Write for prices and pedigrees.
Herd under federal supervision.
H. L. BINGHAM, Arlington Heights, Ill.

36-lb. Breeding

back of this young Holstein bull and he is yours at a low price. Age 10 mos., white. Younger calves offered also.
ORCHARD CREST FARMS, R. D. 3, Schoharie, N. Y.

Grahamholm Herd

We are using Dutchland Creamelle Colantha Lad and Duke Pietertje Korndyke Ormsby on our select herd of over 100 females. We have a few serviceable sons and grandsons of "Dutch" and some of "Duke" for sale; also some calves that will soon be ready for service. GRAHAMHOLM FARM,
D. G. Tweatyman, Manager Rochester, Minnesota

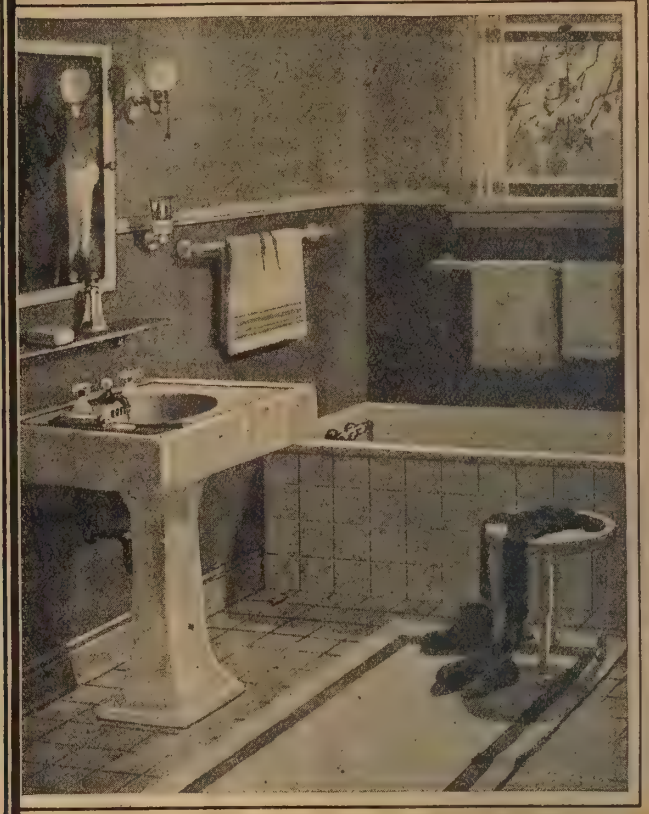
30 Extra Fancy Grade HOLSTEIN COWS

Due to freshen September and October. All young and free from blemishes. Tuberculin tested by Federal Veterinarian and eligible to be placed in an Accredited Herd. These cows are very heavy producers, making from 12,000 to 20,000 lbs. each. Will be sold cheap, quality considered. If in market write
RIVER MEADOW FARMS, Portlandville, N. Y.

A 1000-lb. Son of Prince Aaggie of Berylwood

BERYLWOOD PRINCE JOHANNA SEGIS was born February 23, 1923. He is an excellent individual that we have used in our own herd.
His dam a 1050-lb. 4-year-old is from a year record dam.
His sire, Prince Aaggie of Berylwood is a grand champion bull, all of whose 7 nearest dams have records above 1000 lbs. butter in a year.
He is guaranteed to be right. Write today for price, pedigree, etc.
BERYLWOOD STOCK FARM, J. W. Snodgrass, Mgr., Hueneme, Calif.

A YEARLY RECORD HERD



The Clover Lawn Farm Holsteins. 150 head. 60 cows with yearly records. 20 young bulls, one month to 2 years old for sale, sired by King Longfield Pearl Vale, whose dam made 1225 lbs. of butter 26,050 lbs. milk a year. Can spare a few choice young cows. State exactly what you want.
JOHN H. PULS - - ALLENTON, WIS.

CRANE AUTOMATIC WATER SYSTEMS

CRANE AUTOMATIC WATER SYSTEMS CAN BE HAD IN CAPACITIES RANGING FROM 200 GALLONS UP TO 6,000 GALLONS PER HOUR.

FOR THE HOUSE, TWO TYPES FOR THE ORDINARY AND DEEP WELL ELECTRIC OR GASOLINE POWER. A THIRD TYPE FOR LARGE USERS.

Aren't these comforts and advantages in your home and on your farm, worth a few cents daily?

Anything that adds permanent value to your farm is an investment, not an expense. Especially when it makes your place more productive and easier to manage, and at the same time provides healthier and happier living conditions for your family.

A Crane Automatic Water System pays for itself many times over in the double-duty service and convenience that it gives.

Saves you more than you pay

It adds more to the value of your property than it costs. It brings your farming methods up-to-date. It banishes old-time drudgery on wash-days and plants solid comfort in your kitchen and bathroom every day. Yet its cost to operate is only a few cents daily for the average home.

Automatic water systems for all needs

There are Crane systems designed to meet the needs of the average farm or suburban home as well as the large country place or summer hotel. The outfit illustrated pumps 200 gallons per hour; other systems supply up to 6,000 gallons an hour. Both electric and gasoline motor power.

Water may be pumped from any open or driven well, cistern, spring or lake. Motors and pumps are accessible, smooth-running, efficient. Valves are interchangeable. All moving parts flood-lubricated. Built, inspected and tested to give years of never-failing service, the Crane nameplate on any unit you buy guarantees its dependability and lasting satisfaction.

Call on the plumbing contractor or hardware dealer who handles Crane materials. Let him help you plan a water system whose low first cost will surprise you.

Start now to enjoy these advantages

Begin by equipping the kitchen and fitting up a bathroom. Add other fixtures as conditions permit. Decide now that *your* family shall enjoy city comforts and conveniences. Mail the coupon below for our new Booklet H.D. 1 on farm water systems.

CRANE

GENERAL OFFICES: CRANE BUILDING, 836 S. MICHIGAN AVE., CHICAGO

Wherever you live, there is a plumbing contractor or hardware dealer near you who handles Crane products. He has the Crane water system that fits your needs or he can immediately secure it from the nearest of 122 Crane branches and offices in the United States. Should you have any difficulty in securing the right water system, write to us.

EVER FAILING OR NEVER FAILING PASTURE

Part 8.

Sweet Clover Saves The Cow's Energy

WILBER J. FRASER, University of Illinois

The dairy cow is the hardest worked animal on the farm.

On short pasture the cow must spend much of her time foraging.

On abundant pasture heavy milking cows can keep filled up by grazing only a few minutes at a time—2 or 3 hours a day.

Sweet clover pasture will save land; save labor in the busy season; save the cow's energy for use in the manufacture of milk.

THE conditions under which a good dairy cow produces a large yield of milk are: an abundant supply of suitable feed to meet her needs, and a chance to lie down in peace and comfort so that her milk factory can operate efficiently in its work of producing milk.

It is apparent to all that it is more healthful and invigorating to the cow to gather her own feed in an open pasture than to stand in a stall all summer. Sweet clover lengthens the pasture period to the utmost and gives her at least six months of abundant feed in the open, while the failing bluegrass compels her to get most of her feed in the manger if she gets feed at all.

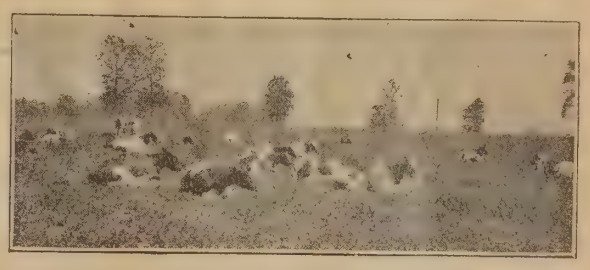
MINIMUM "PASTURE WORK" ON JOHN R. SMITH'S FARM, CHAMPAIGN COUNTY, ILLINOIS

When on sweet clover pasture like this, cows can gobble up all they can hold in fifteen minutes, and then lie down for three hours in peace and comfort, chew their cuds, and make milk.

Foraging or Making Milk?

The cow is equipped by nature with a seven bushel bread basket—or rumen—in which she gathers her feed; then she lies down to "eat" and digest this material and manufacture it into milk. She must be at apparent rest for the greatest efficiency in this work of handling her feed. She can fill her bread basket in a very short time if plenty of food is at hand, but she needs to *concentrate for a twenty-hour day upon her factory work.* It can not be done so well while she is walking the range. The kind or rather quantity of pasture has a direct bearing on these two operations. The ever abundant sweet clover enables the cow to fill her bread basket in less than an hour, but the scanty bluegrass keeps her foraging night and day to get enough raw material to run her factory. This was clearly seen by the writer in some field observations and is familiar and reasonable to us all when we watch the cows in the pasture and consider which operation is receiving their principal time and energy—foraging or factory work.

Wasting the Cow's Energy



On September 13 the writer visited a fine dairy herd of high producing cows on sweet clover pasture in Central Illinois, and 15 of the 17 cows were lying down. The two that were standing were not eating, but simply chewing their cuds. Two days later, in a 50-mile auto trip through Central Illinois, 61 herds were observed on bluegrass and grain stubble pasture, none of which was sweet clover. In the entire 61 herds, but five cows were lying down. The other 732 animals were all busily engaged in the vain attempt to get sufficient feed from the scant pasture. Both these observations were made between three and five o'clock on bright afternoons when the cows would naturally be lying down if plenty of good feed were available in the pasture.

On May 11th I went out to a dairyman's farm, arriving at 6:30 a. m., and found all of his cows lying down in the pasture of sweet clover which was from eight to ten inches high. None of these cows had been out of the barn more than 40 minutes, yet they were full, lying down, and contendedly chewing their cuds.

Big Contrast in Feeding

On a ride of 180 miles from Central to Southern Illinois on May 26, 1924, not a single dairy cow was seen lying down because they had been out for several weeks on bluegrass pasture and had the grass eaten so close to the ground that they had to eat all the time—night and day—in the vain attempt to get sufficient feed. Of course, this was not through a dairy section, but most of the farmers kept a few dairy cows, and many were seen on the pastures.

In striking contrast to this, Ed. Rehling's dairy herd of 21 head was visited in Southern Illinois at 10 o'clock in the morning, May 28. The cows were all lying down. We went to the herd and they got up. We then walked away in the pasture and the cows laid down again as follows: in five minutes six cows were down; in ten minutes 15 cows were down; and in 15 minutes 18 cows were down. We then came back to the herd and every cow got up. We stood by the fence near them and in 15 minutes, 19 of the 21 head were again lying down. This is a typical illustration of what heavy milking cows on an abundant pasture will do where they can keep filled up full by grazing only a few minutes at a time.

MAXIMUM "FACTORY WORK" ON ED. REHLING'S FARM IN SOUTHERN ILLINOIS

When on sweet clover pasture, cows can lie down much of the time and save their energy for making milk.

As we entered this pasture, these cows all got up. We stood by the fence 15 minutes and 19 of the 21 head were again lying down. One cow in this herd produced 69 pounds of milk per day on sweet clover pasture without grain.

The remedy for this serious waste of the cow's time and energy in grazing the whole day over a large area of scant pasture, is to provide sweet clover which grows so abundantly and steadily that the cow can fill her bread basket with this finest of feed in a few minutes any hour during the whole summer. On good sweet clover pasture a cow can get sufficient feed for the day by eating a total time of only two to three hours, if this time is distributed at proper intervals throughout the twenty-four hours.

(Continued on page 133)

A FARMER IN GERMANY USING HIS COWS' ENERGY FOR "PLOW" WORK

This farmer did all his farm and road work with dairy cows. It took him two and a half days to plow one acre, but even this slow work reduced the milk yield of an ord[illegible], although the grain ration was decidedly increased.

THE HONGKONG DAIRY FARM

C. O. LEVINE, CHINA

HONKONG in the popular western view is "a mere dot on the China Sea". Virtually it is no more than that; actually it is the connecting link between the East and the West, a port of the greatest magnitude and one of the brightest gems adorning the diadem of the British Empire. Just a trifle over seventy years ago it was a "barren rock". Today it has close on a million inhabitants, and besides its vast mercantile interests, it is second to none in the Orient as a financial, engineering, and educational center. Long before the Dairy Farm Company came into existence, the want of a pure and adequate milk supply was acutely felt. It was the one drawback to existence on an otherwise beautiful and hospitable island.

Hongkong has no pasture lands, not even a blade of natural grass that a dairy animal could live upon. Scarred with deep ravines, strewn with the immovable wreckage of some great upheaval, a maze of pinnacle-pointed hillocks, the island offered no opportunity for the agriculturist. Blind quartz and disintegrated granite supported a plentiful but useless mountain growth, a few stunted shrubs, and here and there some clumps of distorted China pine. Such were the conditions that faced the pioneers of the Dairy Farm thirty-eight years ago. It was no land of promise they set to work upon. Yet today there exists on the southwest corner of the island what has developed into one of the big scientific dairy farming successes in the East—an institution supplying not only the dairy food requirements of Hongkong and South China, but, thanks to the extensive shipping facilities of the port, distributing its products to almost every part of the globe.

The Dairy Farm, Ice, and Cold Storage Company, Limited, Hongkong, as it is called today, owes its inception to Sir Patrick Manson, G. C. M. G., the distinguished parasitologist and first to enunciate the hypothesis that the mosquito is the host of the malarial parasite and thus an active agent in diffusing the disease. The company at present owns 1,000 cows, over 300 acres of land, with more than 100 up-to-date buildings for offices, dairies, pigs, etc., equipped with the most modern appliances, coolers, milk fillers, cold stores, etc.

By acquiring the ice manufacturing property the company now supplies the whole of the colony with ice and owns the only refrigerating stores in the colony, which stores are always well stocked with Australian frozen meats and dairy produce.

In addition to its dairying and cold storage business, the company has ham and bacon curing and meat canning branches, which are firmly established and are proving a boon to the colony and the outports of China.

Distributing the Produce

The distribution of the company's various products in the city is mostly effected by means of carriers (coolies), owing principally to the hilly nature of the country. On the lower levels of the city, however, carrier-tricycles and motor vans are used to great advantage.

The company possesses four steam launches, one motor boat, and two lighters. These are used entirely for provisioning the numerous mail liners and other steamers which call at Hongkong.

All dairy produce and fresh meat for distribution in the city are brought to the depot from the farms by closed motor vans. At the depot this is received, tested, weighed, and prepared for distribution. The company possesses up-to-date milk filling and capping machinery run by motor power and the strictest measures are enforced as to the cleanliness and the sanitary condition of the premises and the servants.

The fresh milk comes from the barns in sealed containers, is bottled in standard, wide-mouth crystal bottles, capped with fibre caps, and hermetically sealed by means of paraffin wax, thus ensuring the milk against the possibility of contamination.

The company's carriers are all housed on the company's premises in specially built quarters which, being under constant supervision, are kept in a most sanitary condition. Regulations are strictly enforced, as the company realizes the importance that men employed in the handling of food are both clean and healthy. This could not, of course, be guaranteed if the servants were allowed to live away from supervision and in the insanitary dwellings that unfortunately abound in the city.

The Central Farm on the southwest side of the island, is about four miles from the town depot. It is 500 ft. above the sea level and receives the full benefit of every breeze in summertime. So steep and rocky is the ground that despite the height above sea level being as stated, the distance direct to the shore is only about 350 yards. In the early days all foodstuffs and building materials had to be carried by coolies from the seashore to the top of the hill. The difficulty was eventually eliminated by the erection of an electrically driven overhead ropeway some 600 yards in length, a convenient connection thus being established between the commodious foodstuff stores on the farm and the wharf and go-down by the sea.

Cleanliness Emphasized

The principal dairy is the chief feature of interest on the farm. Until 1895, the only milk-collecting station consisted of a picul-stick slung from the branch of a tree for the purpose of weighing the milk. The present dairy is a modern establishment in every sense of the word, equipped with the most up-to-date appliances and incidentals.

It is imperative to take the most stringent precautions with regard to cleanliness of the native staff. Many will appreciate the constant alertness required in this connection when dealing with a class of people who often have little idea of ordinary cleanliness, let alone such cleanliness as that of which the bacteriologist takes account. The measures adopted at the dairy are thorough and, it may be said, effective. The cow boys, as well as the dairy staff, are provided with clean white clothes which are changed daily, and the men are encouraged by the provision of ample hot water to make a practice of the evening bath.

All milking and dairy utensils, bottles, etc., after being scoured three times—first in hot water with soda, secondly in lime water, and thirdly in clean water—are enclosed in a chamber and kept under steam pressure for at least one-half hour. No can is ever taken into the cow sheds until actually required for milking. On the milk being received at the dairy, it is strained and samples taken of the produce of each shed. Milk showing the slightest indication of dirty milking is not used for human consumption. That which is to be sold is run over a powerful cooler connected with a refrigerating plant, aerated, and cooled to about 40° Fahrenheit before being bottled or canned. The bottling is done by an electric bottling machine and cream is obtained by a modern electrically-driven separator. An up-to-date sterilizing plant is also installed by which milk can be either pasteurized or sterilized—truly a great boon where milk is required for children or invalids, or for a long sea voyage. Sour milk, famous for its remedial qualities in all complaints of the digestive organs, is also produced. A well equipped butter room deals with all surplus cream. After being carefully graded and pasteurized it is made into butter of either first or second grade.

Notwithstanding the special difficulties incidental to the climate of Hongkong, so far as cheesemaking is concerned, this branch of dairying also is carried on. Both Coulommier and French cheese, on the lines of Port du Salut, are produced, although the temperatures required for curing have to be regulated by artificial means. Clotted or Devonshire cream, cottage cheese, and all other dairy delicacies are produced as occasion demands.

In the laboratory or in the test room, samples of milk, cream, etc., are subjected to the severest tests, not only for butterfat but also for purity, and discovery of objectionable micro-organisms. Here a check is kept which enables the company to guard against adulteration and secure the cleanliness of the whole of the large milk from the cow shed to the customer.

The Dairy Regulations

The following are the dairy regulations:

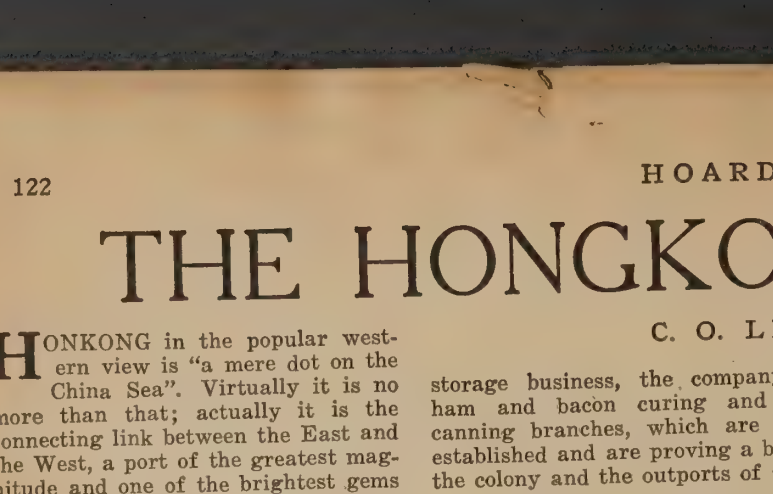
All dairymen and milk distributors must wash their hands upon entering the dairy premises and before proceeding to their various duties; washstands, water, soap, and towels are provided for that purpose.

All employed upon the dairy premises must be clean in dress and person at all times, clean white suits being provided for them by the company.

All milking utensils to be rinsed in clean water, then:—

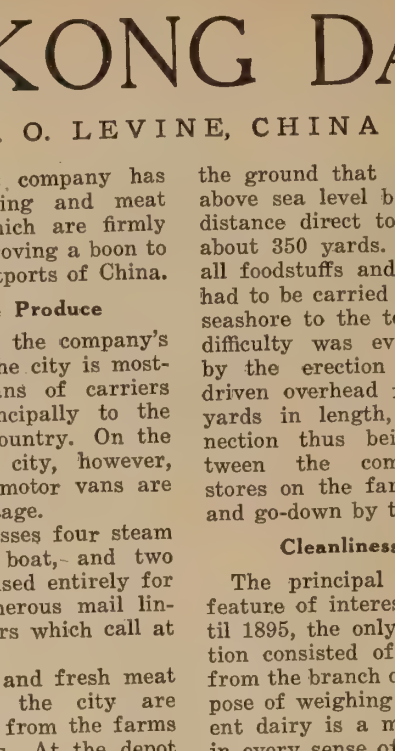
1. Washed in hot soda-water.
2. Washed in clean hot water.
3. Placed in steam chamber to be sterilized for half an hour.

All bottles on being returned by the milk distributors are to be subjected to the following routine:—



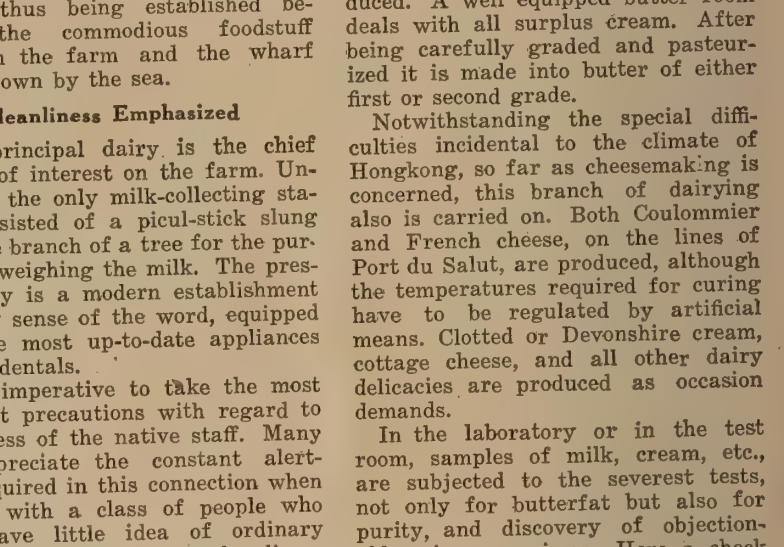
1. Rinsed in clean lukewarm water.
2. Washed in hot soda-water with revolving machine brush.
3. Washed in lime-water.
4. Washed in clean water.
5. Placed in steam chamber for one-half hour at temperature of 190 degrees F.

All ice boxes and cold stores, in addition to the usual daily washing, are to be sprayed once a week with disinfectant.



All butter churns, cheese tables, milk tables, etc., are to be scoured with lime once a week in addition to the daily washing and scalding.

All floors to be well washed at least once a day.



All roadways round the dairies to be

A typical bull barn of the Hongkong Dairy Farm. Insert at left shows the type of milk pail used, milk being drawn into the funnel that is equipped with a cotton strainer while the milker sits on the lid covering the pail.

The eight stone silos on the farm are built on the slope of the mountain with a road at the top for filling and with doors on the opposite side for removal of silage.

A barn full of Holstein heifers recently imported from England. Note the openings at the end. The sidewalls are open about one-third of the way down from the ceiling. There are also small semi-circular openings at the bottom in front of each cow.

sprayed with water once a day, or oftener if necessary in dry weather.

All employees are specially invited to report to the management at once any case of sickness amongst the staff.

The Cattle Sheds

After many years experimenting in building cattle sheds and outhouses of various types, the company devised a cattle shed which will be difficult to improve upon as far as the necessities of such an undertaking are concerned. It is white-ant, typhoon, and fire-proof—so much so that the directors have decided it to be unnecessary to effect insurance against any of the risks mentioned. These sheds are constructed of brick walls with reinforced concrete dome shaped roofs. A 3-ft. open space (with the exception of where the pillars carry the roof) runs along the entire length of both sides of the building, while the gables have ventilators at the top. In front of each animal a 10-inch circular opening is provided, ensuring the admission of pure air. The roof overlaps for three feet and protects the animals from both sun and rain. Surrounding each shed is a paddock into which the cattle are turned twice a day and, in favorable weather, all night for pure air and exercise.

The attendants' quarters are outside the shed on a higher story, erected over the cook-house and store. A plentiful supply of water from the public main is conveniently laid on. The sheds are washed out three times a day, once a week with disinfectant, and once a month with limewash. All manure is taken some distance from the shed and placed in the fertilizing pit. The cattle sheds, large and small, number seventy; there are also six hospitals for the cows and a slaughter house. The floor area and cubic content of air space per animal in each shed is three times that required by the local sanitary by-laws.

Importation of Cattle. Story of the Early Setbacks

The health and condition of the cattle have been dominating factors in the operations of the dairy farm, and the story of the company's early misfortune can only excite wonder that success was ever attained. Those who are in any way acquainted with the difficulties of securing a constant yield of milk all the year round from the same herd of cows, when reinforcements can only be obtained after a long sea voyage entailing much risk, must be quite amazed at the tremendous task performed by the company in the face of its succession of disheartening happenings. Infectious diseases, climatic conditions, stall feeding, the high cost of imported animals, serious loss on sales of useless animals—all have combined, with their separate anxieties and problems, to make definite progress a matter of extreme difficulty. It should be noted that fully one-third of the deaths among the stock are caused by rinderpest; also that the average useful life of a cow in the past has been but from three to four years. These facts alone create a difficult problem.

The first lot of cows imported from America in 1886 proving to be practically worthless, the company had to borrow funds from the directors to purchase other animals. Happily, these turned out to be more useful than the initial batch. After this, small shipments of cattle were obtained periodically from America until the spring of 1893. In that year the herd was insufficient to cope with the now greater call for the company's milk, and the directors decided to send the manager to Australia to purchase more stock. Sixty-three head were bought. Forty-three of the anmals were shipped on the S. S. "Airlie". The "Airlie" encountered a typhoon when crossing the China Sea between Manila and Hongkong. The heavy seas broke over the deck, smashed the stalls, and washed the cattle down the alleyways. Only twelve out of the forty-three were landed alive and so badly bruised that half of them died soon after they were got ashore. The company continued to import cattle from Australia for some years. Several batches of Ayrshires were obtained from Scotland and a number of the finest Holsteins from Holland.

All stud animals must conform to a very high standard before taking their places in the herd. The result of this grading up of the stock has been so advantageous that the price of milk has remained at the same figure since 1903, namely 30 cents, Hongkong currency, a pint; or in terms of United States currency about 14 cents a pint, although wages, foodstuffs, and general charges have generally doubled in cost and cows are now costing $300 to $500 (U. S. currency) landed in Hongkong, whereas formerly the cost was only about one-half this figure. The company is able to say that its milk is the only item of food supply in Hongkong, the price of which was not raised during the great war, and the directors take special pride in this fact as they have always felt that the company's goods should be within the scope of every individual in the colony.

Ravages of Epidemics

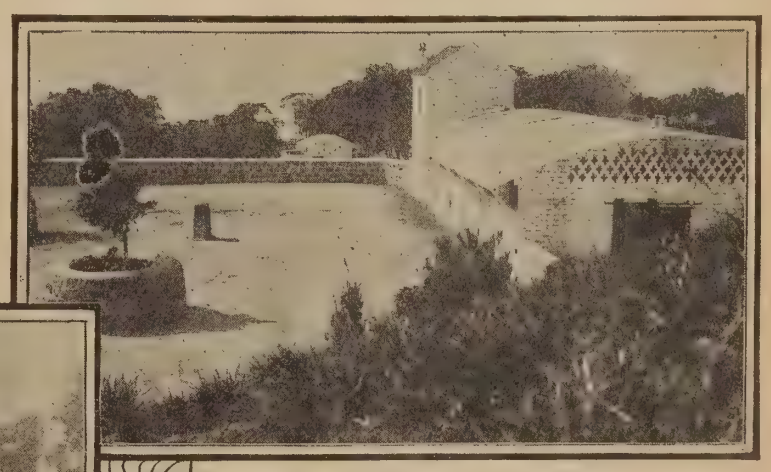
The ever-present possibility of serious diseases and epidemics in the company's herd has on several occasions become translated into grim and crippling reality. It was due to such causes that for many years real success eluded the grasp of the directors, despite the fairest promise and the most careful and skilled management.

In 1896, rinderpest made its first appearance at the company's farm. At that time the whole herd was confined to the limited space within the gates of Mains of Pokfulum. The manager at that time was not acquainted with the diagnosis of Asiatic rinderpest, but after some days it was found that the entire herd was in grave danger of being wiped out. The Sanitary Department took charge of the whole premises, engaging a squad of coolies to bury the dead animals. The coolies bolted and were replaced by others in great numbers, yet they were not able to keep pace with the rapid mortality, and the dead animals were being piled up in a heap in a cattle paddock in the center of the farm.

In 1894, the herd of cattle was doubled, and for the year 1895 a dividend of 10% was paid, leaving a balance of $24,000 to be carried forward. This sum, and a call of $10,000, made up the total amount that the company had with which to start business again and replace the lost herd of over 200 cows. The property known as Sassoon's had previously been bought, and in order not to put new cattle into the old sheds, this property was developed by converting the then existing outhouses into cow sheds. When they were completed, a "raid" was made on the Chinese dairies and sixty of their best milkers were purchased while seventy cows were imported from Tacoma. Trouble did not cease, however, for in the spring of 1897 rinderpest again broke out. Profiting from previous experience, segregation of the animals was commenced at once, and this had the effect of reducing the mortality to thirty head. Since 1896 rinderpest has made its appearance almost every year, and on one occasion 156 head died from it or from red water. During the next six years the company had a stiff, uphill fight between disease and the winning back of old customers. No dividends were paid, all available cash being invested in stock, buildings, land, and general improvements. A very efficient vaccine for rinderpest is now secured through the Philippine Bureau of Agriculture, and the company also makes vaccines of its own for use against rinderpest.

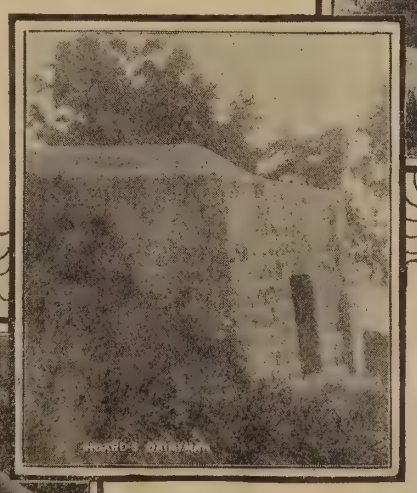
Foot and Mouth Disease

The first outbreak of foot and mouth disease occurred in 1899. It spread rapidly and in the course of one week was all over the farm. This disease, like rinderpest, seems to be most lively during the cool season. It became a hardy annual until quite recent years, but now seems to have entirely disappeared. All outbreaks of infectious disease are immediately reported to those responsible under the Sanitary Department, who take precautions to prevent infected milk from leaving the shed in which it is produced. The method customarily adopted is to lock up the infected shed or remove the animals to a segregation hospital. The attendants are given quarters attached to the hospital and the door is kept locked to prevent them from visiting their friends over the farm and so spreading the disease. No one is allowed to enter the shed without donning a suit of overalls kept for the purpose at the hospital, even boots are thoroughly disinfected on leaving the shed.



Ticks

During the early years of the history of the company, almost the whole of the stock was infected with ticks. Many animals were rendered absolutely useless and it became a strenuous fight between the cattle and the ticks for existence. The cattle won, but it took several years of war against the ticks before the company could claim their extinction in the neighborhood of the farms. For many years past not a tick has been found on the cattle. To give some idea of the great amount of labor necessitated, and the seriousness of the pest before it was got under control, it might be instanced that as many as three boys have been engaged in picking ticks off one animal for three whole days.



Guinea Grass Cultivation

One of the difficulties in the early days was the production of sufficient green fodder to give variation to the cattle feed. Many experiments were carried out with different plants with a view to selecting the most suitable forage to meet the conditions of the climate and soil. With intense cultivation, fair crops were obtained from cereals such as millet and maize, but it was impossible to find sufficient ground to produce in one crop per annum enough forage to meet all requirements. Experiments with alfalfa were persisted in for about twenty years without any material success. The much advertised spineless cactus, said to be the heaviest cropper per acre of anything on earth, was also a "wash out". After the foregoing experiments, attention was entirely given to Guinea grass as the most suitable plant to meet local conditions. Farmers in America would have a grievance, if, after having purchased virgin ground, cleared it

(Continued on page 141)

One of the several cow barns, all of which have brick walls and a roof of reinforced concrete. At the left is the exercise yard, back of which the upper part of a bull barn shows. While not so advised by the author, the editors imagine the forage in the foreground to be the "Guinea Grass" which seems to be the main forage reliance of the herd.

Near each cow barn and located on a side hill will be found a manure pit.

Every evening at five o'clock, if the weather is not too severe, the cows are turned outside for the night in the yards surrounding each barn. That trees are precious is indicated by the stone walls built around each tree.

NEW YORK EXPERIMENT STATION JERSEYS

Comparative Value of Bulls Used

A. C. DAHLBERG, NEW YORK

A BRIEF study of the breeding of the bulls used in the Experiment Station herd will enable one to obtain an idea of their value. The sires of the bulls were all at the head of a fine herd of pure-bred Jerseys. Their value was considered greatly in excess of those used in the Station herd. The sire of the first bull calf won the first prize in his class at the New York State Fair in 1893. He had four daughters that produced 14 pounds butter in seven days. Although the dam of this bull was never tested officially, she was said to be a heavy producing cow. The sire of the second bull used in the Station herd was from untested stock but he was an excellent individual and his pedigree included good producing animals. The dam of this calf had a Register of Merit record of 473 lbs. fat and her sire was a highly commended Island bull. The third bull was especially well bred. His sire was a well known bull of popular show and producing blood lines. His mother had a Register of Merit record of 568 lbs. fat. The sire of the fourth bull was in the Register of Merit and his dam had a record of 520 lbs. fat. Neither the dam nor the sire of the fifth bull was ever tested but the two grandams had an average record of 715 lbs. fat. Both grandsires had several high producing daughters. Likewise the dam and sire of the sixth bull were both untested but the dam was known to have produced 450 lbs. fat in twelve months and the sire was a bull of good type.

It is evident that the bulls were all of good breeding but they did not represent the best that money could have purchased. Bulls of similar production breeding can be purchased today at a price within the reach of nearly all dairymen so that from a cost basis there is little excuse for the existence of the scrub bull. When the first bulls were purchased little Register of Merit work had been done so that bulls from cows tested for production were relatively scarce. Bulls now in service at this station are from stock of established producing ability and all bulls used in the future will come from Register of Merit stock. Likewise all bull calves sold by this experiment station are from tested cows and in most cases their mothers are the fourth generation of females that have produced over 400 pounds fat on private or semi-official test.

The production records of the daughters of these bulls are more uniform than one would expect them to be. Table 1 shows the value of the bulls in getting daughters that exceed or are inferior as producers when compared with their dams upon the basis of yearly butterfat records. The table includes only the records of those cows that are ancestors of the cows in the herd in 1923, for the reason that if the progeny of a cow is not represented in the herd her breeding has been lost. The first two bulls used improved the production of the herd; the next three decreased it; and the last one increased the production records. The third, fourth, and fifth bulls had to be better bulls than the first two if they were to show an increase in production because they were bred to higher produeing cows. This illustrates the well recognized breeding principle that a good bull will increase production in a poor herd but it takes an extremely fine bull to increase production in a high producing herd. It is interesting to note that the daughters of bull No. 4 have now been eliminated from the herd but this blood line has not been lost because a few of his granddaughters remain. The fifth bull made the poorest record of all, due to two very poor producing heifers but he also got four very good producing heifers. His progeny vary more than those of any other bull.

All of the bulls purchased at a yearly cost of $31.82 produced daughters that gave an average of 350 lbs. fat per year as mature cows. For the general dairy farmer these cost prices of the bulls used and the production of their daughters are well worthy of consideration.

Herd Production Records

To the breeder of dairy cattle who is making sensational records and improving the general average of his herd and possibly of the breed as a whole, the Station herd may be somewhat disappointing. No effort has ever been made to obtain the best sires and females offered by the breed and no female has ever been handled to produce her maximum yield of milk and fat. Economical breeding and feeding practices that the dairymen producing milk or butterfat for profit could follow have been adhered to rather than those practices followed by some breeders whose chief concern is the greatest production from the best cattle regardless of cost.

Table I—Influence of Each Bull Upon Fat Production

Bull No.	Years in herd	No. of daughters (in ancestry of present herd)	Daughters' fat records Increased Lbs.	Decreased Lbs.
1	1901—1907	3	69.0	
2	1904—1912	9	37.1	
3	1908—1913	4		19.5
4	1910—1916	4		36.0
5	1913—1919	8		61.4
6	1915—1919	5	19.6	

The two foundation cows produced approximately 350 lbs. butterfat per year. Since that time production has increased and decreased, reaching its lowest point in 1921 with 337 lbs. fat and its peak of production in 1923 with 407 lbs. of fat. The low production in 1921 resulted largely from scanty feeding due to the high price of concentrates and failure to weed out a few boarder cows because of the cost of growing heifers to replace them. The reasons for the high production of 1923 are also self evident. More liberal feeding was practiced and the heifers proved to be above the customary average. In 1923 only one cow in the herd produced less than 300 lbs. butterfat.

Slow progress in increasing herd production has been due to several causes. The foundation cows were good producers which made it more difficult to obtain still higher records. The necessity of increasing the size of the pure-bred herd made it imperative that too rigid consideration could not be given to the quality of the animal. It is probable that for many years practically all profitable pure-bred females have been retained in the herd. The question of sires is of major importance in the attempt to increase the production of a herd. The author believes that very good production was obtained in the past from the Station herd especially when one considers the financial limitations in the purchasing of bull calves. Increased production above the present standard can be accomplished only if a bull capable of imparting greater production on an average in his daughters can be found and purchased or selected in a promising bull calf. It is evident to breeders that such an animal is worth many times the purchase price of bull calves used during the past. If such a bull is obtained it is probable that some of his daughters will not excel the poorest cows now in the herd. Careful selection and management must be exercised to raise the average production of the herd, no matter how good the sire may be.

Feed Records

About three years ago when the author left the Middle West and came to New York, he was astonished at the difference in feeding practices in the eastern and middle west states. In Wisconsin and Minnesota the customary recommendation is to mix some high protein feed, such as oil meal or cottonseed meal, with about 3 to 5 times its weight of farm grown grains and the resulting mixture was used as a balanced grain ration to be fed with a legume hay and corn silage. In the eastern states such recommendations are seldom heard and much talk is current about the 24% ready mixed grain ration. To one unfamiliar with the situation here it is surprising to learn of the large number of farmers feeding the 24% ready mixed grain ration. As might be expected, however, some farmers are feeding no protein concentrates whatever.

The grain ration has always been mixed in the barn and has been built upon feeds available to the average farmer, namely, corn, oats, bran, and middlings. These grains have been supplemented with high protein feeds to balance the ration. So far as the author can ascertain, the percentage of crude protein fed to the station herd has never exceeded 22 and has never been less than 17. The grain mixture has contained an average of 18 to 19% total crude protein or about 15% digestible protein. The hay has consisted quite largely of alfalfa or clover of mediocre quality with about one-quarter timothy and orchard grass. Corn silage has always been fed throughout the year because the pasture has not been ample to meet the needs of the herd. Grain has been fed in such quantities that a mature cow receives 1 pound for each 2½ pounds of milk testing 5.5 to 6.0% butterfat when calculated on the yearly basis including the dry period. The amount of grain is varied according to the condition of the animal as well as her production.

The grain mixture that has been in use with slight deviations, due to prices for the past two years, contains 18—19% of total crude protein and consists of bran, oats, corn, and linseed oil meal, mixed in approximately equal parts by weight. Oats have been a few dollars a ton higher than bran in price and since they are so much alike in their nutrient composition the quantity of oats has been slightly reduced. A limited quantity of wheat middlings, peanut meal, and gluten meal have also been fed. The feed boat holding 450 lbs. of grain has been mixed full when needed as follows: Bran, 140 lbs.; oats, 90 lbs.; corn, 100 lbs.; oil meal, 120 lbs.; salt, 3 lbs.; and steamed bone meal, 3 lbs.

This mixture is simple and easily prepared. The salt is added for palatability and the bone meal to increase the amount of minerals. They were recently added to the ration and the only noticeable effect of their addition was the increased appetite of the cows for the grain due to the salt. The grain ingredients have been purchased in one- or two-ton quantities on the open market at such a price that this mixture has varied in cost during the past two years from $31 to $41 per ton.

To many dairymen there is nothing unusual in this grain ration; to others, it is a luxurious feed; and to some dairymen it is almost an insult to the cow. Several farmers who have visited the Station herd have emphatically stated that they would not feed such a cheap, low-protein grain mixture to their cows. A grain dealer in New York State who wrote for the Station grain formula advised that he could sell nothing but the 24% mixture because his trade demanded it. Representative of the other extreme

(Continued on page 142)

THREE DAUGHTERS OF THE SAME BULL. THEY HAVE REGISTER OF MERIT RECORDS WHICH AVERAGE 540 LBS. FAT IN ONE YEAR

Cow Testing Associations

Following is a summary of reports received during the week and up to the time of going to press of this issue:

Association Notes by Testers

Wellsville—College Ward, Utah: The 501 cows tested in July produced an average of 791 lbs. milk, 29.98 lbs. fat. Eighty cows produced more than 40 lbs. fat. Some dairymen are mowing their pastures, a good practice to follow where land is irrigated, removing the old, unpalatable grass and giving the pasture an opportunity to renew its growth. The condensery paid 42 cents per lb. for fat.—R. Hansen.

Watertown, South Dakota: Alfalfa acreage has been increased considerably and more silos are being erected. Market milk sold for $2.00 per cwt. and retailed for 10 cents per quart.—H. E. Erickson.

Mesa Co., Colo.: The high herd shows an average of 45 lbs. fat per cow. There were 26 forty-pound cows in July compared with 21 for June. Market milk sold for $2.90 per cwt. and retailed for 12½ cents per quart.—C. H. Boyd.

Southside, Va.: Three herds were tested for T. B. and all passed clean. Pasture is short, the hay crop good, and corn promises only a mediocre yield. Market milk sold for $3.93 per cwt. and retailed for 15 cents per quart. The cheese factory paid 43 cents per lb. for fat.—C. A. Buck.

Henrico Co., Va.: The average production of the 640 cows tested was 613 lbs. milk, 24.3 lbs. fat. Three herds averaged over 30 lbs. fat. O. C. Hedrick's herd of 25 Holsteins made the highest average of 33 lbs. fat. X. Beck is leading the association in yearly herd production. In 9 months his 18 Holsteins averaged 7,834 lbs. milk, 275.7 lbs. fat. Grade A market milk sold for $4.71 per cwt.; grade B, $4.05.—S. Simpson.

Fairfax Co. No. 1, Va.: An exceptional clover crop has been harvested. All members feed grain to supplement pasture. Dry weather lowers silage prospects from late planted corn. A considerable acreage of soy beans makes the cows smile in anticipation. Virginia, Wilson, and Mammoth Yellow are the leading varieties. Fourteen acres of Mammoth Yellow outyielded 32 acres of the other two, but Virginia makes the best quality hay. Market milk sold for $3.48 per cwt; cream, $1.30—$1.45 per gallon. Milk retailed for 14 cents per quart.—C. E. Snell.

Hancock Co. No. 1, Ia.: This association started its first month with 25 members and 371 cows. Two separators were found to be faulty, one losing its owner almost 50 cents per day. The creamery paid 44 cents per lb. for fat.—H. W. Tiggeman.

South Dakota Co., Minn.: New seedings of alfalfa are in A-1 shape. Soy beans are a very good prospect. Some alfalfa cuttings from first crop are yielding 2 tons per acre. Market milk sold for $1.85 per cwt. and retailed for 11 cents per quart.—F. R. Lee.

Kanabec Co. No. 1, Minn.: Two herds were tested for T. B. and no reactors found. Twenty-two purebred sires are used, 25 members have silos, 10 feed grain, 2 milk 3 times daily, and feel that it pays for the high producing cows. The creamery paid 43—45 cents per lb. for fat.—H. E. Sutton.

Kane Co. No. 3, Ill.: Ten cows gave over 60 lbs. fat and 23 over 50 lbs. in July. Fourteen herds are under federal supervision.—W. P. Schmit.

Elkhart Co., Ind.: The average production of the 267 cows on test in July was 827 lbs. milk, 31.4 lbs. fat. Thirty-nine cows produced over 40 lbs. fat, 16 over 50 lbs., and 6 over 60 lbs. I. W. Miller had the high herd of 7 cows which averaged 45.16 lbs. fat. Market milk sold for $1.80—$3.12 per cwt. The condensery paid $1.80. Milk retailed from 8—10 cents per quart.—W. D. Campbell.

Plover—Marathon, Wis.: One new barn is being built and one was whitewashed. One member installed drinking cups. The cheese factory paid 38 cents per lb. for fat; the creamery, 39 cents.—A. G. Elbert.

Sheldon, Wis.: One more member installed drinking cups. A 10 per cent saving was made on buying scales by the dozen lots. By substituting gluten feed for ground corn and oats, a saving of $5.20 a ton on the summer ration was made. One new barn was built with modern stanchions and drinking cups. The corn crop is very short and pastures good.—G. E. Ronne.

Culver, Ind.: Several members purchased their foundation purebreds at the Indiana State Holstein sale. One herd, depending on pasture alone for June, dropped 10 lbs. fat per cow compared with the previous month. In July, by feeding a grain ration with pasture, an increase of 5 lbs. fat per cow was realized. Market milk sold for $2.10 per cwt. and retailed for 10—12 cents per quart.—W. R. Matthews.

Linn Co. No. 2, Ia.: This association completed its first year's work in which time 10 pure-bred bulls were purchased and 68 cows were found unprofitable. In July market milk sold for $2.10 per cwt. The creamery paid 43 cents per lb. for fat.—C. J. Moore.

Osage—Lyon—Franklin, Kans.: All but 4 members supplement pasture with dry feed. The second crop of alfalfa is practically all harvested. Every member feeds alfalfa. Three members use Sudan grass for pasture with satisfactory results. The condensery paid 42 cents per lb. for fat; the creamery, 35 cents. Milk retailed for 10—12 cents per quart.—J. C. Coffman.

Kane Co. No. 2, Ill.: The 542 cows tested in July averaged 763 lbs. milk, 26.3 lbs. fat. Even the best dairymen were unable to keep up production last month. Another herd was tested under federal supervision and no reactors found. Another milking machine was installed. Market milk sold for $2.50 per cwt. and retailed for 10—13 cents per quart.—W. K. Bullock.

Easton, Minn.: During July 32 cows produced 42 lbs. fat or more and 18 herds made 25 lbs. fat or over. There were 92 pound-a-day cows. The association average of 271 cows tested was 769 lbs. milk, 28.2 lbs. fat.—A. Nelson.

West Allegan, Mich.:—One member whitewashed his stable. Another sealed his stable over head. The average of the association is 556 lbs. milk, 26.58 lbs. fat. The creamery paid 38—40 cents per lb. for fat.—L. A. Wilcox.

Sparta—West Kent, Mich.: Two adjoining counties are making clean-up tuberculin tests. Wheat and oats are good but corn and beans are slow on account of an extremely wet season. Hay is exceptionally good but hard to cure. The condensery paid $1.75 per cwt. for 4 per cent milk.—L. Woodhams.

Tomahawk, Wis.: One member bought a milker. Two bad separators were repaired. All members own or use registered bulls and all have silos except three. Market milk sold for $2 per cwt. The cheese factory paid $1.40 for milk.—W. S. Schneider.

Colesburg—Two Co., Ia.: One new separator was purchased. One of the 5 cars of feed purchased on the low market has arrived and is being fed with pasture. The last of the silos purchased last spring has been erected. This association completes its year's work next month and nearly all old members have signed up for another year.—G. H. Crawford.

West Dakota Co., Minn.: Second crop alfalfa looks good. Red clover also looks fine. The association average for July of 454 cows tested was 650 lbs. milk, 25.6 lbs. fat. Fourteen herds averaged over 25 lbs. fat and 43 cows made over 40 lbs. fat. Market milk sold for $1.85 per cwt.—L. L. Hammond.

Kalamazoo No. 2, Mich.: All members but 3 have fed grain all summer. Ten members keep daily milk records. Pastures are good although production has dropped off somewhat the last two months. Market milk sold for $3.00—$3.20 per cwt. and retailed from 13—15 cents per quart.—J. E. Fleming.

Alpena—Leer, Mich.: The association average for July was 720 lbs. milk, 30.6 lbs. fat. Forty-three cows made over 40 lbs. fat, 6 over 60 lbs.—C. Jennings.

Muskegon—Ravenna, Mich.: The T. B. test has been about completed in this county. Two barns were whitewashed. Farmers are busy disinfecting. Market milk sold for $2.40 per cwt.; the condensery paid $1.60; the creamery, 45 cents per lb. for fat.—G. Rockel.

Tennyson & Dickeyville, Wis.: During July 12 cows produced over 50 lbs. fat, 56 over 40 lbs. The highest herd average of 39.3 lbs. fat was made by J. Kowalski. The cheese factory paid 37 cents per lb. for fat; the creamery, 40—41 cents.—J. Aufdermauer.

Milton—Edgerton, Wis.: Two Holstein bulls from this association are now with the Rock County show herd. One more herd passed another clean test for tuberculosis. G. W. Holliday, who supplies Guernsey milk, has a low bacteria count for this time of the year of 4,700 per c.c.—W. H. Roberts.

Verona, Wis.: One farmer is pulverizing limestone. Two silos are being built and one old one replaced. Market milk sold for $1.85 per cwt. The condensery paid $1.55; the cheese factory, $1.32.—G. W. Weihing.

Remey, Wis.: Cows are going down hill this month on account of flies and heat. Herds being grained are not falling off in production. The cheese factory paid $1.50 per cwt. for milk. Milk retailed for 10 cents per quart.—H. A. Robinson.

Bruce, Wis.: Twenty-eight members had one or more cows producing more than 40 lbs. fat in July. There were 58 quality cows; 8 of these produced more than 50 lbs. fat. Two members erected silos.—C. W. Rye.

Rives—Jackson, Mich.: Two herds were tested for tuberculosis and two reactors found. A meeting for the associations in this county is planned for August 22. Very heavy crops of alfalfa and clover are in this section. No more separators run backward. Market milk sold for $2.50 per cwt. The condensery paid $1.60 and the cheese factory $1.59 for milk.—J. Bird.

St. Clair No. 2, Mich.: One member installed a ventilating system in his dairy barn and another has a new milking machine. F. R. Watkins purchased a registered Jersey bull and is proud of the only 100 per cent purebred Jersey herd in this association.—J. N. Ingland.

Spring Green—Wyoming, Wis.: This association had a pleasant picnic at the state park the 2nd of August. Calf club calves were judged and prizes awarded. Professor Humphrey gave a talk on summer feeding.—V. H. Dani.

Over 3,000 persons attended the annual Lawrence—Barry, Missouri, Cow Testing Association meeting held at Mt. Vernon, July 24th. The meeting was held on the farm of the Missouri State Sanatorium and is considered to be the largest dairy meeting held in Missouri this year. Talks were given by W. B. Barney, fieldman for the National Holstein Association; E. M. Harmon, dairy specialist of the Missouri College of Agriculture; A. C. Oosterhuis, extension agent of the Carnation Company; and E. G. Bennett, state dairy commissioner.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00 including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Coming Events

Sept. 14-20—Eastern States Exposition at Springfield, Mass.

Sept. 27-Oct. 4—National Dairy Show, Milwaukee, Wis.

Sept. 22-28—Dairy Cattle Congress, Waterloo, Iowa.

Oct. 21-23—Wisconsin Buttermakers' Asso. meets at Chippewa Falls, Wis.

Nov. 1-8—Pacific International Live Stock Exposition, Portland, Ore.

Marathon County, Wisconsin, has planned an exhibit at the National Dairy Show that will include three or four carloads of the various breeds of dairy cattle, a carload of boy and girl club calves, and other things connected with the dairy world. It is Wisconsin's largest county and an important dairy center. William Rogan is the county agent.

Where the Moon Drains the Land

HOARD'S DAIRYMAN:—The moon works nights in most parts of the world and, in this day of shorter hours, its value to the farmer is not generally considered great.

In the dairy district near the mouth of the Columbia river in the Pacific Northwest, however, the moon is one of the greatest allies of the dairyman. And, moreover, it works night and day in his behalf.

The dairying is conducted on an enormous tideland area which differs from what is usually considered tideland in that it never floods. Neither is it sufficiently wet to cause trouble. Much of the tideland is diked, but in some places even this is not needed. The tides are controlled by tide gates, which are in effect large valves or boxes with a hanging door which swings outward. As the tide rises the pressure of the water holds the door tightly closed. When the tide falls the recession of the water in the tidal sloughs which run here and there over the land forces the gate open and the water pours out.

Artificial pumping is as unknown as floods. The land which is thus drained by the moon's influence in sweeping the tides out lies about the city of Astoria, which is situated on the Columbia river where that stream varies from 3.5 to more than 20 miles in width, with a width opposite the city of 7 miles. Regardless of how great freshets become inland, they have no effect whatever on this enormous body of water.

The district and its characteristics of soil and climate have been likened closely to that of Holland. Dairying is the natural agricultural activity in a section where there is excellent green pasture for the cattle during the entire year. Snow rarely lies on the tidelands for more than a week all told during the winter, and the frosts are never severe enough to cut down the grass. On the other hand, the cool summers and abundance of moisture in the tidelands prevent the pasture from being burned up during the summer months.

The dairymen are finding that, if they take advantage of these weather conditions properly, it is utterly unnecessary to give the cattle feed or grain at any time of the year. With pasture the year round they are able to depend largely upon this. The pasture is supplemented with root crops and a small amount of ensilage.

Oats and vetch grow with remarkable success on the tidelands once the ground is sufficiently inoculated for the culture of the legume. This crop is extensively used for ensilage.

The turnips and rutabagas flourish and an average yield of 35 tons to the acre is common where care is taken to counter the root maggots. The dairymen have learned to do this effectively and economically by late planting. For best results the root crops are not planted until late June, under average weather conditions. A long, warm fall gives plenty of time for the roots to mature, the plants not coming up until after the egg-laying season of the maggot moth. Direct seeding is universally used for these root crops, it having been found unnecessary and poor economy to transplant the roots.

This general use of pasture, roots, and ensilage makes extensive storage barns superfluous, while the mild winters cut the cost of farm buildings by making but light shelter necessary for the animals.

Oregon. J. DEWITT GILBERT.

Bank Loans for Cows

HOARD'S DAIRYMAN:—The smallest local bank in one of the smallest counties of Georgia was first in the state to avail itself of the new $5,000,000 federal fund set aside, in the creation of the twelve Federal Intermediate Credit banks, for the use of farmers desiring to purchase live stock.

That bank was the People's Bank of Tignall, Ga., one of the smallest banks in the entire state, and the smallest bank in Wilkes County. The amount which it set aside to secure these funds of the government was $10,000—an amount entitling it to $100,000 of the government's new relief fund for dairy and live stock farmers.

But that wasn't all.

In the meantime, the secretary of the Tignall Chamber of Commerce had drawn up a form of contract between the bank and farmers desiring to start dairy herds and had signed up fifty farmers ready and "rarin' to go".

The contract was good—so good that I am going to reproduce it in full for other farmers and bankers who may want to secure a share of this new fund and yet be properly protected in the new enterprise. It reads as follows:

"I hereby authorize ——— to purchase for me ——— cows of dairy breed, at a price not to exceed ——— per head, this to include the cost of purchase, transportation, and insurance. The age of the cows is to be from two to seven years. I agree to receive and to settle for said cows on notice of arrival, and to execute a promissory note for any deferred payment secured by bill of sale on said cows, and an obligation to pay on said note with every other cream check.

"Any offspring disposed of shall be applied to this cow debt. I further agree that I will be personally responsible for the care and attention of said cows and their products.

"In consideration of ——— assisting me in the purchase of said hogs, and securing credit therefor, I agree to keep the necessary hogs and poultry to consume the surplus skimmilk from said cows.

"I further agree to cultivate and grow not less than three acres of feed crops for each dairy cow kept on the farm, the variety of these crops to be recommended by the county agent.

"If I fail to carry out this agreement through fault or negligence on my part, I agree that said ——— shall have the right to re-possess the said cows without notice. I further agree that any payment made by me on said note shall be liquidated damage to be applied as rent on said cows in the event that they are re-possessed by ———.

"It is understood that should any of the said cows die before being paid for that that portion of their cost shall revert to me."

Every contingency was thought of and carefully covered, in the contract, even to the death of the cows which were to be insured. The farmer could not lose on the proposition unless he deliberately laid down on the job—in which case the cow simply reverted to the bank to be sold to some better and more intelligent farmer.

Is it any wonder that Guy Guthridge had no trouble in signing up fifty farmers before the bill had even passed the Senate?

At the same time, the bank was adequately protected. It got 7 per cent interest on the notes signed by the farmers. It received each month 2 substantial payments on every cow secured. It secured the offspring of the stock to sell and apply on the notes. In the case of death it was protected by insurance and in the case of carelessness, the contract provided that it could take the animals away and re-sell them to some farmer who would care for them.

At present, the People's Bank has its fund of $10,000—and a drawing account of $100,000, you might say on the district Intermediate Credit Bank. Cows are now being purchased for fifty farmers in the district—the first installment of many. And it is expected that more than 1,000 dairy cows will be placed in Wilkes County in the next two years as a result of this quick action.

The South may be slow—but not in the matter of going out after more and better live stock. Her farmers have been taught the bitter lesson of the one-crop system and they are going into dairying in a way that will soon put them on their feet.

Georgia. J. H. REED.

WINIFRED HOTALING PONTIAC

A new Holstein champion for California is Winifred Hotaling Pontiac who now holds the state's highest record for butter production in ten months as a junior three-year-old. In the herd of W. J. Higdon this cow produced 21,283.1 pounds milk containing 723.67 pounds fat—equivalent to 904.5 pounds butter. Her butter record is third highest in the United States among animals of her age.—Extension Service, Holstein-Friesian Ass'n. of America.

"If you would be wealthy think of saving as well as getting."—FRANKLIN.

Judging Dates

Minnesota State Fair

Sept. 1—Brown Swiss—Judge, Earl Weaver, Iowa.

Sept. 2-3—Holsteins—Judge, T. E. Elder, Massachusetts.

Jerseys—Judge, R. S. Hulce, Wisconsin.

Guernseys—Judge, Earl Weaver, Iowa.

Sept. 4—Ayrshires—Judge, R. S. Hulce, Wisconsin.

IN THE DAY'S WORK

It's All Been Done

ELWOOD ERICKSON, NEW YORK

HOW often the feeling comes over us as we note the marvelous achievements of this wonderful age in which we live that it is no longer possible for anything new to be done. It seems as though the last word has been spoken—the last deed done.

We pick up a fine book and as we read it seems to sum up all that we have ever thought. We could not add or take away a word though we would. It bears a note of finality.

We watch an intricate machine, like a printing press, at work and it moves with an almost human intelligence. Apparently nothing more complete can be constructed.

Years ago the senior senator of Massachusetts was being replaced by a younger man by the name of Chas. Sumner. As the old gentleman was coming down the steps of the Capitol building, he met his young successor and taking him by the hand he said to him, "Young man, you are too late, all the big things have been done."

The old gentleman was wrong, all the big things have not been done. They are still being done, they are still to be done. H. G. Wells in his popular book, "Outline of History", after a survey of the great events in the history of mankind, comes to the conclusion that we are just beginning to stand on the threshold of knowledge which later generations shall enter. We are getting intimations of bigger things yet to be.

And as one reveiws the achievements of our own day this prophecy is trustworthy. Wireless and radio, telephone, and telegraph, and wonders still to come. Just recently a successful experiment was made of transmitting pictures over the wire, portending the time near at hand when we may behold the world's events as they are being enacted.

The fact of the matter is that new wonders never ceasing are being revealed to the astonished gaze of man. For life is not a static affair but energy that is constantly expressing itself in new forms and new channels. Life is full of surprises. It is dramatic, expectant.

Often where least expected, a new secret is wrested from the close grip of nature. Men stumble on her treasures. A group of Phoenician sailors many years ago carrying on their ship a cargo of saltpetre came to a sandy beach and wanted to make a fire. No stones were near at hand and some of the lumps of saltpetre were used around which the fire was built. The saltpetre melted with the heat and fused with the sand and the result was a clear mass which today we know as glass.

Locked up in that treasure house there are still those many secrets which we stumble upon that he that has a seeing eye and a hearing ear detects and puts to the use of his fellow men.

It is always stimulating to review the possibilities of life. For many of us have to live our lives in a narrow and prescribed circle of rather irksome duties which shut out the vast varieties and potentialities of living. And we often conclude with the old senator that the big things have all been done. At least it seems so to us. We have our task and it is all exclusive. But I like to think of the yet to be. No matter how dull and uninteresting the present, there is still that unknown potential future out of which there may arise the unanticipated joy.

This duty now chafes and restricts. It is dreary and dull. But as I perform it faithfully, out of my fidelity there comes without plan or procedure on my part a fine reward. It is like to a man walking around in a narrow room and suddenly his hand touches a spring which opens a door out into a garden. The room gave no token of the garden's presence just the other side of the wall but the garden was there and he finds it who day in and day out is walking his pathway of life with sturdy stride.

And that is why it is such a glorious thing just to be alive. Life's greatest gift to man is life. We live in a world of wonders which are constantly being revealed to us. And all through the journey of the years we are sustained by the enheartening thought of expectation. Every advance in science, every accomplishment in industry, in crafts, are merely presages of the something which is still waiting to be revealed.

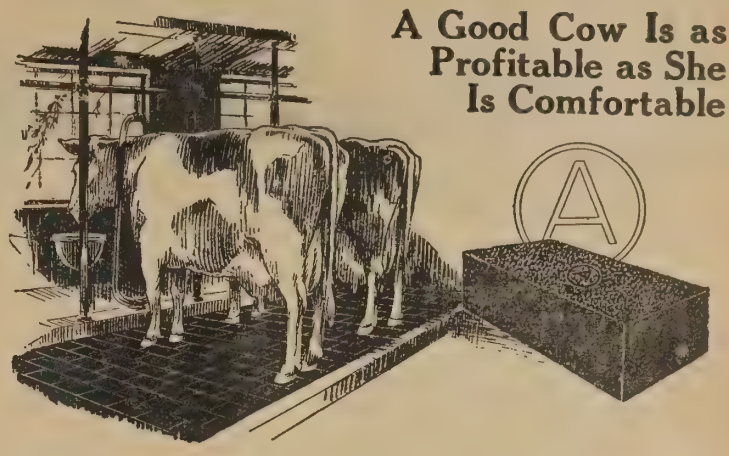
So, we shall go through the years allotted to us on this planet dull and unmoved, when every golden minute has its riches for us? Let a man live expectantly, live on tiptoe, and though his accomplishments have been meagre his life will have been a glorious venture.

"Grow old along with me
For the best is yet to be."

Book on Co-operative Marketing

Co-operative marketing of farm products has been growing as never before in the last few years. It is a subject which is being talked about on all sides. What is the significance of this movement? What progress has been made? What are the objects in view? What are the possibilities of these developments? What are their limitations? What are the problems involved? What plans of organization have been worked out?

"Co-operative Marketing of Farm Products" by O. E. Jesness takes up these and many other vital points. The experience of the author in this field makes him exceptionally well qualified to discuss these questions. He has had intimate contact with the co-operative marketing movement, being a native of Minnesota, a state which is a stronghold of co-operative marketing, and having been connected with co-operative marketing work and investigations in the U. S. Bureau of Markets and Universities of Minnesota and Kentucky for a number of years.



This book first takes up the development of co-operative marketing for specific commodities, such as grain, dairy products, live stock, fruits and vegetables, tobacco, cotton, wool, and poultry and eggs. Representative organizations for different commodities are described. Co-operative purchasing and general agricultural associations are also discussed. The book then takes up in detail questions of pooling, essentials for success, crop contracts, organization forms, financing, how to organize, incorporation, co-operative laws, relation to antitrust laws, possibilities of monopolies, and future prospects in the co-operative marketing field. The book also has an appendix with a wealth of material relating to co-operative marketing, including among other things the contract forms of The California Fruit Growers' Exchange, The Dairymen's League Co-operative Association, and the Burley Tobacco Growers' Co-operative Association.

The book is one of the series of "Lippincott's Farm Manuals" and sells for $2.50. It may be ordered direct from the publishers or from Hoard's Dairyman Book Department.

BUTTERCUP OF ROCKY REACH
OWNED BY LOUIS MERRYMAN OF MARYLAND

This Guernsey cow recently completed a record of 14,850.6 lbs. milk, 626.63 lbs. butterfat, the state record in Class AA. A stablemate, Gerar Fanny, broke the state record in FF with 10,253.4 lbs. milk, 529.6 lbs. butterfat.

A Good Cow Is as Profitable as She Is Comfortable

IN the pasture Nature provides footing that is yielding, resilient, comfortable; in the barn Her Majesty the American Cow, demands the same sure and comfortable footing.

And to show her appreciation she makes barn-floor comfort pay—in steady, consistent, generous yield. For a good cow is as profitable as she is comfortable.

Circle A Cork Brick floors are resilient, warm, slip-proof and dry—and, best of all, they are economical.

You can put in this floor with assurance that it is an investment for permanence—that it will serve the daughters and grand-daughters of your present herd—and help increase *their* daily yield.

A sample brick will be mailed free—write for it. Also the 32-page, illustrated book, "Circle A Cork Brick," giving complete information. Address Armstrong Cork & Insulation Company, 112 Twenty-fourth Street, Pittsburgh, Pa.

Circle A Cork Brick Floors
FOR DAIRY BARNS AND HOG HOUSES

WANTED —100,000 TONS of late unmatured, frosted CORN to be put into the SILO to be used for feed this winter, instead of being wasted. To store this amount of ENSILAGE will require 1,000 ONE HUNDRED-TON METAL SILOS.

We have the METAL SILOS if you have the CORN. Don't convert into manure what can be made into *Palatable, Milk Producing Feed.*

You have plenty time to order a METAL SILO and erect it. *We guarantee prompt shipment,* as well as the *price.*

Your Bank Reference is all we require.

EDITORIAL COMMENT

LAST year members of the Wisconsin cow testing associations sold 5,000 of their unprofitable cows for beef. They also sold nearly 4,000 cows, with yearly records, for dairy purposes. If all dairy farmers were culling their herds as closely as members of cow testing associations, there would be no surplus dairy products anywhere.

MANY letters received by Secretary of Agriculture Wallace suggest that some method of curing foot and mouth disease should be found. These men forget that foot and mouth disease has been a subject of much study and that the problem is not how to cure the disease but rather how to destroy the germs which cause the disease. Our government wisely decided to bury all infected and exposed animals. This, so far, has proven to be the better course to take, even though some method of curing the disease could be found.

It may be stated that in countries where they have tried to find a cure for foot and mouth disease it has escaped from the research laboratories. Notwithstanding especially equipped buildings and the exercise of every known precaution, the malady could not be prevented from jumping from one barn to another. Foot and mouth disease is very contagious and while the slaughter and burial method may seem cruel and unnecessary, it is still the best way of handling this disease.

WISCONSIN AN OBJECT LESSON

Some few weeks ago 135 bankers, farmers, editors, county agents, and business men from the states of Missouri, Oklahoma, and Kansas visited Wisconsin. They spent four days in this state and visited many dairy farms, inspected many fine herds of dairy cattle, and visited creameries, cheese factories, condenseries, etc. Upon their return home resolutions were passed by this body and we quote the following from them:

"The most outstanding condition which was evident in every county visited was the fine co-operation among the bankers, business men, county agents, college representatives, cow testers, and all others with the farmers in every activity looking to the betterment of conditions and increased prosperity. This co-operation has brought about a most prosperous and wholesome agricultural condition in Wisconsin.

"This impression corroborates what the entire country has come to understand, through published statements and personal reports, that the state of Wisconsin has suffered less depression during the past three years than any other agricultural section in the United States."

TUBERCULOSIS INFECTION

A report of the U. S. Department of Agriculture states that nearly nine-tenths of the herds of cattle in this country contain no tuberculous animals. The percentage of infection varies greatly. In ten states it exceeds 25%, or one herd in four, and in eleven states the average infection is one herd in twenty. Another encouraging thing about tuberculosis eradication is, that when tuberculin testing is properly done, a larger part of the infected animals can be eliminated upon the first test. Records on nearly 25,000 herds show that 15,000 of that number were entirely free from tuberculosis on the first tuberculin test. The second test cleaned up 4,600 additional herds, or more than four-fifths of the herds tested were free from tuberculosis on two tests made about six months apart.

As the Department of Agriculture says, when the disease is extremely deepseated, more tests are required and in some instances even eight tests have been made before all infected animals were removed, but such instances are very rare. All that is needed to free our herds from tubercular infection is careful and well informed men to apply the test and then have the owner eliminate infected animals and exercise care in keeping his premises thoroughly clean and see that his healthy animals do not have an opportunity to come in contact with diseased ones.

THE BREEDER'S OPPORTUNITY

College and club boys' judging teams which will compete at various live stock shows this fall are making preliminary trips to prominent breeders for the purpose of becoming informed on what constitutes the best breed type. Reports have come to us that few breeders show interest in this character of work and have even gone so far as not to welcome the boys who desire this information. It seems to us such breeders are not utilizing an opportunity to popularize their breed or their own herds. When a person becomes a breeder of live stock, he must not only seek information on how to mate animals, but he must also train himself to be a good business man.

A man who simply mates animals and never lets anyone know the kind of live stock he has and shows a disposition against receiving visitors is not likely to meet with the highest success. A breeder must be a good business man. To this end he must embrace every opportunity to present his breed and his cattle favorably to the public. Most breeders, however, feel complimented when visitors come and especially when young men desire to use their animals in training themselves to be capable judges. It is good advertising to have these young men visit prominent breeders and all wise breeders know this and will inconvenience themselves to assist the boys in having an opportunity to pass upon their best as well as their poorest animals.

WEALTH AND CULTURE

We too frequently narrow our conception as to what constitutes wealth and culture. We should not measure wealth only in terms of corn, milk, land, and money; or culture by luxurious surroundings. They are much broader than this. Professor Robertson of Canada, one of the outstanding leaders in agriculture, a few years ago said:

"Agriculture may be said to include not only the cultivation of the land but the culture of the people who live on land. Wealth may be defined as anything that ministers to the wants and happiness of man, and the ownership and possession of which can be transferred from one person to another. Its original sources are the sun, soil, air, water, plants, animals, and labor. It is the task of the agriculturist to so manage these agents and agencies as to obtain the largest and best service for himself and his fellows from them.

"His effort must be directed by intelligent purpose, if he is to prove successful in his vocation. The outcome of true culture is the exercise of intelligent purpose in the activities of life; and that, in his occupation, stamps the good farmer as a man of real culture. It is a false and mischievous notion which imagines that culture consists in or is shown by a life of idleness in the midst of beautiful and luxurious surroundings. That is not culture; it is corrosion of the fibres of muscular, mental, and moral life."

ORGANIZATION POWERFUL FORCE

Frank O. Lowden, president of the Holstein-Friesian Association of America, is a staunch friend of farm organizations. He has devoted himself to studying various co-operative enterprises not only in this country but in foreign lands. He has found that when farmers are properly organized they are in position to render themselves a better service than when they work individually. In a recent address he stated:

"Organization is a most powerful factor in human progress. The economist as long ago as Adam Smith found in organization the key to industrial growth. Organization means the difference between the mob and a highly organized progressive society. The psychologists tell us that in an unorganized mass of men the primal instincts have full sway. Therefore, he who appeals most strongly to the passions of the unorganized mass influences them most. Reason, justice, mercy, all the finer qualities which civilization has evolved, are swept aside by the rising tide of the primitive passions of men. The voice of the scholar, of the humanitarian, of the moralist, and of the preacher is drowned. Now, if we take this same unorganized mass and shall succeed in giving it a thorough organization, the wisest and best men within it naturally rise to positions of leadership. The result is that its conduct, instead of inclining to the plane of the lowest, will tend to rise to the level of the highest.

"Through organization only does progress come."

CO-OPERATION IN DENMARK

Co-operation among the dairy farmers in Denmark is many times referred to by leaders in co-operative effort in this country and not infrequently do they misrepresent the Danish farmers' co-operative efforts. The Danish farmer has spent more energy, effort, and time in co-operative production than he has in co-operative marketing and every student of co-operative marketing knows this is the first step to successful co-operative marketing.

The Danes have been wise in co-operating in the production of a uniform quality of butter and of the kind of bacon the market demands, for quality and uniformity of farm products are fundamental to any co-operative marketing concern. While the Danish farmer has been very successful in co-operation in reference to production, he has not equaled the American farmer in co-operative marketing and in reference to this, Dr. Tait Butler, who lately visited Denmark and editor of The Progressive Farmer, in a recent article says:

"Co-operative marketing in Denmark has been much exaggerated by our American writers on co-operation. They have nothing to compare, in my opinion, with our California fruit and egg marketing or even with our tobacco and cotton co-operative marketing. What they have done better than any other country is co-operative production. They have done wonders in co-operating to produce fresh, marketable farm products, bacon, eggs, butter, etc., but to my utter astonishment these products are largely sold in competition by individual creameries and bacon factories."

We have many times called attention to this and have pointed out that there are several co-operative marketing associations exporting butter from Denmark.

We should make use of what has been accomplished in Denmark and what has not been accomplished there in co-operative effort as an example and as an encouragement. We should follow their example of developing more co-operation in production; that is, in producing uniform high quality products. The encouragement we should gather from them is that while Denmark is one-third the size of Wisconsin, the Danes have not been able to establish a co-operative marketing company that takes care of all their products. Further, while we at times grow discouraged over our progress in co-operative marketing, yet in a country many, many times larger than Denmark, with far greater diversification, and with different classes of people to satisfy, we have made even greater progress than has Denmark in marketing farm products co-operatively.

Green, Cured, and Stored Weight of Hay

What is the difference in weight of bluegrass, mammoth clover, and alfalfa when first cut, when well cured, and when it has been stored in the mow three to six months?

Brighton, Mich. D. F. A.

It is rather difficult to estimate the cured weight of grass from its green weight, owing to the many variable factors involved. At certain seasons and in some years, clover, for instance, will carry a higher percentage of moisture than at others. The amount of moisture that evaporates will also be dependent upon weather conditions, so any estimate may be generally wide of the amount. However, we give below an estimate by Professor Boss of Minnesota of the moisture content of the green grasses mentioned at the three periods:

	Moisture content		
	When cut	When hauled	After 6 mos.
Bluegrass	65%	30%	13%
Mammoth clover	80%	35%	18%
Alfalfa	80%	35%	15%

Using the above figures the approximate weights of each ton of the grasses mentioned, at the time indicated, would be as follows:

	Weight when cut	Weight when hauled	Weight after 6 mos.
	lbs.	lbs.	lbs.
Bluegrass	2000	1000	804
Mammoth clover	2000	615	488
Alfalfa	2000	615	470

The above estimates are based on a relatively few observations and too much importance should not be attached to them. However, insofar as average conditions may be considered, these estimates are about as accurate as may be expected.

Sodium Arsenate for Weeds

In your issue of July 25 there is an article by S. R. Winters on weeds. Among other things he mentions a spray for killing dodder which is made by the U S. Smelting, Refining, and Mining Co. I would like to have some one tell me the mode of spraying, i. e., with what kind of spray, how much to use, etc.

Jackson, Tenn. R. A. H.

The chemical spray recommended by Mr. Winters is known as "Usseo". This is a commercial herbicide or plant killer of which arsenic constitutes the principal ingredient. The success of this spray will depend to a very large extent upon the per cent of sodium arsenate which it contains. Another chemical closely resembling sodium arsenate, sodium arsenite, is a more effective herbicide. Sodium arsenite has been recommended for destruction of weeds for many years. It can be purchased from druggists or from wholesale chemists. It is a compound of white arsenic and soda. If it is not available commercially it can be made up at home by anyone who desires to do so, after the following formula: caustic soda 2 lbs., or high grade concentrated lye, 3 lbs.; white arsenic (arsenic trioxide) 4 lbs. To it should be added enough water to make one gallon. The caustic soda used should be in the granulated form. This material usually comes in 5-lb. cans and if not obtainable from the chemist may be obtained from dealers in laundry supplies. If caustic soda does not happen to be available, the concentrated lye can usually be obtained from any grocer. The caustic soda and the arsenate should be mixed thoroughly in a wooden or granite receptacle. Water must be added slowly and the mixture stirred vigorously as it is apt to boil freely when the mixing takes place. Sometimes the arsenic dissolves rather slowly and it is necessary to heat the material until all of the arsenic goes into solution.

When ready for use this gallon of stock solution should be diluted to 50 gallons by the addition of water. If smaller amounts are needed they can be made up in the same proportion. The stock solution will remain in the liquid condition for a week but after this is apt to crystallize and if it is needed for a longer period should be stored in an air tight container so as to prevent crystallization. The sodium arsenite spray should be applied with a pressure sprayer equipped with a nozzle to throw a very fine mist-like spray. The success of the spray depends on bringing the herbicide into direct contact with practically all parts of the plant

The solution may be applied with a sprinkling can with fine holes but is not so effective unless applied in heavier quantities so as to be certain to reach all the plants. One gallon of the solution will spray approximately 75 square feet of space, or the 50 gallons made by using the entire gallon of stock solution will spray approximately 3,600 square feet. Best results in the application of this solution can be obtained on a somewhat cloudy day when the air contains considerable moisture but when rain is not predicted within 24 hours. If rain falls within that time it may be necessary to spray again. It must be remembered that sodium arsenite is a deadly poison and that it ought not be used where there is any possibility that live stock may feed upon the herbage that has been sprayed. Owing to the somewhat salty flavor which the sodium arsenite bears, stock are attracted to it. Extreme care should be taken to see that all forms of animal life are kept from coming into contact with it.

Wis. College of Agriculture. A. L. STONE.

Grain to Feed with Alfalfa and Silage

Kindly suggest a balanced ration, using any or all of the following feeds, to be fed with alfalfa hay and corn silage: Ground oats, ground corn and cob meal, hominy, gluten, oil meal, and bran. Will hominy replace corn and cob meal in the ration? I have a herd of grade and pure-bred Holsteins.

Burlington, Wis. C. G. K.

It would be rather difficult to make a poor ration when there is a good supply of alfalfa hay and corn silage. These two feeds supplement each other very well and good records are made when cows receive no grain with them, but this is not a practice which we would advocate under average conditions, for in most instances it pays to feed grain with silage and alfalfa.

Since the prices of the feeds were not stated, we are giving no consideration to this in suggesting the following mixture to feed with silage and alfalfa: Ground corn and cob meal, 300 lbs.; hominy, 100 lbs.; ground oats, 100 lbs.; and bran, 100 lbs. If it is desired to have the cows do exceptionally well, then we would suggest the addition to the mixture of 50 lbs. gluten feed and 50 lbs. oil meal. Feed one pound of this mixture for each 3½ lbs. of average testing milk produced. Some cows will require perhaps a little more than this. On the whole, however, it would be our suggestion to feed a little less. It will be found that some cows will make the most profitable returns when they are fed at the rate of one pound for each 4 lbs. of milk produced. Besides the meal, let each cow have all the alfalfa hay she cares to consume and about 30 lbs. of corn silage per day.

Hominy will replace corn and cob meal. It is a richer feed because the cobs are removed. The composition and feeding value of hominy is very nearly the same as that of ground corn.

Stirred Curd Cheese Not Kind to Build Industry

HOARD'S DAIRYMAN:—A great many cheesemakers in order to get their work done as soon as possible, make hand stirred cheese. If they would only follow such cheese from the time it leaves their hands until it reaches the consumer they would not make another pound of hand stirred cheese. From the commercial standpoint the making of hand stirred cheese should be discouraged because it lacks the smooth, silky body which good cheese should have and is doing more than any other factor to injure the consumption of cheese.

If we are going to increase the consumption of cheese we must give the housewife a cheese that will not go slushy and grainey in the preparing of cheese dishes as hand stirred cheese does. For this is causing the housewife to become discouraged with cheese recipes and disgusted with cheese, with the result that consumption does not increase.

It is true that some of our hand stirred varieties have merit, but the great bulk of hand stirred cheese is made by makers that desire to get through early and as a result the cheese market is ruined by this product. The loaf cheese people have conducted experiments on the curing of hand stirred cheese and their findings were that the cheese has a tendency to cure with a bitter flavor due to the high moisture present. They buy a little of the hand stirred varieties but it is most all used for resale as bulk cheese.

The great majority of our hand stirred varieties is made without starter and this is the worst kind of cheese as it will spoil before it cures. The milk is nearly sweet when set, and there is not a great deal of acid present; the maker in his hurry to be through does not develop the acid in the whey as he should with the resulting high moisture cheese. The separation of the whey from the curd goes on faster if there is a moderate amount of acid in the whey and curd, and also results in a better cheese. It is known that Wisconsin has a moisture law of 38 per cent but cheese testing as high as 40 per cent are not hard to find.

In the making of cheese, about half an hour after cutting a curd the rate of whey expulsion becomes quite slow at a temperature of 86 degrees, so in order to hasten the expulsion of whey, the vat is heated higher to a temperature of 100 degrees. Conversely at any time we wish to stop the moisture separation, this can be done by cooling the curd down to 80 degrees or below. The simplest and quickest way to do this is to cover the curd with cold water. Cold water may be applied to a granular curd as in the Colby process and to a milled curd as in the washed curd process. As the temperature goes down the curd stops releasing moisture and when cold enough actually begins to absorb moisture again. That is, the proportion of moisture which a curd can hold depends on the temperature to a considerable extent. If the cold water is left in contact with the curd long enough a very inferior soft, wet product results, called soaked curd in New York. If the cold water is used in such small proportion that the curd is not cooled too far and drained off very quickly, so that the curd has little chance to soak up extra moisture, the product is called a wash curd.

Other effects of this cold washing are a milder flavor such that some people pronounce it flat, and less tendency to gas holes in the cheese due to the cooling of the curd. This cooling system might be used to some extent whenever a curd shows gas in the vat.

Illinois. C. R. BARKER.

Value of New Feed for Dairy Cows Tested

Extensive tests of the values of various new feeds for dairy cows have been made by the United States Department of Agriculture at its experiment farm, Beltsville, Md., and the results are now made available generally in Department Bulletin 1272, just published. Details of the work were carefully planned to insure a fair test. In every case the feed tried out was compared with some standard feed as similar in composition as could be obtained, and one that might be replaced by the new feed if found satisfactory.

Fish meal, though not so palatable as cottonseed meal, was found to be worth, pound for pound, 20 to 25 per cent more than prime cottonseed meal. The cows would eat all that was offered, and no bad effects on the physical condition of the cows were noted. The flavor of the milk apparently was not affected in any way either by exposing the milk to the odor of fish meal or by feeding the cows 4 pounds of the fish meal before milking.

Peanut feed containing 27.25 per cent crude protein possesses a nutritive value not exceeding 74 per cent of prime cottonseed meal. It is thought that the protein content affords a fairly reliable guide in estimating the value of this feed in comparison with cottonseed meal.

Potato meal is worth not more than 78 per cent as much as corn meal.

The maximum value that can be assigned to velvet bean meal is 65 per cent that of cottonseed meal.

Sweet potato meal appears to be almost as valuable as corn meal.

Potato silage and corn silage were found to possess about the same feeding value.

Apple-pectin pulp compared with dried beet pulp was found to be less palatable and less efficient as a feed.

Hydrolyzed sawdust is unpalatable, contains but little nutriment, and can be fed only in small quantities. The maximum value that can be assigned to the sawdust is 14.5 per cent of that of corn meal.

Supplementing with cane molasses a ration that is already suitable is not economical. Compared with an equal value of hominy feed the molasses appears slightly less valuable. Molasses renders feeds of poor quality more palatable and induces a greater consumption of nutrients, a matter of importance in feeding exceptionally high producing cows.

Details of the experiments are contained in the bulletin, which may be had free, as long as the supply lasts, upon request of the United States Department of Agriculture, Washington, D. C.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

A Serum Needed

HOARD'S DAIRYMAN:—We are a strange people. It would seem in these times of agricultural distress that the so-called leaders have completely lost their heads. There seems to be no place for the man who advocates right principles and practices in agriculture and who believes the farmer must save himself and that agriculture must be built upon a basis similar to that which has made other industries successful. We run to Congress and ask the enactment of laws which will suppress monopolies; then we ask this same body to pass a law showing how these monopoly laws can be evaded.

A certain group of men have gone to Congress and asked for millions of dollars to open new tracts of land, and another group has gone to the same body, asking it to enact laws that will take care of our surplus agricultural products. We have the spirit of putting something across rather than laying plans which will build constructively and permanently.

Certain men think that they must do something in order to bring favorable comment from those whom they would serve. There seems to be a lack of understanding and genuine thinking. It's step on the gas, whoop her up, and put her across regardless of results. Thank goodness for the thinking farmers found everywhere who see the travesty of the present situation. They are the ones who will save agriculture, for in time the present disease for doing something will run its course. If it doesn't, perhaps there will be some department of government established for manufacturing a serum that will stop the spread of this contagion.

Minnesota JAMES BRADLEY.

Overproduction

HOARD'S DAIRYMAN:—The farmer is told by those who want to take care of the legislation for him that the old man, supply and demand, handles the job of price fixing and that no legislature, state or national, can wrest it from his grip. He is also told by those who want to spend millions more to increase production that such increase will not hurt the market of present producers. Even Senator Jones is reported as bewailing the fact that so many ranchers, who are losing their farms because of overproduction, should be appealing to congress for a moratorium, extension of time on irrigation charges, thus making it hard for the senator to convince congress that millions of dollars more should be appropriated to irrigate more land, to greatly increase the ruinous surplus of farm crops.

Again the farmer is reminded over and over that his ills are the result of a diseased imagination, that he is not really hard up, but is like a man who is told by everyone he meets that he is looking awfully bad, that he ought to put himself in a good doctor's care at once or he will surely not last long. These would-be comforters of the farmers hope to convince them that their distress is wholly imaginary and has no basis in fact. Mortgage companies that are unable to collect interest on farm loans, county treasurers that are selling more farms for taxes than was ever known before, the many banks that have closed because unable to collect loans made to farmers, abandoned farms and farms for sale at less than half former prices and no buyers at that, do not make it possible for the farmers' would-be guardians to see anything wrong with the farming business.

More than 75% of the fruit raised west of the Rocky Mountains must be shipped east of the mountains to find consumers. The freight charge on this is about $300 per acre. Almost everything that the West produces is in excess of the demand of the western consumer. The farmer on the Pacific coast must take the price for his crop that is paid in Mississippi valley and Atlantic coast markets less the cost of transportation there.

According to Professor Spillman, the Secretary of Agriculture, and the Secretary of Interior, the outstanding trouble with farming is that too much is produced. According to Senator Jones' economies, as reported in the papers, if he had an automobile factory and found that he was making more machines than he could sell at a profit he would mortgage his plant, and double its size and double the output to make the business profitable.

Washington. S. J. HARRISON.

Remedy for Farmers' Problem

HOARD'S DAIRYMAN:—We are still in search for a practical remedy for the farmers' problem and in my opinion any suggestions which may be published at this time are very much in order. In formulating any remedy for the present disparity of prices between farm produce and other articles of commerce, the following conditions must be reconciled before the solution can be adopted:

1. We are an export nation. It should not be necessary to argue this point but there are those who still think of reduced production as a possible remedy. Let me call attention to the many million acres of arable land suitable for cereal production which are still to be reclaimed in the arid West. Let me call attention to the recent railroad activities of the late James Hill in bringing these acres tributary to Pacific Coast ports on a water grade. Let me call attention to the vast sums already expended by our Dept. of Commerce and Labor on the Columbia river jetty in order that deep sea going vessels could get up to the wharves at the terminals of these railroads.

2. We are a nation irrevocably committed to paternalism. Displeasing as this term may be to the present administration, our national policy since 1896 has been one of high protection for our manufacturers. I may mention the Payne—Aldrich textile schedule under which American-made dress goods was sold in the U. S. under a 60% *ad valorem* import duty and that surpluses could be exported and sold in competition with world prices in free trade countries.

3. Well known farm machinery made in the U. S. can be purchased cheaper in Europe than at home. Our railroads have been guaranteed a profit and our labor unions have received national recognition and their right to set a price has been nationally indorsed. We are therefore a nation committed to paternalism.

4. Our foreign market is demoralized. Our foreign policy must be directed toward this question with the least possible delay.

5. We are living on the highest standard in the world.

Any solution to the farmers' problem must be reconciled to these conditions.

There are those who think we can well allow the disparity in prices to continue long enough to weed out enough producers so that the remainder will get a profit. The supporters of this view are invarably located in the older sections where the reservoir of resource is large enough to stand the strain until frontier bankruptcies bring down production to the domestic requirements. This is a narrow viewpoint and does not take in the conditions very well.

We cannot expect the farmers to organize from the bottom up in time to cope with the present emergency.

In my opinion, the government should undertake to organize the farmers from the top down the same as the farm bureau was organized and use the present agricultural department and county agents to determine the cost of production.

Minnesota. HOWARD KIMBLE.

Wants These Columns Continued

HOARD'S DAIRYMAN:—I read with considerable interest the letter of P. B. Crane of New York in the July 4th issue and with twenty-five years of dairying behind me I feel he has put the solution of the dairyman's problem in two very terse paragraphs.

Three years of cow testing work has convinced me that even more than one-third of all so-called dairy cows should go to the shambles. Another point, while only about 25 per cent of the cattle are pure-bred, I believe only about one-fourth of them should be raised for breeding purposes; then perhaps they would be good enough to raise the general standards.

Time after time I have bulls purchased at considerable expense, many times with good pedigrees, and they were actually a disgrace to the breed and to the owners. Only a few weeks ago I saw a bull that came from a prominent breeder that, considered from a type standpoint, should never be used for he can easily undo the work of years.

I hear a great many favorable comments on the O. B. B. page and trust it may be continued.

Michigan. S. P. SEXTON.

Will Farmers Protect Their Children?

HOARD'S DAIRYMAN:—A few days ago the writer saw an editorial in the Kansas City Star entitled, "Arkansas Protects Her Children". The editorial was praising Arkansas for being the first state to ratify the recently proposed child labor amendment, and the action of the legislature was being commended.

Things are not always what they seem. Instead of the act of the Arkansas legislature being commended, it should be condemned in the most scathing terms possible. Arkansas did not protect her children; she betrayed her children. Arkansas is an agricultural state. The proposed amendment gives Congress the power to regulate and prohibit the labor of children under eighteen years old. This, however, is to apply largely to city children. It is a fine thing for children on the farm to work—it develops them; but for city children—it is inhuman. We should pass another foolish constitutional amendment to prevent child labor—in the city. If this foolish amendment becomes part of the supreme law of the land, city labor of all kinds, already overpaid, from factory managers to day laborers, will demand higher wages to cover the increased cost of bringing up a family, or will limit still further the size of the family.

The main idea back of the eight-hour day, the child labor laws, laws to regulate industry, and various other foolish laws advocated by union labor, women's organizations, crackbrained sentimentalists, and demagogic politicians is—there should be one standard of living for the cities and towns; and another, and much lower standard, for the country. Such a position is untenable and will wreck this nation. The labor of women and children figures largely in the production of all farm products, especially fruit, poultry, and dairy products. This labor of women and children makes all kinds of farm products cheap to the people of the cities and towns, and I hear no objection to it. But, when the labor of women and children goes into the production of something made in the city—a fact that would reduce the price of something that the farmer buys—I hear a constitutional amendment proposed to stop it. The legislature of any rural state that ratifies this amendment betrays its children; the legislature of any state, rural or urban, which ratifies this amendment betrays the nation. Farmers of the United States, if you want to protect your children, tell your representative to vote "No" on this amendment.

Missouri. F. W. HANCOCK.

Trading Business

HOARD'S DAIRYMAN:—The firm by whom I am employed subscribes for your good publication and I read it with much interest.

In your issue of July 4th I note the suggestion of Helen S. K. Willcox under the head of "Friendly Talks for Farm Folks" that farmers and city men trade jobs for a year, so that each might know something of the other's tribulations. I fancy that the foremost trial of each would be the knowledge that at the year's end he must take back his own business and try to repair the wreckage that the other had wrought. I can picture only one thing that would surpass the dismay of a city man at turning over his business for a year to the average farmer, and that is the absolute consternation of a good farmer at turning over his well ordered farm for a year to the average business man.

I farmed for over 20 years and have been in town for the last 4, and my guess is that Mrs. (or is it Miss?) Willcox will not get an enthusiastic response to her suggestion.

Montana. F. L. WATERS.

Against Tariff on Butter

HOARD'S DAIRYMAN:—You Wisconsin dairymen are writing your congressmen for an increase on butter tariff and I am writing my congressman that as Kansas has 48,000 farms that are cowless and considering that Wisconsin dairymen are unanimously against any legislation in behalf of the Kansas farmers and wheat growers, I am very decidedly against any tariff increase on any article and that to raise the tariff on butter would be unfair class legislation presumed to raise the price and penalize the consumer. There are two sides to all questions. The best thing Wisconsin can do is to keep us out of the dairy business.

Kansas. E. E. HAZEN.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, D. C., AUG. 12—Dr. George F. Warren of Cornell University, author of the "Warren Formula", the first and best known method of estimating costs of milk production, will be the cost expert sent by the U. S. Tariff Commission to Denmark to study and report on the cost of butter production in that country. He is one of the commission of four which has been selected to go to that country in the butter tariff inquiry.

The others will be George P. Comer, chief investigator of the U. S. Tariff Commission; Professor Juve of the U. S. Department of Agriculture, already assigned to the Tariff Commission work, and an accountant whose name has not been announced.

Figures made public this week by the U. S. Department of Commerce show that during the first six months of 1924 the imports of butter into the United States were almost double the imports for the same period in 1923. The amount imported during the January to July period, 1924, totalled 16,965,773 pounds, valued at $6,173,647, as compared with 11,241,196 pounds in January to July, 1923, valued at $3,940,732.

Denmark furnished almost half of our imports in 1923, but Argentina increased its imports into this country from 793,314 pounds for the January to July period in 1923, to 3,005,177 pounds in the same period, 1924. New Zealand shipped about the same amount of butter to this country for the two periods; that is, about three and a half million pounds the first half of 1923, and three and three-quarter million pounds the first half of 1924.

One of the points at issue relative to the fairness of the application of the flexible tariff act to the butter industry is the fact that the imports from Argentina and New Zealand are likely to increase rapidly whereas there are certain reasons for believing Danish imports may not increase, and the general belief is that southern production costs, especially those in Argentina, are much lower than Danish costs, making that competition far more difficult for American producers to meet than the Danish competition upon which the tariff report will be based.

⚜

Dr. C. W. Larson of the Dairy Bureau and Ernest Kelley, the market milk specialist of the Bureau, will represent the Bureau at the coming meeting of the National Association of Dairy, Drug, and Food Officials at Chattanooga, Tenn.

⚜

St. Paul and Minneapolis have a larger part of their milk supply brought into the city by motor truck than any other cities in the United States, in spite of the snow and hard winters. Milwaukee stands next with Cincinnati a close third and Indianapolis next. The percentages for these four cities are respectively 98, 97 plus, 97, and 91.

These results are shown in a very searching inquiry which the Bureau of Public Roads has made into the methods, costs, and results of milk hauling by truck for city milk supply. The survey is in the current issue of the bulletin of the Bureau. More trucks are used in Milwaukee than in any other city, 125 in all, but they are smaller trucks than in some other cities, and traverse comparatively shorter routes. The Twin Cities supply uses 122 trucks. Detroit has the largest fleet of glass lined tank trucks and is the only city to have this form of transportation largely used.

⚜

J. M. Kemper has been appointed administrative assistant to Dr. C. W. Larson, chief of the Dairy Bureau. Mr. Kemper was connected with the office of the fiscal supervisor of the Department before receiving this promotion. His duties will include especially the listing and control of the personal and real property of the Dairy Bureau, which starts out as a large business administration, in addition to its scientific and investigational work. The property which comes into Mr. Kemper's charge, as Dr. Larson's assistant, includes the laboratories as well as all office equipment in Washington, the farm and station at Beltsville, the laboratories and cold storage plant in Washington, the Grove City Creamery and manufacturing plant, the western office at Salt Lake City, and the equipment at the various co-operative experiments going on.

⚜

E. M. Bailey, chairman of the executive committee of the American Dairy Federation, has made arrangements to have the members of the executive committee of the federation discuss the ice cream standard, but will also take up a number of other matters of interest.

AYRSHIRE COW, VICTOR'S ROSE, AND HER SIXTEENTH CALF

Bred and owned by the Massachusetts Agricultural College. She dropped her first calf May 19, 1908, and has had one each succeeding year, giving birth to her sixteenth, which is shown here in the picture, on June 25, 1924. She is the mother of eight daughters and eight sons, the last four being females. Six of the bull calves have gone into farmers' herds as herd sires. One daughter, Victor's Primrose, is the mother of two sets of twins and has an A. R. O. record of 11,030 lbs. milk and 488.9 lbs. fat. A granddaughter, Victor's Beauty Rose, has an A. R. O. record of 16,714 lbs. milk and 716.07 lbs. fat. Victor's Rose as well as being a regular breeder has been a consistent producer.

Your Blizzard Ensilage Cutter dealer---

has a real proposition for you!

He has the right price and the right terms on the machine that is exactly what you want for power you have, the silos you want to fill, and the number of men and teams you'll have available for the filling.

Three models for use with tractors

Model R-211 pictured with light tractor power cuts and elevates 6 to 9 tons per hour. It has the Dick Paddle Roll Self-Feed. Four other models operating on 3½ to 18 H. P. give capacity of 4 to 35 tons per hour. *Write for catalog* and nearest dealer's name, if you don't know him.

The Jos. Dick Mfg. Co., Box 500, Canton, Ohio

Why Blizzards Excel

Lightest running. Do most work per H. P. Safest to operate. Longest lasting. Do finest work.

Write for Catalog

Get the real facts on capacities, power needed, work done by Blizzards.

Built Right - Priced Right

The Papec is built on principles proved correct through more than twenty years' use. It is positively guaranteed to cut and elevate more silage with the same power than any other blower cutter. Yet the Papec is priced relatively low. Figure the light power, low cost of upkeep, freedom from breakdowns and delays and its long life and you'll agree that the Papec is by far the most economical Cutter you can buy. There's a size that will get results with your power.

Throws And Blows — Saves One Man

"Our L-16 Papec Cutter saved its price the first year in shortening silage-cutting time," writes the Virginia Hot Springs Co. "We have used the Cutter two years, filling four silos with about 800 tons, using Fordson Tractor."

Every silo user should have a copy of our new catalog and U. S. Gov't Bulletin "Making and Feeding of Silage." Our book shows how a Papec often pays for itself the first season. Both are free to users of silos—write for them.

PAPEC MACHINE COMPANY

116 Main Street Shortsville, N. Y.

POWER THAT PAYS

Fuller & Johnson Model "N" Gasoline Engines pay big returns on the investment. Why? Because they operate for so many years at such a small cost for fuel and upkeep. Each engine is a complete power plant, easy to start, and so mechanically perfect that many sold 10 to 20 years ago, are still chugging away putting money into the pockets of their owners at every turn of the flywheels.

It costs you less to use the best. Write today for *free* booklet 21A. It tells all about power that pays.

A Child's Questions

"I had six honest serving men,
They taught me all I knew;
Their names are What, and Why, and When,
And How, and Where, and Who."
—KIPLING.

I often think of this verse when I see parents who evade their children's questions. It is hard for us now to go back and imagine how it must feel to be a small child, knowing nothing but having an enormous curiosity almost from birth. Long before babies can speak they show this curiosity by looking at and reaching after things and as soon as they have any words at their command they try to build up for themselves a stock of information such as we older people have, by asking questions.

Most of these questions are of the type of the six honest serving men that Kipling writes about—just single words—because a child does not know how to ask questions with the intelligence that comes of experience. He hopes that simply by asking, "Why?", for instance, you will elaborate and explain the thing he wants to know.

A child's mental machinery is determined to a certain extent before he is born, provided he is to be born of certain parents. There is only one way that people can take to raise the grade of their possible children and that is to think of it before marriage and choose a mate with that in mind. Once a certain man is married to a certain woman, there is nothing that can be done to change the mental inheritance of their children except as accidents play a part. This does not mean that all their children will be alike; they will not, because some will inherit largely from one ancestor and some from another but no child has any more to draw from mentally than the sum total of his ancestors' equipment.

All this is the opinion of our best thinkers and no amount of reading of good books, for instance, by an expectant mother will make her child one whit more erudite; its only effect is to improve the mother so that she can better train the child after birth.

But if the heredity of our children is fixed so soon as we are married, their environment is not. That is where much damage done by an ill-considered match can be repaired and that gets me back to my starting point. We often think of a child's environment as just the house in which he lives or other tangible surroundings. Environment, on the contrary, is composed of all the small things that encompass him and affect him for good or bad. His parents' answers to his questions form part of his environment and do much toward shaping his later life.

Happy is the child whose parents give him sensible, truthful answers. The idea of being truthful with children naturally prompts one to wonder what to say when the inevitable day comes around that they ask about the origin of life—their own or other children's. That is surely one of the most difficult times in the rearing of a child but even that question must be met with truth, for sooner or later a lie will be found out and the parents regarded acordingly for it.

There are any number of helpful, true stories for the parent who wants to meet this question honestly. A child who is on frank and open terms with his parents will usually ask such questions long before he is capable of understanding a detailed answer. If he is then told the story of the propagation of flowers by pollen and of the simpler forms of animal life leading up to the higher he will have had a true answer that will, in practically all cases, turn his curiosity aside.

Without making it appear morbid, a parent should by all means try to see that this subject is not discussed with other children. As a farm child I attended both town and country schools and the amount of naughty talk indulged in by country children was shockingly worse than it was in town. This, I believe, is still the case though I have no check on it. A farm child's observance of animals has something to do with this and also the fact that there is less variety of interest for him.

Innocence is beautiful but hard to attain in these complex days and I am inclined to think that an ounce of decent knowledge is worth a pound of innocence as a safeguard. Sex is a strong factor in the life of a growing child but it is an entirely normal one and should always be treated in a frank, normal way.

This is, however, only one of the thousands of things that rise to the surface of a child's mind in the form of questions. The richer he becomes in knowledge of simple historical facts, stories of Nature, and the like, the less room will his mind have for unwholesome thinking.

This places a great burden on parents, of course, but children should never be brought into the world if it is not the intention of the parents to make the rearing of them their chief business. Children simply cannot be made a successful side issue; if at times they seem to turn out well under neglect, think how much better they might have been with care.

Let me tell you about the child of a family where I visited lately. The mother thought that a child's every question should be answered seriously and the conversation at dinner ran, for the most part, something like this:

"Mama, what is in that dish?"

"Those are potatoes, darling."

"Mama, what are the potatoes doing?"

"Nothing, dear, they are just in the dish.' A pause, then:

"Mama, what is in that dish?"

"Those are peas, darling."

"Mama, what are the peas doing?" and so on until it almost seemed like an endurance test.

It is not necessary to point a moral. Any intelligent parent knows an intelligent, reasonable question and answers accordingly. If any of you are interested in the stories I spoke of above on the origin of life, I shall be glad to furnish you the names of several.—LUCY THOMPSON.

Cost of Baker's Bread Compared to Home Baking

An investigation into comparative costs of the different processes connected with the transformation of wheat into bread, reveals the fact that in New York City where a loaf of bread costs eleven cents the baker gets seven. The proportion the baker gets is the same, no matter what the eventual cost of the baked loaf is.

The farmer who raises the wheat and the retailer who sells it get each one and a half cents for their share.

It is easy to see, then, how much wiser it is for the housekeeper to bake her bread herself, than it is to pay this tribute on each loaf to the bakers' union which has so increased wages that a tax is levied on every American citizen who eats baker's bread.

During the war, the wages paid were tremendously increased. The labor unions determined that they should be maintained at that figure, regardless of conditions modifying prices of other factories. It is, of course, a short-sighted policy on the part of the unions, as it curtails production of manufactured goods and leads to part time work and unemployment; but so far the unions have not seemed to realize the injustices they are perpetrating and there is no relief in sight.

Up to the present, the relief on the bread question is in the hands of the housewife, for she saves eight and a half cents out of every loaf, when bread is eleven cents, by baking it herself, and thus saving the toll levied by the baker and the retailer.

New York. ELLEN DE GRAFF.

Things Made From Milk

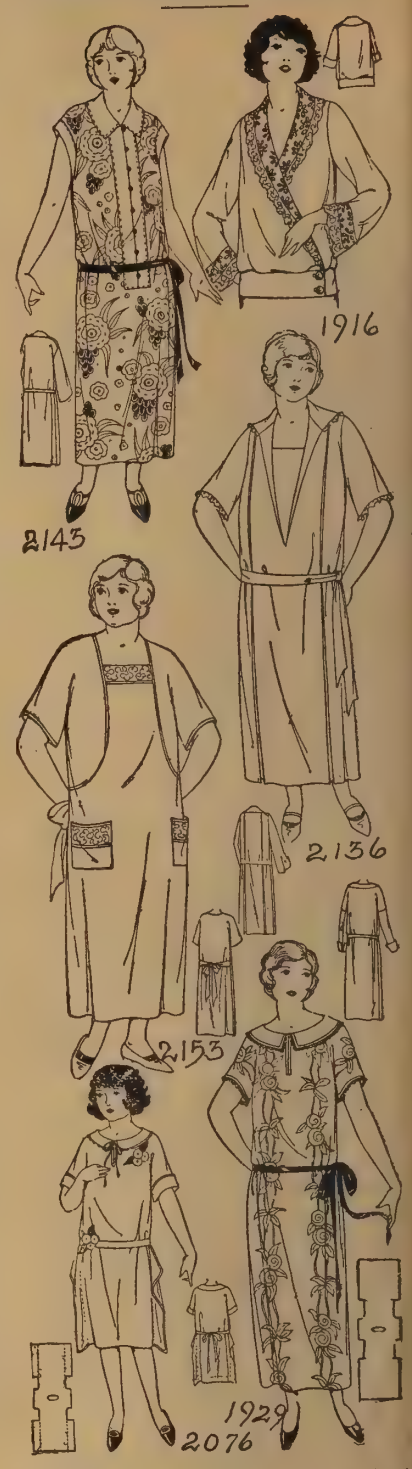
If you are going to have a dairy pep dinner in your community soon it would be interesting to have there a table full of things that are made from milk.

The casein of milk is very cohesive—gummy-like—and three per cent of it is used today in the manufacture of things that we would never guess had milk in them. These things include combs, fans, telephone receivers, earrings, cigarette holders, pipe stems, shoe polish, oil cloth, glue, photographic plates, beads, and the like. Probably your agricultural college could furnish you with a complete list and a display of such things would be bound to interest anyone who is interested in milk.—LUCY THOMPSON.

Hanging Up The Sheets

I have just made a discovery though it may be that the idea is not new to you. If you will hang up the sheets by the two hems they will straighten themselves out perfectly while drying. Then when you go to take them off the line there is no mussing of them while you are getting them off. Sheets that are dried smoothly can be put right back on the beds the same day and people who are not too fussy will never be the wiser.—LUCY THOMPSON.

Shocking



Mistress: What beautiful scallops you have on your pies, Mandy! How do you do it?

Cook: 'Deed, honey, dat ain't no trouble. I jes' uses my false teeth.—Everybody's Magazine.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Miscellaneous Fashions

No. 2143—One-Piece Summer Style. Cut in sizes 16 years, 36, 38, 40, and 42 inches bust measure. Size 36 requires 3 yards 36-inch material with ⅞ yard 24-inch contrasting.

No. 1916—Side-Closing Overblouse. Cut in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 requires 2¼ yards 40-inch material with 1 yard 20-inch embroidery and 2⅞ yards of lace.

No. 2153—Pretty Bungalow Dress. Cut in sizes 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 requires 3¼ yards 36-inch material with 3½ yards of binding.

No. 2136—Thinning Lines. Cut in sizes 36, 38,, 42, 42, 44, 46, and 48 inches bust measuse. Size 36 requires 3¾ yards 42-inch material.

No. 2076—One-Piece Dress for the Young Miss. See diagram for simple construction. Cut in sizes 6, 8, 10, 12, and 14 years. Size 8 requires 2¼ yards 40-inch material.

No. 1929—The accompanying diagram will convince you of the simple construction of this model. Cut in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 requires 2⅞ yards 36-inch material with ⅝ yard 16-inch contrasting and 3 yards of ribbon.

Fashion Magazine

From the front cover of our Spring and Summer Fashion Magazine right on through the book, you will see all of the styles which will be popular during the coming season. Styles for morning and afternoon wear as well as those needed for the more formal occasions. And cute styles for the kiddies. There are dressmaking lessons for the beginner, and charming styles which can be made in a couple of hours even by one who is a novice with the needle. Also photos of the most popular Broadway, New York, actresses. So settle your dress problems by sending 10c today for our new Fashion Magazine. You'll save dollars by doing so. Address Fashion Department, Hoard's Dairyman, Fort Atkinson.

Ever Failing or Never Failing Pasture

(Continued from first page)

Mr. Rehling said his cows laid down most of the day when on good sweet clover pasture.

Cow is Hardest Worked Animal on Farm

Cows are in reality the hardest worked animals on the farm. A horse at hard labor is not using more energy than a dairy cow does when she is producing an average flow of milk for a good cow. Horses on the farm work only six days in the week, and cost accounting records show that they work only three and one-third hours a day, on the average, for the 313 working days in the year; while good dairy cows work continuously, Sundays and holidays included, and for 320 days out of the 365 each year. Yet because she spends most of her time standing around or lying down, we think she is idle if not lazy, and do not realize the great need of saving all of her energy possible to put into milk production.

In 20 herds observed June 21, there were 576 cows standing and only 17 lying down, and 12 of these were in one herd on good pasture. In the 34 herds observed June 26 and 27, there were 688 cows standing and only 9 lying down.

The fact that cows are on their feet and walking a great deal of the day while on bluegrass pasture is not often considered by dairymen, but this waste of energy must surely have a detrimental effect on the flow of milk.

Working Cows Reduces the Milk Yield

In several European countries, notably Germany, cows are used for plowing in the fields and hauling on the road. On this farm in Germany, consisting of 10 acres, where I took the accompanying picture, all the draft work was done with cows. It was, of course, slow work and required two and a half days to plow an acre. By a system of changing off, in which four cows were used, each cow was required to walk only three and three-fourths miles a day. German farmers said that working cows even at a slow pace reduces the milk flow, even though the grain portion of the ration is increased decidedly.

So Does Excessive Foraging for Feed

We would not consider the working of dairy cows practical or economical in this country. Yet we are doing just as bad or worse in making our cows do useless work many hours of the day and night on short pasture. The German farmer is at least getting some return for the energy which his cows use in the plowing, while the energy wasted by cows in this country in the vain effort to try to get sufficient feed from short pasture is a dead loss. A cow must have a certain amount of energy for making milk; when part of that energy is used for something else—whether for plowing or ranging and grubbing for bluegrass—it reduces her milk flow. This reduction in milk from waste of energy would result even if she got enough feed, which she scarcely ever does in mid-summer on bluegrass pasture.

The Threefold Saving

So the role of sweet clover pasture as an agent of economy on the dairy farm is extraordinary—saving land; saving a great deal of human labor in the busiest work season; and saving the cow's energy for use in the manufacture of milk, thus removing a distinct and very common handicap that in itself alone makes the difference between a poor and a good producer. What other inexpensive crop or new method or machine could one introduce on the dairy farm that would effect one-half of this threefold saving?

The first two are among the greatest problems of the dairy farm and the last is a real handicap in itself and is inseparably interwoven with a much greater problem—that the cow is not getting enough feed for *full* production. To effect these three elements of economy in the highest degree, in the most natural way and at the least possible cost, is the royal province of sweet clover and its every day achievement for 180 days in the year. These demonstrated facts call upon every dairyman to thoroughly try out this paramount saver and helper in economic dairy farming.

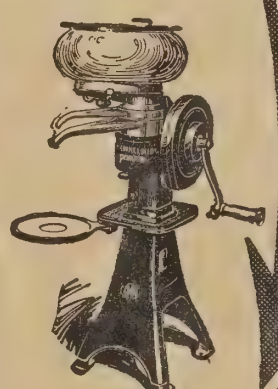
A garden is a beautiful book, writ by the fingers of God; every flower and every leaf is a letter.—DOUGLAS JERROLD.

The World's Easiest-Running Ball-Bearing Cream Separator Is Also the Easiest to Pay for

12 Full Months to Pay!

Maybe you haven't known that you could get a McCormick-Deering BALL-BEARING Primrose Cream Separator on such liberal terms. You can, and your local McCormick-Deering dealer backs up the sale with *personal service* that makes your purchase doubly worth while.

Ask for a Demonstration



The local dealer will set up the machine on your own farm, and show you how to use it. It will be turned over to you in completely satisfactory condition. You'll like it better every day.

Your Cream Checks Will Increase

and you'll find the McCormick-Deering BALL-BEARING Primrose just as easy to pay for as it is to operate.

Get in touch with the local dealer. Ask him to deliver a McCormick-Deering Primrose at once. He will give you 12 FULL MONTHS TO PAY for it. If you wish to receive our latest cream separator folder, fill out and mail the coupon today.

Manufactured and Guaranteed by the Largest Manufacturer of Dairy Farm Equipment.

INTERNATIONAL HARVESTER COMPANY OF AMERICA (Incorporated)
606 So. Michigan Ave. Chicago, Ill.

Farm Leases in North Dakota

The building of an equitable farm lease is not always an easy matter. There are many and various problems to be considered if justice to the soil, the owner, and the tenant is to be secured. To a proper solution of this problem Professor A. H. Benton has made a distinct contribution in Bulletin 171 of the North Dakota Agricultural College, "Cash and Share Renting of Farms".

Professor Benton discusses the reasons for farm leases and not only gives lease farms now in use in North Dakota but offers suggestions as to leases suitable to varying conditions. These will be of distinct aid to both tenants and landlords in coming to a definite understanding of their mutual and individual responsibilities and opportunities.

The bulletin contains a unique and interesting discussion of the relative contribution of the owner and tenant to the cost of the operation of the farm as shown by various cost accounting studies. According to the author's analysis, for instance, he finds that in the Red River Valley the total cost of raising an acre of corn and putting it into the silo amounts to $31.63. He estimates that of this the owner contributes $13.17 and the tenant contributes $18.46. In Central North Dakota the expense is $22.58 an acre, of which cost the tenant contributes $13.13. In both cases the tenant contributes nearly 60% of the total cost of producing silage. Like figures are shown for other crops and for the cost of maintaining live stock. The estimates on dairy cattle show that the cost of feeding and caring for a cow amounts to $111.10 a year, the tenant's cost being 60 per cent of this.

Bulletin 171 may be secured by writing the Experiment Station, Agricultural College, North Dakota.

Fort Scott, Kans., is actively interested in the National Dairy Exposition. A special train from Bourbon County alone, as well as cows and feeds, is being planned there.

DAIRY MARKET NEWS

July Prices at Wisconsin Condenseries

(Wisconsin Department of Markets)

The following table gives the prices paid for milk delivered at Wisconsin condenseries during the month of July:

City	Prices paid to producers per 100 lbs.	Test of basis of payment	Price paid for 3.5% milk
Belleville	$1.55	3.5	$1.55
Berlin	1.75	4.	1.53
Bloomer	1.75	4.	1.53
Brooklyn	2.50	3.5	2.50
Burlington	1.80	4.	1.57½

Butter Markets

(Report by U. S. Dept. of Agriculture)

Butter markets during week ending Aug. 9th were supported by shortage of best grades for which demand was good. Storage movement was very heavy despite large surplus over last year. Production is showing seasonal decrease, but still heavy. Hot weather is affecting quality.

The average wholesale prices on 92-score butter for the week ending Aug. 9, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending Aug. 9 1924	Aug. 2 1924	Aug. 9 1923
	Cts.	Cts.	Cts.
New York	37.8	37.9	43.5
Chicago	35.9	36.1	42.1
Philadelphia	38.5	38.8	44.3
Boston	37.6	38.2	43.5
San Francisco	39.6	38.3	44.1

The receipts of butter at these markets were 16,690,574 lbs. for the week as compared with 19,356,666 lbs. for last week and 12,629,872 lbs. a year ago.

July Condensed Milk

(U. S. Department of Agriculture)

Information regarding prices paid producers for 3.5% milk delivered at factories during July is based on reports made by condensed and evaporated milk firms.

Geographic sections	No. of factories	Price per cwt. Range	Ave.
New England	1	$1.67	$1.67
Middle Atlantic*	8	1.50—2.75	2.12
South Atlantic	1	2.32	2.32
E. No. Central	61	1.46—2.30	1.61
W. No. Central	3	1.58—1.65	1.61
North Western	13	1.44—1.64	1.58
South Western	9	1.53—1.75	1.60
United States	96	1.44—2.75	1.66

*Sixty-eight additional factories reported prices to be based in part on the current month's wholesale butter quotations. Twenty-three factories reported prices not determined, and nine reported plants closed.

The thirteen factories in the Middle Atlantic Section not included in the previous report averaged $1.67 per cwt. for 3.5% milk in the 201—250-mile freight zone from New York City.

Manufacturers' wholesale selling prices for sweetened condensed and unsweetened evaporated milk were as follows for June:

	Range	Ave.
Condensed, per case	$5.20— 6.70	$5.95
Condensed, per cwt.	6.90—11.50	9.99
Evaporated, per case	3.35— 4.85	3.97
Evaporated, per cwt.	7.50—12.00	8.74
Condensed skim, per cwt.	4.50— 7.00	6.04
Evaporated skim, per cwt.	2.00— 7.60	4.01

June Powdered Milk

(Report by U. S. Dept. of Agriculture)

Producers supplying powdered milk plants during June received from $1.70 to $2.00 a hundred for 3.5% milk. These plants pay from 15c to 30c a hundred for skimmilk and from 9c to 18c a hundred for buttermilk.

During June powdered whole milk sold for 56c to 60c per pound as case goods and for 24c to 28c per pound in barrels. Powdered skimmilk sold for 40c to 44c per pound as case goods and for 6c to 12c a pound in barrels. Dried buttermilk sold for 3½ to 11c a pound in barrels.

Philadelphia Milk Prices

The Interstate Milk Producers' Association announces that the August price for milk will be $2.94 a hundred f. o. b. Philadelphia and $2.19 a hundred at the 210-mile zone. This applies to the basic quantity. For July surplus, producers will receive $2.09 per hundred f. o. b. Philadelphia and $1.51 per hundred at the 210-mile zone. These prices are based on milk testing 3 per cent fat with a differential of 2 cents for each half point of test.

Cheese Markets

(Report by U. S. Dept. of Agriculture)

Cheese markets were firm under influence of active demand during week of Aug. 9. Some interest in storing although general tendency is to hold off for September make which is expected to be of better quality.

The average wholesale prices on American cheese, style Twins, for the week ending Aug. 9, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending Aug. 9 1924	Aug. 2 1924	Aug. 9 1923
	Cts.	Cts.	Cts.
New York	21.1	20.9	24.8
Chicago	19.2	18.8	22.1
Boston	21.2	21.2	25.2
San Francisco	19.0	18.4	25.7
Wisconsin Boards	18.8	18.3	22.0

The receipts of cheese at these markets were 4,355,438 lbs. for the week as compared with 5,079,940 lbs. last week and 4,755,580 lbs. a year ago.

Wisconsin June Butter

(Wisconsin Department of Markets)

The following is an average report of the operations of 147 co-operative creameries in Wisconsin for the month of June, 1924:

No. of creameries	Price paid for fat	Ave. price rec'd. for butter	Ave. overrun	Ave. amt. fat rec'd.
	cts.	cts.	%	lbs.

Wisconsin Milk Prices

Following are the monthly average prices received for milk by Wisconsin farmers for the first six months of the current year, as reported by the Wisconsin Department of Agriculture: January, $2.26; February, $2.15; March, $2.02; April, $1.72; May, $1.59; June, $1.61.

CHICAGO, Aug. 18—Butter—Receipts, 12,256 pkgs.; creamery, extras, 36¾c; standards, 36c; dairy, firsts, 34@35c; seconds, 32@33c.

Eggs—Receipts, 18,303 cases; ordinary, 28@28½c; firsts, 29@31c.

Cheese—Twins, 19c; Young Americas, 20½c.

FOND DU LAC, Wis., Aug. 16—Average cheese prices (majority of sales), f. o. b. shipping point: Flats, 19¼c; single Daisies, 19½c; Longhorns, 19½c; square prints, 19¾c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Aug. 16: Single Daisies, 17½c. On Farmers' Call Board Aug. 16: Twins, 17½c; single Daisies, 18c; Longhorns, 18c; square prints, 18¾c.

MILWAUKEE, Aug. 18—Butter—Creamery, extra, tubs, 36½c; standards, 35½c; extra firsts, tubs, 34@35c; firsts, 32@33c; seconds, 30@31c.

Eggs—Fresh gathered firsts (new cases), including cases, candled, 30@30½c; ordinary firsts (standard cases), 29@29½c; miscellaneous lots, shippers' cases returned, candled, 26@27c; seconds, dirties, 21@21½c; checks, 21@21½c.

Cheese—American full cream, Twins, 18@18½c; Young Americas, 19@19½c; Longhorns, 19@19½c; Daisies, single, 18½@19c; American, 32c; Pimento, 34c; Swiss, 42c; Brick, fancy, 16@16½c; Limburger, new, 18@19c; imported Swiss loaf, 42@47c.

NEW YORK, Aug. 18—Cheese—Quiet; state milk common to specials, 15@21½c; skims, common to specials, 11@12c; lower grades, 4@10c.

Butter—Quiet; receipts, 6,520 pkgs.; creamery, extras, 38c; special market, 38½@39c.

Eggs—Firmer; receipts, 7,685 cases; nearby white, fancy, uncandled, 53@54c; nearby brown and mixed, 37@47c; fresh first to extra, 32@40c; Pacific coast, 37@47c; western whites, first to extra, 34@52c; nearby state white, 36@52c.

National Dairy Clinic

The National Dairy Exposition annually offers a clinic in dairy agriculture; it visualizes all human progress in the industry and points the way to prosperity. The men of the industry should get together within its gates to pause and compare and set forth refreshed for a year's effort for betterment of themselves and their part in the big work.

W. E. SKINNER.

Friendly Talks for Farm Folks

Mrs. Josiah Sanford has consumed so much rich patent medicine throughout her lifetime that the very thought of a drink of plain, cool water makes her sick. And yet Mrs. Sanford is an earnest W. C. T. U. worker and would be horrified if anyone intimated that she was an addict of strong drink and raging.

Again, Harlow Stebbins takes almost several tons of aspirin and other headache tablets in a year, while he gravely deplores the terrible traffic in drugs and opiates of which every daily paper is full. Some folks dearly love to keep their right hand from knowing what their left is doing.

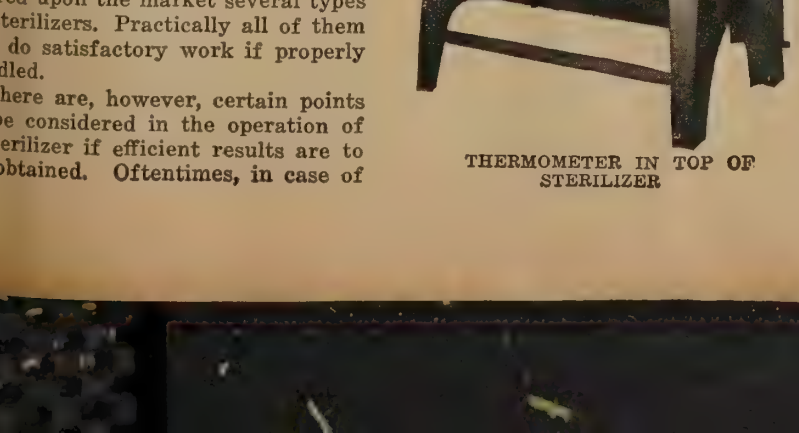
There have been many public men in office who are the country's ideals until the folks composing the country learn of the deals such gentry manage to involve themselves in at public expense.

Our idea of helping the farmer along is to let this pestiferous weed known as "bindweed" live and flourish on the land, then see how many crops are grown annually in competition with it. The few that survived would undoubtedly bring prices calculated to make the most despairing agriculturist break into tears of joy and astonishment.

The Literary Digest copies an extract from a farmer's wife's letter recently appearing in the American Agriculturist. The letter speaks for itself, but will hardly be news to many of the sex who may peruse this column: "In the thirty years of my married life I have served 235,425 meals, made 33,190 loaves of bread, 5,930 cakes, and 7,960 pies. I have canned 1,550 cans of fruit, raised 7,660 chicks, churned 5,450 pounds of butter, put in 36,461 hours at sweeping, washing, and scrubbing. I estimate the worth of my labor conservatively at $115,485.50, none of which I have ever collected. But I still love my husband and children and wouldn't mind starting in all over again for them."

Few men—or women—will ever again experience a thrill equal to the one they knew as the steering wheel was grasped and the foot fed the throttle of the new car—after the salesman had pronounced them fit to drive all, all alone.

You can only harvest potatoes in the fall, the wheat has its own time for getting ripe, corn comes but once a year, fruit ripens invariably in autumn—but good old bossy brings home the bacon every month in the year.



The story is told of one farm woman who became so wed to her faithful Ford that when she wasn't steering it on the road, she had it backed into the kitchen where she did the washing, ironing, churning, cooking, and baking all on and with the aid of the dutiful engine. But we can't help but wonder, if, at twilight, after she had heard its prayers and given it its usual supper of several quarts of oil and gallons of gas, she tucked it up cosily at night in the garage or left it all alone out under the apple tree to dream of ghosts and car robbers. Let us hope that this particular Ford owner was consistent to the end and did not subject her patient friend to any such inhuman treatment.

New York. HELEN S. K. WILLCOX.

New Dairy Husbandry Building at University of Maryland

"Maryland, my Maryland" has long been famous for her herds of pure-bred dairy cattle. Her good cows are found scattered all through the United States and occupying prominent places when it comes to production records. The type of Maryland dairy cattle are unsurpassed as shown by the many winnings at state and national contests.

The past five years have seen much progress in dairy lines in Maryland. Not only have pure-bred dairy cattle of high production increased, but the men who milk cows have become organized into successful marketing groups. In addition there has been an increase in the tonnage of legume hays grown and more interest taken in pasture improvement. The industry generally has come to a realization that its future prosperity depends upon ability to produce high quality dairy cattle and dairy products so economically that they can be sold at a profit in competition.

NEW DAIRY HUSBANDRY BUILDING AT UNIVERSITY OF MARYLAND

As a result of the progress in the dairy industry within the state, a new dairy husbandry building has been erected at College Park and is now being occupied.

Enrollment among those majoring in dairy husbandry at the present time in the University of Maryland compares most favorably with that of the great dairy states. The care, feeding, and management of dairy cattle, the production of high grade dairy products and manufacture and marketing of the same will be featured in the new building.

J. A. Gamble, who was born at Wauzeka, Wisconsin, October 10th, 1882, and who was with the United States Dairy Division for five years where he turned out several bulletins of interest to the industry, has been head of the Dairy Husbandry Department of Maryland for the past six years.

Dairy Sterilizers

Sterilization today plays a very important part in the production of clean and wholesome dairy products. It has been found that the heating and holding of dairy utensils, such as milk cans, coolers, milking machine units, strainer cloths, etc., at a temperature of 212° or more for 20 minutes will very effectually reduce the bacteria count and kill disease germs.

The California law now requires the sterilization of dairy utensils. To meet this demand there have appeared upon the market several types of sterilizers. Practically all of them will do satisfactory work if properly handled.

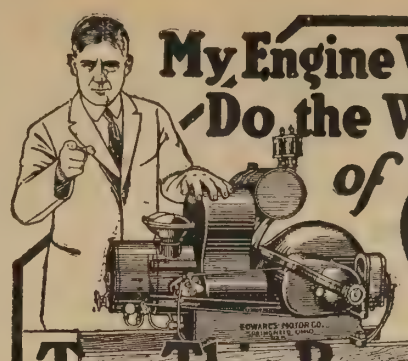
There are, however, certain points to be considered in the operation of the sterilizer if efficient results are to be obtained. Oftentimes, in case of poor sterilization, the difficulty may be traced to the fact that the sterilizing temperature has not been maintained in the sterilizer for the required length of time. Sometimes due to a poorly operating oil burner, a longer time than usual is taken for heating up. The collection of soot upon the bottom of the sterilizer may also cause slow heating. The engineer cleans out the flues of his boiler regularly. The same should be done with your sterilizer. The engineer also has a guage to tell him when his steam pressure is right; in the same way, a dairyman should have a thermometer to tell him when his temperature is right.

In the type of sterilizer which consists of a steam chamber into which steam is furnished from a boiler, it must not be forgotten that it takes considerable time for the sterilizer and contents to heat up after the steam is turned on before sterilizing actually takes place. Therefore, the time of sterilization must not be counted from the moment that steam is turned on but from the time that the contents actually attain sterilization temperature.

From a number of tests conducted by the University of California upon the latter type of sterilizer, results show that when steam was supplied at twenty pounds per square inch pressure to a 4'x4'x5' sterilizer through a three-fourths inch pipe, practically fifteen minutes were required for the temperature of the sterilizer to reach 212° F. This means that utensils held for twenty minutes after the steam was turned on would have been sterilized for only about five minutes or fifteen minutes short.

A thermometer placed in a hole in the top of the sterilizer so that its sensitive bulb extends through into the inside, will show when the proper temperature is reached. It should be used occasionally to check up on what is taking place inside the sterilizer.

A good chemical thermometer costing about $1.50 and reading as high as 220° or 250° F., depending upon the temperature attained in your sterilizer, is the proper instrument to use. It may be attached by pushing it half way through a large cork which will prevent it dropping entirely through the hole in the top of the sterilizer.



THERMOMETER IN TOP OF STERILIZER

Another point of operation is that of opening up the sterilizer after each sterilization and if possible removing the equipment. If this is done, the moisture will be evaporated from the hot surface of the utensils, leaving a dry surface which will remain sterile and at the same time not rust. —A. W. FARRALL, California College of Agriculture.

Soy Bean Growers

The National Soy Bean Growers' Association will hold a meeting at the Iowa Experiment Station at Ames on August 30. A good program has been prepared for discussions by men from various states interested in the production of soy beans. There will also be an inspection of the various experimental plots at the Iowa Station. It is anticipated that this meeting will draw a large attendance.

Says Sam: Good cars and bad, strong men and weak, run about even down hill. It's the up grade that's the test.

My Engine Will Do the Work of 6

"I set out to build a farm engine that would have every feature the farmer wanted and none he didn't want. It has now been on the market six years. Thousands of satisfied users tell me I've succeeded. I'm proud to have this engine bear my name."
—A. Y. EDWARDS

EDWARDS FARM ENGINE

Try This Remarkable Engine FREE

There is no other farm engine like it. Simple in construction and easy to operate. It is only one engine, yet it takes the place of six engines. It will give from 1½ to 6 H. P., yet it is so light that two men can carry it easily. Set it anywhere and put it to work.

Change Power as Needed

It is a 6 H. P. when you need 6, or 1½ H. P. when you need only 1½, or any power in between. Fuel consumption in proportion to power used and remarkably low at all times. Adjustment from one power to another is instantaneous.

Burns Kerosene

Operates with kerosene or gasoline. Easy starting, no cranking. The greatest gas engine value on the market. And you can prove all of these statements to your own satisfaction.

What Users Say

Ivan L. Blake, of Hannibal, New York, says: "Only engine economical for all jobs. I run a 28-inch cord wood saw, a 24-inch rip saw, a washer, a pump, and a grinder, and it sure runs them fine. It has perfect running balance, and it sets quiet anywhere."

Clarence Rutledge, of Manitoulan Island, Ontario, says: "Have given my Edwards four years' steady work and like it fine. It uses very little fuel. I run a 28-inch cord wood saw, also a rip saw, 8-inch grinder, ensilage cutter, line shaft for shop, churn, washer, separator and pump. Have had ten other engines and the Edwards beats them all."

Frank Foell, of Cologne, New Jersey, says: "It's a great pleasure to own an Edwards engine. I run a wood saw, cement mixer, threshing machine, etc. Do work for my neighbors. Easy to move around and easy to run. I would not have any other."

Free Trial Offer

Now—I want to prove my claims to you. I want to send you an Edwards Engine for absolutely free trial. Just write your name and address on coupon and mail. I will send at once complete details about my farm engine and about my free trial offer. No cost or obligation. Mail coupon now.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

My Toggenburg Goats

Lester Alger Johnson, Illinois

When I started my goat project, father bought me two Toggenburg does and one kid for $100. The plan was for me to pay him back when I earned the money. I milked the two does and sold the milk daily for 50c a quart. The money I received for the milk much more than paid for the feed and what was over went toward paying for the goats.

During the summer I sold the kid for $25. One of the old goats presented me with two doe kids on the 21st of November. This was fine luck, I tell you. When these two kids

YOU CAN'T GET LESTER'S GOAT NOW

were one month old, I sold them for $17.50 each. This was cheap, but I needed the milk of the mother more than I needed the kids.

I have seen it stated in print that it costs about 10c a day to feed one of these Lilliputian cows its necessary feed of grain and hay. Bran and oil meal must also be fed. Of course, during grazing season, grass takes the place of hay in the goat's bill of fare. In my project it did not cost much to feed them during the summer. I kept them in the pasture all day and the grain they needed amounted to about 6 cents a day a goat. At night I kept them in the barn where my father keeps his goats. This barn space I paid for by cleaning the entire barn and milking his goats.

Here are a few things I have learned about goats. You can raise them on a small farm, or even a back yard, because they are small and take up very little room. A goat is a very clean animal and will not eat anything that is not clean. I have often heard it said that the milking goat is the exact opposite of the ordinary tin can alley goat. The blue-blooded goats are great on sanitation. They require sanitary stables and yards. Personally, they keep their shaggy coats as spotless as those most particular "tabbies" of the cat world. Sometimes I feed them day-old bread; if the bread happens to fall upon the floor they will not eat it. Seven goats may be kept on the same amount of feed that is required to keep one average cow.

Here is a copy of a letter that I received from one of my customers. I am very proud of it.

DEAR LESTER:—I felt as though I would like to write to tell you how much good your goat's milk did my baby girl. When she started taking it at seven months of age, she was all out of kilter and I had tried many different foods and none of them agreed with her. She took the goat's milk for five months and has been so perfectly healthy that I surely shall recommend it to anyone who has a child that is not thriving. I hope that you will do well in your milk business, and that many monthers may be relieved of their baby food anxieties as I have been.

MRS. L. C. BOYER.

So it is easily seen that besides taking care of my goats and selling the milk, I have helped mothers with their baby food troubles. This, I think, is quite a bit for a boy ten years old to do.

Diary of a Potato Club Boy

(Joseph Drake, the author of this article, is the 1923 potato club champion of Michigan. He is thirteen years old. This is his fourth year as a potato club member in the Upper Peninsula. In cash prizes he won $25 last year. He raised 151 bushels on his half acre, kept 15 bushels for seed, sold nearly 95 bushels as certified seed, and the remainder went for table use. Joseph has a brother, Francis, who is also a successful potato grower and club member.)

Having had good success with my certified seed last year, I decided to plant Petoskey Golden Russets again on new ground.

So my father helped me clear ½ acre of land. He blasted stumps and I hauled logs off with the team to make a log fence. Then we pried out the big boulders with a crowbar and hauled them off with a stoneboat. There was a big pine stump which was determined to stay in the ground; so we got the old Kirsten stump puller and showed him that he wasn't going to have his way.

Then we got a big brush plow and turned under the sod and turned up the rocks and picked them off. We plowed May 28th and I disced and harrowed it May 30th.

June 1st and 2nd, I planted my 12 bushels of certified Petoskey Golden Russets. A few days after planting we had a severe rain storm which washed the soil down into a low place and covered the potatoes so deep that they never came up. Seven days after planting, I dragged them with a spike tooth drag to loosen the soil. June 22nd, they came up and grew pretty well. I cultivated them July 6th with a one-horse cultivator and hoed them the next day by hand. July 22nd, I shallow shoveled them, plowed them for better drainage as plot was on a side hill.

But the potato bugs thought that all this was to make more leaves for them to eat; so I thought I'd fool them and gave them Bordeaux mixture and Paris Green. I gave them this again six different times: July 17th, July 23rd, July 29th, August 5th, and September 7th.

July 26th, 27th, and 28th I hoed these 3 days by hand in between all the potato plants to loosen the soil and kill the weeds.

I joined the Michigan Potato Producers' Association for the purpose of having my potatoes certified, so that I could offer them for sale as pure seed. The first field inspection was made August 16th and the second September 5th, and both passed.

We had a killing frost September 14th which finished all chances of any late blight before time to harvest. I started digging October 1st but threshing time arrived, so finished October 9th. I selected 15 bushels for next year's planting, as I want to grow more potatoes next year. I paid my father for all the help he gave me with the potatoes, and we are going to try to raise a bigger crop next year. Hard work is all right when you make good.

Final inspection was made October 19th, and I was some pleased when told that my potatoes passed O. K. Club work brings good results.

November 24th, sold and shipped potatoes to a Pennsylvania buyer. My neighbor, my brother, and I shipped a car of 600 bushels. It was the first car of certified seed shipped out of Iron County in the Upper Peninsula of Michigan.

I exhibited at Grand Rapids and won first and also exhibited at Farmers' Week, East Lansing, and won first and fourth places and was chosen potato club champion of the state and awarded a silver cup.

ROMA AND EUNICE HORN, WISCONSIN'S 1923 STATE CLUB CANNING CHAMPIONS

Who will win this year? Soon boys and girls in many states will be competing for honors at their fairs. Some will be on 4H club demonstration teams. Others will be exhibiting calves, pigs, poultry, and other products of their *work* for the past year. Big plans are astir in every state to make this year's 4H Club Show the best ever.

Will you be going to your state fair? If so, write the Junior Editor about it. Hoard's Dairyman Juniors are winners. Each one is like a rubber ball—the harder you throw it down the higher it rises. A half million boys and girls all over this nation have been engaged in 4H club work this year, learning to use their hands, heads, and hearts. Are you going to be one of the winners? "A winner never quits and a quitter never wins."

A Cotton Country Calf Club

The Lancaster County Jersey Calf Club, formed a little more than a year ago, is not only the first regularly organized calf club for South Carolina, but is another mile-post marking the advance of the dairy cow in the more progressive system of farming which is fast replacing the old cotton system in the Palmetto State.

Sixteen calves were shown for the many prizes awarded by the American Jersey Cattle Club, several commercial concerns and local business houses at the county fair last fall.

In addition to being entirely cared for by their boy owners, these calves

FURMAN HAMMOND WITH OXFORD'S ROBBIE, BLUE RIBBON WINNERS

were home-grown and daughters o the Lancaster County Jersey Bull As sociation sires. Five of the first six heifers in the ring were association sires.

According to C. G. Cushman, dis trict dairy husbandman who did th judging, "the blue and red ribbo calves, grown from birth, fitted an trained for the ring by Furman an Ralph Hammond, were, from th standpoint of training and condition eligible to grace the ring at the Na tional Dairy Show".

The club is planning an exhibi for their coming state fair.

Local Calf Round-up

Mr. R. G. Waltz, Montgomery Cour ty Agent, Pennsylvania, reports tha there was a pure-bred Holstein ca round-up held one day the latter pa of June in Upper Hanover Townshi James L. Wood, a Holstein breede has been the local leader of this clu The calves were assembled on h farm. S. J. Brownell, dairy extensio specialist of State College, and A. Barnhart, assistant state club lead

officiated. Approximately sixty persons were present at the meeting. The Quaker Oats Company of Philadelphia presented a silver loving cup to the winner who is to have the cup for one year. The Holstein-Friesian Association of America gave ribbons to the first four winners.

The placings were as follows:
(1) Homer Bieler, (2) John Pfrommer, (3) Oren Woodward, (4) Luther Pfrommer, (5) Clifford Wood, (6) Harry Wood, (7) Donald Wood, (8) George Wise.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

So thoroughly does George M. Briggs of the Wisconsin College of Agriculture believe in the value of soy beans that he carries a few of these beans in his vest pocket and prescribes them to his friends and audiences as the pills that save doctor bills. His enthusiasm as a preacher of soy beanisms has won for him the nick name "Soy Bean" Briggs. In last week's Hoard's Dairyman (August 15) is an article from his pen entitled "Making Soy Bean Hay" that is worth the attention of you junior dairymen.

Is soy bean hay a good milk feed? Yes. In two trials at the Wisconsin Experiment Station comparing alfalfa and soy bean hay for milk production, very little difference was noticed in these two legumes.

When should soy bean hay be cut? The best stage of growth at which to get the most protein is when the plant is just blossoming. At this stage the plant is leafier. However, the weather is such a big factor in curing soy bean hay that Mr. Briggs advises to "cut in good hay curing weather".

How is soy bean hay best cut? There is no best way, says Mr. Briggs. Cutting with the mower, then using a side delivery rake after leaving in the swath for one day makes a very desirable method. It is sometimes cut with a binder and put up in shocks.

How should this hay be handled? Hay cured in the cock is found to have a higher feeding value than hay cured in the swath. Soy bean hay cocked when rather green, before the leaves become brittle, will shed water better than when cocked later. The hay cock should be high and narrow rather than low and wide.

Explain how sweet clover pasture saves labor. When sweet clover is grown in place of blue grass, the pasture feeding period is made four months longer and no supplementary feeding of roughage in the barn is needed. This saves four months of barn feeding labor through the busy season of crop work. It also saves the labor of growing, harvesting, and storing this summer feed. In many cases this means the saving of one hand's wages, his board, room, and washing. (See Wilber J. Fraser's article.)

Junior Letters

Ruth Keeps Every Issue

Hoard's Dairyman Juniors:—As I belong to no club except our wonderful junior club, I will tell you about our mission band. Of course you all know what it is for. It was organized in November, 1922. Twenty-one of us joined. We call it the "Tooker Mission Band" Our aim is to send a little of the Christmas spirit to other children. The Christmas of 1922 we made a box of 57 handkerchiefs and sent it to the Tooker Memorial School at Oakland, California. Last Xmas we sent dolls, books, and many other articles to other places.

I wonder what keeps Edna Dougan and Grace Miller from writing. I have written to both of them but have received no answers yet. I also wrote to Margaret Wallace.

Say, I have a suggestion. If any of you juniors move, let the junior editor know. My brother wrote to Willis S. English, Galena, Ill., but the letter came right back to him. We thought maybe he had moved away from there.

I was 13 years old the 8th day of March. I wonder if I have a twin. If I have, I wish he or she would sit down quick and write to me.

I wonder if any of the rest of the juniors keep our wonderful paper. The Hoard's Dairyman I mean, of course I do. I have three great big piles of them. I can hardly wait until the next paper comes.

Have you all planned what you are going to do this summer? I have. My father's mother is in very poor health so I am going down there to help her this summer. If I get lonesome down there all I have to do is to go to the storeroom. They keep just hosts of old magazines there and it is lots of fun to look at them.

Hoping to receive bushels of letters from the juniors I will close. My address is R. 1, Box 80, Hicksville, Ohio. Ruth Battershell.

Making a Dog Harness

Hoard's Dairyman Juniors:—The reason I have not written is because we haven't a camera to take a picture. But the other day I got a snapshot of my dogs, sister Maud, and myself.

To make the harness for my dogs, Ring and Bounce, I found a wide strap and cut it in the shape of a breast strap. Then I

MAUD AND JIM CHURCH DRIVING RING AND BOUNCE

got a narrower strap and put over his shoulders to hold up the breast strap. Then I got a long strap and cut it in two pieces the same length. In one end I fastened a ring; the other end I fastened to the breast strap. Then I found a shorter strap and made a back band. That is all the harness I have on Ring, the darkest dog.

On Bounce I have a breast strap and a strap to hold it in place. I could not find a strap the right length to make tugs so I took the cross piece out of a tire chain and made tugs out of the two side pieces. That is all the harness I have on Bounce. I use Ring's harness on the goat, Billy. It is a little too small but I have got along with it so far. I don't use a bridle on the dogs but Billy is too headstrong to drive without one. I looked in a catalog at a goat harness and modeled mine after it the best I could.

Colorado. JIM CHURCH.

Navaho Sheep

Hoard's Dairyman Juniors:—I received the creed some time ago. I think it is very nice.

I took part in the State Spelling Contest of Colorado this spring. I won the District Contest and got to go to the County Contest. There I tied with another girl. We got 99 per cent. The second list I got 88 per cent and the other girl got 94 per cent so she won there.

This is my story about Navaho Sheep:

Navaho sheep belong to the mutton class. They are a very thin boned sheep, and the meat is of good quality. They are tall and slender. The wool of Navaho sheep is one of the poorest grades of wool. Some Navaho sheep are white; others vary in color from light brown to black. It is very seldom that Navaho sheep weigh one hundred pounds. The usual weight is from eighty to eighty-five pounds.

My father gave me my sheep when it was a baby lamb. That was in the spring. When we sold its mother I put it in a pasture with two other Navaho lambs of the same age. There was good grass, a shade tree, and running water most of the time in the pasture. Besides, I fed them some grain all summer. In the early fall I gave them green corn.

When I went to fatten them in the late fall, I put them in a smaller pen and fed them all the grain they would eat and alfalfa hay. My lamb gained the fastest.

My lamb weighed ninety-seven pounds when I sold it and I received 12½ cents a pound for it. That gave me a gain of $5.75. Our address is Broomfield, Colorado.

MAUD CHURCH.

The Kelly Commercial Cord

—an extra rugged tire that will stand up under the rough all-around service tires are called upon to give on the farm

Have you found a pneumatic tire that gives you the kind of service you'd like to get on your car or farm truck?

If you haven't, try one of the new Kelly Commercial Cords.

Extra sturdy, with a massive tread and added strength where strength is needed to make a dependable, long-wearing tire, this addition to the famous Kelly line is the strongest, most serviceable pneumatic tire that Kelly—or, so far as we know, anyone else—has ever built.

It is giving amazing mileage and we unqualifiedly recommend it, particularly for use under conditions where ordinary tires have failed to stand up.

Now made in all sizes from 30 x 3½ up to 40 x 8.

Get your local Kelly dealer to show you one.

STOCK FOR SALE

I have usually 100 head of registered and high grade Holsteins on hand for sale. Also registered and imported Percheron and Belgian horses. RALPH HUDSON, Milton Junction, Wis. 12-*

For Sale—At "The Big Farm", Rosendale, Wisconsin, high grade and pure bred Holsteins by the carload. Also will help any buyer to select anything in dairy line in either Holsteins or Guernseys. JOHN MURPHY and JOHN FARRELL, Rosendale, Wis. (Formerly of Mukwonago, Wis.) 5-*

Holsteins For Sale—Will have to sell a number of young cows cheap; also some heifers and calves; all stock tuberculin tested. Write for particulars. E. F. THOMAS, Oconomowoc, Waukesha, Co., Wis. 11-*

Springers—10 Registered Holstien cows and heifers, cheap. AUGUSTINE BROS., Pound, Wis 19-*

Holstein springers and fresh cows. W. STRAUSS, Route 5, Watertown, Wis. 3-4

Holsteins—Carload young cows $75.00. EDWARD YOHN, Watertown, Wis. 4-5

Five head registered Holstein females, four to freshen by January. One with A. R. O. record. Forced sale $550.00. Write for particulars. FLOYD HARRIS, Mantorville, Minn. 5-2

Milk Producers—Let us figure with you on a load of Holsteins or Guernseys. Clean stock, heavy producers. Write or call EDGEWATER STOCK FARM, Fort Atkinson, Wis. 5-*

For Sale—Some good pure-bred Holstein bulls from A. R. O. dams. One ready for service. Several others will be soon. Prices $50 to $100, depending on age and record of dam. PORTER FARMING COMPANY, Colfax, Iowa. 5-2

Waupaca County high grade Holstein and Guernsey cows and heifers for sale in carload lots or will assist you in buying. JENNINGS FARMS, New London, Wisconsin. 5-7

Registered Guernsey heifers and bull calves. FAIRVIEW FARMS, Brodhead, Wis. 13-*

Registered Guernsey bull calves from high testing dams. Accredited herd. Reasonable prices. QUINELLO FARMS, Thiensville, Wis. 23-*

Oakland Guernsey Farm—(Since 1890) Mukwonago Wisconsin, offers carload high grade Guernsey springers, choice of our herd. T. B. tested, 5-six weeks old heifer calves $150, express paid. 24-*

Young Guernsey Bulls, A. R. breeding. Federal accredited herd. MATH. MICHELS, Peebles, Wisconsin. 24-*

For Sale—2 cars of high grade Guernsey cows and heifers to freshen soon. J. J. JENNINGS, New London, Wis. 5-2

Registered Guernsey bull eighteen months old. From A. R. stock. M. F. McNOWN, Onalaska, Wis.

For Sale—My Guernsey herd sire, 3 years old, May Rose and Cherub breeding. Bred by the Iowa State College. A. B. HOLLINGSWORTH, Mt. Pleasant, Ia.

For Sale—Entire herd registered Brown Swiss, eighteen cows and heifers, herd bull, young bull. THOS. LOVE, Howell, Mich. 5-3

Sunny Crest Farm accredited Jerseys. Bulls, 4 to 16 months, $35.00 to $75.00. Also a few heifers. M. EMERSON & SON, Wheeler, Wis. 4-spl

For Sale—30 head of high grade Jersey cows and heifers. Will freshen in September and October. BOYD BERDO, Washington, Iowa.

Breeding Problem Discussed

HOARD'S DAIRYMAN:—In the Jan. 18th issue of Hoard's Dairyman Mr. Graves' discussion on breeding problems was a most interesting presentation of the subject. A careful study of his illustration of the performance of the three sires which he presents brings out some pertinent facts which every breeder should have clearly in his mind. Namely—that while close breeding (I use the term close to include in and line breeding) is very essential to intensify hereditary traits, it works both ways. It intensifies undesirable as well as desirable qualities. Hence we must keep a watchful eye to eliminate as much as possible the undesirable ones, whether it be production or type, through out-breeding. In carefully studying the performance of the sires of Mr. Graves' paper, I have made, out of the data presented, the following tables. These tables I believe enable one to follow Mr. Graves' discussion with more ease and less confusion. Tables 1, II, and III show the performance of the dams and their daughters by sires A, B, and C, the number in each class, and the increase of daughters over dams' production that is due probably to the influence of the sire. Table IV is a summary of the other three tables, while Table V shows the total performance of all three sires in the different classes:

Table I—Daughters of Sire A

	No. daughters	Average Dams	Pounds Fat daughters	Increase
Inbred	2	693	756	63
Linebred	4	525	581	56
Outbred	11	504	608	101
Ave.	17	531	617	86

Table II—Daughters of Sire B

	No. daughters	Average Dams	Pounds Fat daughters	Increase
Inbred	4	661	690	29
Linebred	7	569	762	193
Outbred	8	619	675	56
Ave.	19	610	710	100

Table III—Daughters of Sire C

	No. daughters	Average Dams	Pounds Fat daughters	Increase
Inbred	4	667	684	17
Linebred	1	379	406	27
Outbred	2	549	720	171
Ave.	7	592	654	62

Table IV—Performance of All Daughters of Each Sire

	No. daughters	Average Dams	Pounds Fat daughters	Increase
Sire A	17	531	617	86
Sire B	19	610	710	100
Sire C	7	592	654	62
Ave.	43			88

Table V—Performance of All Daughters According to Breeding

	No. daughters	Average Dams	Pounds Fat daughters	Increase
Inbred	10	669	701	32
Linebred	12	538	672	134
Outbred	21	552	642	90

A careful study of these tables reveals an interesting story in breeding. At first glance we note that the increase of fat produced by daughters in the inbred class is rather small. This might lead to an erroneous interpretation that inbreeding is not conducive to increase production. But when we see that all the dams in the inbred class were high producing animals, we have to modify our first impression. In fact, I believe that it shows that inbreeding in this particular case was successful as far as production is concerned. If this small number of animals be taken as a criterion for inbreeding, we can say that if every other hereditary factor of desirable characters is as well represented as production we are safe to practice inbreeding, even with high producing animals. We find that sires A and C show the highest increase in the outbred daughters. It then looks that as far as sires A and C outbreeding shows the best results. But, we are again disllusioned when we note that the dams in these classes are the lowest producers, hence the possibility of largest increase of their daughters, due to the influence of the high inherited producing factors of those sires.

We also note how heredity has intensified through close breeding. The daughters of sire C, in this class, show an increase of 70 lbs. over those of sire A. Sire C is a grandson of sire A.

It seems that the most striking result is brought on in the linebred class. Sire B is an inbred son of sire A. When mated with high producing linebred females the increase is the largest, while sire C in linebred mating with low producers shows the lowest increase. There is the warning that has a practical bearing. Low production is present, as an inherited factor, even in a high producing animal. When this low production is present in both through the same parents, the offspring is practically neutral. The high producing hereditary factors of sire C, which have shown themselves when mated with high producing inbred females and comparatively low producing outbred females, have been checked when mated with closely related low producers. In this case it seems that a recessive character which was present in both parents has become intensified and become dominant.

When we turn again to the last table we find that the linebred daughters of all three sires show the largest increase. If we can draw any definite conclusion from these animals (I doubt if the numbers are sufficient to warrant definite conclusion) it clearly points that linebreeding is the safest road to increase production, provided, however, we eliminate the low producing linebred animals.

New York. ED. TANSKY.

Indiana Dairy Field Day

The fifth annual field day program of the Indiana State Dairy Association was a big success. The crowd began to arrive at the fair grounds early on August 6. There were over 6,000 people, practically all farmers from the surrounding counties and states.

Judging began at 9:30 a. m. There were 222 animals exhibited by 68 exhibitors, 26 of which were breeders, 23 Jersey calf club members, 18 Holstein calf club members.

R. L. Haeger of Illinois judged the 107 Holsteins, to the complete satisfaction of all exhibitors, and his work was highly instructive. Professor L. H. Fairchild placed the ribbons on the Jersey classes in his usual satisfactory manner, and very much to the pleasure of the exhibitors of the 117 head of Jerseys.—E. A. GANNON, Sec.

Extending Height of Concrete Silo

HOARD'S DAIRYMAN:—The writer was called on a few years ago to extend the height of a 20-foot concrete silo.

Materials were ordered and within a couple of days the new forms were being hoisted in place.

Before placing the forms the upper edge of the old concrete wall was

FIG. 1—RAISING UP THE FORMS

chiseled off on both edges to form a fairly sharp edge to receive the new concrete. This precaution was taken so as to be sure that there would be a good bond between the old and new walls. Also there was no reinforcing rods protruding onto which the new concrete could be anchored. Then the forms were set and the old concrete wet thoroughly. Following this several buckets of pure cement, mixed with water about like thin paint, was poured on the wet wall. Immediately following this the concreting was begun before the old wall had time to dry out.

An extra amount of reinforcing rods were placed just above the old wall to insure strength, there being

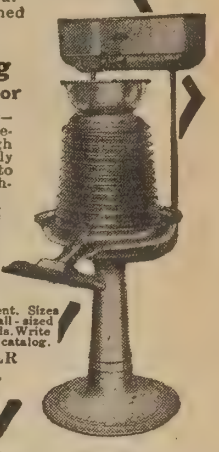
FIG. 2—THE COMPLETED SILO

no record as to whether the silo was reinforced for additional height.

The silo has been in use for several years and no signs of leakage or cracking of the walls where the extension was begun. Fig. 2 shows the silo after 12 feet had been added. The forms were constructed by the illustrations and specifications prepared by the Portland Cement Association, Chicago. Any well informed carpenter can take this literature and blue prints and construct forms for building a concrete silo.

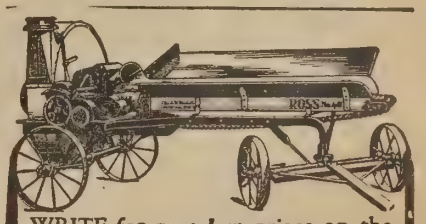
The mixture used was one part Portland cement, two parts clean sand, and four parts gravel, by volume.

Pennsylvania. R. U. BLASINGAME.



Says Sam: A neighborhood without a community hall is like a family without a sitting-room.

A Better Milk Bigger Profits



Keep your milk sweet and wholesome by cooling and aerating it with the "Chilly King" Prevent losses from souring and returned shipments

Chilly King
Cooler and Aerator

Cools milk perfectly—without ice—and secures its thorough aeration. Simply built. Easy to clean—no filth-catching corners. Milk flows in a thin film-like sheet over V-shaped Spiral Rings. Practically 100 per cent efficient. Sizes for all-sized herds. Write for catalog.

POULTRY On The DAIRY FARM

J. B. HAYES

The Floor and Walls

A good foundation is a necessary prerequisite for any building and is a special requirement in a poultry house. Since the floor is a part of the foundation, special emphasis must be given to the construction as a decided aid to proper ventilation. Although the floor may be of stone, cement, or other material that seems impervious, more moisture passes through than one will ordinarily consider. More good houses are cussed for the first year because of floor construction than any other point.

Any type of floor requires a good concrete wall that is trenched deep enough to avoid heaving by frost and will prevent outside burrowing of rats. A little too much is preferable to not enough and one should plan on overdoing in preference to a shallow, make-shift sort of construction. Bolts must be countersunk in the wall so that the sills may be securely fastened.

If one is not averse to removing the top eight or twelve inches each year and replenishing with fresh material, a gravel floor can be used. It is well to remember that rats will become troublesome and that a dirt or gravel floor is not of any special benefit to the flock. Dusting on the part of hens may be practiced but is not necessary. A seasonable change of the top layer is required to prevent possible disease infection, for that layer will become filthy from the constant collection of droppings.

A cement type of construction has several advantages in that it is easily cleaned, rat proof, and permanent. When properly built there are few, if any, disadvantages. Although claims are often made that hens wear off their toe nails, contract humble foot, rheumatism, and a flock of other ails, the contention is not supported.

The first error that usually occurs is building in the late fall. The house can be constructed at that time when the rush of farm work is over but the floor must be laid during the early summer. Green or fresh concrete is still saturated with water and proper ventilation is not possible. In one instance that I recall the owner had put up the house late and would have sold cheap that winter for the walls were soaked, the flock sick, and production as low as possible. During the following summer the building dried thoroughly and since then his building has been ideal. In building remember the one point, to steal time and put in the floor early although the rest of the building does wait.

A fill of either cinders or gravel should be used as the base. After tamping this a layer of building paper should be spread and on top of that the coarse concrete and the finish. When building tile are obtainable at bargain prices they can be used with the concrete finish. In many cases seconds or multilated tile are obtainable. Others put the layer of paper between the coarse concrete and the finish. In such cases a heavier finish is required.

Building paper tends to break the capillary action or movement of water upward. Heavy soils are worse in this character than sand but in any case it is cheaper to be safe than sorry by constructing the floor properly.

Wooden floors are used in many sections but are not as permanent. They are also somewhat harder to keep in repair, tend to be cold when the house is elevated, and allow an easy access for rats. The whole chicken fraternity is not agreed on that point but the bulk does seem more inclined to concrete construction.

Even though it is claimed that the concrete is cold, one expects to keep that floor covered with litter and it is little if any time that the hen spends in direct contact. If the belief could be sold that such was the case and it made flock owners keep a clean, dry litter in the house, they would get results in spite of what they thought.

When it comes to the type of wall construction we must shift and boost for nothing but wood. Solid stone or concrete walls are advised for a root cellar but do not work in a poultry house. Various types of hollow tile and concrete blocks are giving varying results but I have not seen conclusive proof of their adaptability at this time. The walls must be dry, prevent moisture condensing and poor conductors of heat. These factors are found to a great extent in wood.

The amount of show that is desired will control the selection of siding to be used. A layer of roofing paper should be placed on the outside of the studding and the boarding nailed directly over the paper. This added insulation for the colder sections in particular is needed. What one desires is a uniform temperature and no drafts. The three sides should be well constructed with special emphasis to the north side and the east and west ends.

In most parts of the northern states the east sides should be lined on the inside. If one does not wish to line the entire interior, the side walls out as far as the dropping board and the north end should be covered to give additional heat to the roosting section.

Many forms of insulating material are on the market at this time that are giving satisfactory results. This type of interior construction is decidedly preferable to lath and plaster at about the same cost. Although many flock owners are sold on the idea of plastering as a preventive to parasites, I doubt very much whether it is worth while under any conditions. It always seemed to me as though such houses were very damp regardless of the ventilating system that was in use.

Poultry Production

To agricultural students desiring a comprehensive and convenient statement of the principles of poultry production, there is recommended a book by Professor W. A. Lippincott of the Kansas City Agricultural College. It is largely used by agricultural schools and colleges. It is not only a good text book for the student in school, but also for the student on the farm.

The consideration of breeding is confined to recognized principles and their application in the practical poultry plant. Hygiene, housing, and allied topics are fully treated. Nearly half of the book is devoted to the problems of feeding to secure a maximum of economical production of marketable products. Food values, balanced rations, preparation of feeds and feeding methods are presented fully and in a manner that appeals to the man not interested in scientific discussion. Every detail of commercial poultry keeping, breeding, incubating, rearing, feeding, marketing, is treated fully and clearly. Special stress is laid on the finishing of the product for market and special market development.

"Poultry Production" is published by Lea and Febiger, and may be secured postpaid through the Hoard's Dairyman Book Department at its regular price of $3.00.

VETERINARY

Advice is given free in this department. quiries must be signed by the writer, and ould pertain to veterinary matters only. here an immediate reply and prescription e desired by mail, the inquiry must be ac- mpanied by a fee of one dollar. In every stance it will be necessary to give a full scription of the symptoms present.

Rabies in Cattle

When a mad dog has run amuck a farming district biting animals at come its way, some losses from bies will be likely to follow. We ve often seen sheep succumb to e disease some time after being tten and usually in less time than months which seems to be about e maximum length of time at which ese animals and cattle become af- cted when bitten. It is possible r the infection to show up later an that, but such instances may be nsidered rare. In a recent article e described the symptoms of puer- ral mania or craziness in pregnant ws. That disease and rabies may adily be differentiated if the fol- wing symptoms of the latter dis- se are remembered. Usually there a history of attacks by a strange g in the pasture or on the road. he symptoms do not occur suddenly t are ushered in by great restless- ss and excitement. Gradually the mptoms become more violent and e animal at length shows acute af- ction of the brain. Appetite is lost. ilk secretion shrinks and becomes ppressed. Feces and urine are asmodically voided. Soon the ani- al becomes furious, bellows persis- ntly as if in heat, charges about, awing up the dirt and attacking nimals and people. The teeth are sed in such attacks, which was not e case in the mania of pregnancy. a stick is poked at the animal it is stantly grasped with the teeth. We ve seen an affected cow tear her vn skin, but that is much more com- only done by a rabid horse. The es are wild, staring, with the pu- ls wildly dilated and the white of e eyes reddened. Soon these furi- us symptoms come to a climax. hen they gradually lessen, the ani- al weakens, staggers about, goes wn paralyzed and dies in a day or o from the time of appearance of e characteristic symptoms.

Medicinal treatment fails to cure bies, but there is a possibility of reventing the disease in a bitten an- al by immediately giving it the Pas- ur serum treatment and repeating e injections at the times directed by e firm supplying the biologic. This eatment, will, however, only prove ofitable when the animal is of un- ual value on account of pedigree, amily, or superior producing ca- acity. Some good may also be done, the way of prevention, by instant- cauterizing the wound from the te. This may be done with a point- red hot iron, the platinum point a thermo-cautery or with pure rbolic acid. Some believe in the jection permanganate of potash so- tion or tincture of iodine.

The bitten animal should be con- ed so that there will be no possi- lity of it injuring man or animals. s the disease runs such a rapid urse and proves fatal its true char- ter will soon become apparent. ther forms of craziness may shortly sappear. They do not prove fatal, a rule, unless due to acute dis- rbances of the brain, from sun- roke, or over-driving, or to so-called rage poisoning or botulism. Crazi- ss of the pregnant state does not use death. If an animal is watched d quickly succumbs but a certain agnosis of rabies has not been pos- ble, the head should be sent on ice the nearest hygenic laboratory for xamination. If the brain shows the resence of the nigri bodies, that is proof positive of rabies. Persons who have been bitten should at once sub- ject themselves to the Pasteur treat- ment.

Abortion—Garget

I am milking about 15 cows. Have been on this farm about one year. It was a dairy farm 4 or 5 years before and I know there was some contagious abortion among the cows. I have had 10 or 12 calves come past year and all cows have done well, but 2 days ago had cow lose calf at about 5 or 6 months. Now, what I am anxious to know if there is good reasons to think this is the beginning of contagious abortion in my herd. If likely, what can I do?

During past year have had a good deal of udder trouble. I take it to be garget. Cow first stops eating well, then milk don't strain —seems to be little thick, then soon udder gets swollen and milk is lumpy or stringy. Cow almost goes dry but milk continues bad.

Had fine heifer to freshen last July; big udder and promised to be heavy milker but bag caked and I never did get over 6 quarts a day from her. Now and then different quarters of bag had lumpy milk which would clear up in few days. Cow went dry soon, she will freshen July 9th.

Plant City, Fla. C. W. M.

1. We should advise you to isolate the cow that aborted and to cleanse, disinfect, and whitewash the stall she has occupied, including the floor and gutter. To determine if she is affected with the contagious abortion disease your veterinarian should arrange to have a sample of her blood tested by the agglutination method or the state agricultural experiment station or by some pathologist or bacteriologist who undertakes such work. Meanwhile the cow should be disinfected by the veterinarian but not bred sooner than the time at which she would have been bred had she not aborted. For particulars relative to abortion study bulletins on the subject which can be had from the U. S. Department of Agriculture, Washington, D. C., and some of the experiment stations, notably that of Wisconsin, at Madison, and Missouri, at Columbia.

2. Contagious abortion disease and germ-caused mammitis, mastitis, or garget are often closely associated. One cow may be a carrier of the infection, therefore eliminate any one of them that has chronic udder disease. Instantly isolate any cow that is attacked by mammitis and keep her separate until perfectly recovered. Have such cows milked by one who does not attend to the other cows or at least milk them last. Catch abnormal milk in a pail containing a disinfecting solution and then throw it out in a place to which cows have not access.

3. Strip affected quarters, clean once an hour, at time of attack. Bathe persistently with hot water or poultice with hot antiphlogistine containing a little turpentine and spirits of camphor. Have your veterinarian give hypodermic treatment with mastitis bacterin and any internal treatment he deems advisable. Unless pure-bred and very valuable on account of pedigree or performance, cows with spoiled quarters should be fitted for the butcher. If bred and allowed to nurse their calves, keep them away from the other cows. When cows stand in stagnant water they may infect their udders, therefore it would be best to keep them out of the ponds on your farm.

Frosted Teats

Would like to know what is good for frozen cow teats?

Telluride, Colo. K. T. McK.

Treatment at the time of the freezing is the same as that usually applied in frost bite affecting man. If peeling of skin leaves sores afterward an ointment composed of one-half an ounce each of carbolized vaseline and benzoated oxide of zinc ointment, adding one dram of subnitrate of bismuth, will be found excellent as a healing salve.

Is Hoard's Dairyman a real help to you? Why not tell your neighbor about it? The good things we share with others are the things we most enjoy. Get up a little club of subscribers—now—and send them in.

The Hongkong Dairy Farm

(Continued from page 123)

of scrub, trenched it over eighteen inches deep, dug in about sixty tons farmyard manure per acre and planted grass, they had to pay an annual rent to the government from $7 to $12 per acre.

Guinea grass is very succulent when cut young, but is almost useless for soilage when allowed to run to seed. It grows rapidly in moist weather and has the advantage of being an exceedingly heavy cropper. It is weighed in daily by picul-stick at the doors of the cow sheds. It is estimated that the weight of green grass per acre per annum runs from forty to forty-four tons. This weight is not obtained by "sitting down and looking at it". The company keeps a large staff continually working at it, either hoeing, manuring, cutting by hand-hook, carrying it in handy buckets to be weighed at cow sheds, or lifting old roots and recultivating the ground, which is done once every two or three years. The grass is planted with fresh slips taken from old roots and carefully inserted at regular intervals of about fifteen inches.

Silos

During the spring and summer season, grass grows very rapidly, and the 1,000 cattle now on the company's farms are unable to consume the entire quantity grown on 100 acres of land of very inferior quality. The surplus green fodder is converted into silage, which is the only substitute for green feed obtainable in sufficient quantity during the winter months in Hongkong. Eight silos are scattered over the farms at convenient centers and have a combined accommodation of about 800 tons silage; they are built with stone against the hillsides with the interior surface cemented smooth. Paths along the hillsides lead to the filling platform near the roof of the silo and there the grass is chaffed before being thrown into the pit.

Farmers' Income From Cows

HOARD'S DAIRYMAN:—Bloomer, Wisconsin, is a thrifty, well built village of 1700 population. Has a $300,000 condensery which paid to 942 patrons for the first 8 months of 1923—$670,875.14 for 26,468,735 lbs. of milk. It made in the above 8 months, 7,144,560 1-pound cans of condensed milk and 1,562,016, one-half-pound cans of condensed milk. The factory employs about 40 people.

The farmers are raising less hogs and potatoes, devoting most of their energy to dairying and some sheep are raised. Last year the pea-canning factory paid out $150,000 to patrons. The Farmers' Shipping Association shipped from 800 to 1200 cars of farm products. There are two banks in town with combined deposits of about $1,250,000. Some tobacco is being raised but their potato acreage is being cut down. Several farmers are raising alfalfa successfully and many more are planning to do so.

Wisconsin. L. S. BOHRNSTEDT.

Uncle Ab says that co-operation means sharing the downs as well as the ups, and that there are always some downs.

R. LAACKE COMPANY, 553 Third St., MILWAUKEE, WIS.

New York Experiment Station Jerseys

(Continued from page 124)

is the farmer who recently stated that due to the low price of milk he could afford to feed his cows nothing more expensive than cornstalks with a grain ration consisting of equal parts of corn and oats. In the eastern states one hears much of the so-called test or forcing ration which is used for cattle that are attempting to make a good record under supervision of the State Agricultural College. This ration usually contains 24% protein or about half protein concentrates in the grain mixture.

Good production and breeding records cannot be obtained with poor feeding and management. They may therefore give a fair idea of the adequacy of the feed for this purpose. In June, 1922, Register of Merit testing was begun in the Station herd but all cows on test must remain in experiment and they cannot be force-fed for a high record. Four cows completed their records in 1923. They produced an average of 8,938 pounds milk containing 508.3 pounds fat which is the equivalent of 635 pounds butter containing 80% fat. One of the animals was 2 years, 11 months of age and another was 12 years, 11 months old. During 1923 a total of 21 cows were bred, including three cows past 14 years of age and two cows 12 years old. Fourteen of these cows became pregnant with one service; six became pregnant with two services; and one cow 15 years of age required four services. The three cows past 14 years of age produced an average of 436 pounds fat. Such production records and good breeding condition after 23 years of feeding this medium protein grain mixture and legume hay in the same herd indicate that it amply cared for the needs of the cattle. Furthermore, this grain mixture when fed with alfalfa or clover hay and corn silage meets the requirements of any feeding standard in use today.

[EDITOR'S NOTE:—This is the second of a series of four articles by Mr. Dalberg on lessons from the herd experience of the Geneva Station for the past quarter of a century. The next will appear in an early issue.]

West Salem is on the main line of the C. M. & St. P. and of the C. & N. W.
Write us or better still come and select just what you want.
O. G. CLARK & CO., - - - - WEST SALEM, WISCONSIN

MARSH FARM GUERNSEYS

Founded upon CHERUB blood, combining modern show type with production. At the last 13 National Dairy Expositions 46 out of 78 championships have been awarded to cattle from this farm. There are now in the herd 40 cows with yearly records of 500 pounds of fat in Class G. to 900 pounds of fat in Class A. In your efforts to improve the type of your cattle, the show ring records indicate Cherub blood as the really sure way. We will be pleased to advise with you about your next sire.
MARSH FARM - - - Waterloo, Iowa

MIXTER FARM GUERNSEYS
A Complete Foundation Herd For Sale

Our herd, established 35 years ago, now includes 300 registered Guernseys bred on the farm. Its size enables us to offer for sale a complete herd consisting of a 3-year-old bull and 10 excellent females. The price is very reasonable. Write us today for complete information.
MIXTER FARM, (*Fed. Accredited Herd*) J. S. Clark, Mgr., Hardwick, Mass.

EL JANE GUERNSEYS ARCADIA, MISSOURI
(85 miles south of St. Louis)

Not the largest herd but an exclusive herd of pure-breds. Every cow with a record, now on test, or in preparation for test.
Mr. Farmer, Dairyman, or Breeder, anywhere, take notice!
BULL SALE — Since our last dispersal of bulls we have accumulated 7 that are now ready for any kind of service. We also have 6 calves. These animals are from high producing dams with records. Ten of these animals will go well in show ring. You will want one for fall service. We want to dispose of them NOW. Tell us the age you want, what you want to pay. We will send you pedigree and price list. Our proposition is 25% discount next thirty days on serviceable bulls, and 20% discount on calves. Also have several well bred young cows. Let us both make some money by buying NOW at the right price.

BROWN SWISS

WISS VALLEY GIRL 7TH NO. 4678

Breed Brown Swiss Cattle

prove their superiority over other breeds subjected to trying conditions on the , by keeping in good flesh and filling the while other cows grow thin and reduce yield. You can prove this to your satis-on.

WN SWISS CATTLE BREEDERS' ASS'N
RA INMAN, Secretary, Beloit, Wis.
BOWER, Pres., Union Stock Yds., Cleveland, Ohio

NNOUNCEMENT

Kinnelon Farms, owned jointly by Warren & Morris Kinney and for thirty-four years the home of pure-bred Brown Swiss cattle, announces herewith a reorganization, change of name, ownership and location.

The entire herd will be moved this month, August, to Lees' Hill Farm, at New Vernon, N. J., with Post Office at Morristown, and will be known henceforth as the Lees' Hill Farm herd. Mr. and Mrs. Warren Kinney are the new owners, Morris Kinney having recently sold out his interest to them.

The management will be the same as heretofore and a constructive breeding plan for the improvement of type and production will be carried on. Brown Swiss breeders are urged to associate the name "Lees' Hill" with "Kinnelon". It means the same blood, backed by the same high records, and under the same intelligent management.

Herd fully accredited, Certificate number 65301

RIVER MEADOW FARMS, Portlandville, N. Y.

A YEARLY RECORD HERD

The Clover Lawn Farm Holsteins. 150 head. 60 cows with yearly records. 20 young bulls, one month to 2 years old for sale, sired by King Longfield Pearl Vale, whose dam made 1225 lbs. of butter 26,050 lbs. milk a year. Can spare a few choice young cows. State exactly what you want.

JOHN H. PULS - - ALLENTON, WIS.

Don't let "looks" rob your pocket-book

You can't choose oil or Black Valentine beans by "looks" alone

THESE bean seeds certainly look alike. They even come from the same family—Black Valentine. But one pile will grow fancy stringless beans which earn a good profit.

The other variety will grow just plain, stringy beans. It isn't safe to judge by appearances!

It costs even more to pick oil on looks alone. The poorest may look like the finest, and it is impossible to tell *from appearance* whether or not an oil is the right one for your motor. The eye can't detect the difference. But your motor can, and though it may not immediately complain, a poorer crop of power and a bigger crop of wear are as sure as tomorrow's sunrise.

Talk with any man, who doesn't judge by appearances, who buys *certified* seed and *pure-bred* cattle, and you'll find a man who uses good judgment in his treatment of automotive equipment. He will tell you that the cheapest oil may provide the most expensive lubrication, and that one unnecessary breakdown, one repair bill for prematurely-worn parts, will quickly wipe out any fancied saving.

A man of this type is very likely to use Mobiloil, because:

1. He refuses to be fooled by appearances.
2. He knows that no other company has *specialized in lubrication* as has the Vacuum Oil Company.
3. His judgment in selecting Mobiloil is backed by the approval of practically every manufacturer of automobiles, motor trucks, and farm tractors.
4. He is *sure* of getting the correct oil for each individual car, truck, tractor, or farm lighting unit.
5. He has proved that Mobiloil is the most economical oil to use.

* * *

Gargoyle Mobiloil is not a gasoline by-product. It is refined from crude stocks chosen solely for lubricating qualities. The Vacuum Oil Company has specialized exclusively in lubricating oils for over 58 years, and its recommendations are accepted as scientifically correct by engineers all over the world. Make the Chart of Recommendations your guide. You will obtain economical results from this certified oil just as truly as you obtain profit from the certified seed which comes from your experiment station.

GARGOYLE

Mobiloil

Make the chart your guide

VACUUM OIL COMPANY

Chart of Recommendations

(Abbreviated Edition)

THE correct grades of Gargoyle Mobiloil for engine lubrication of both passenger cars and motor trucks are specified in the Chart below.

How to Read the Chart: A means Gargoyle Mobiloil "A"; B means Gargoyle Mobiloil "B"; BB means Gargoyle Mobiloil "BB"; E means Gargoyle Mobiloil "E"; Arc. means Gargoyle Mobiloil Arctic

Where different grades are recommended for summer and winter use, the winter recommendation should be followed during the entire period when freezing temperatures are experienced.

The Chart of Recommendations is compiled by the Vacuum Oil Company's Board of Automotive Engineers, and represents our professional advice on correct automobile lubrication.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

olume LXVIII, No. 7 Fort Atkinson, Wisconsin August 29, 1924

PREFERENCE

RECENTLY a questionnaire was submitted to the senior students of various agricultural colleges who graduated in June of this year, asking them to express their preference for a variety of articles used by farmers. Among these were included cream separators and milking machines. Questionnaires were received from students in the following institutions:

Alabama Polytechnic Institute, University of California, Purdue University, University of Minnesota, Michigan Agricultural College, University of Missouri, Oregon Agricultural College, University of Georgia, Ohio State University, Cornell University, University of Tennessee, University of Illinois, West Virginia University, Penn State College, University of Nebraska, Iowa State College, University of Wisconsin.

82.3% preferred De Laval Cream Separators
60.9% preferred De Laval Milkers

Such expressions coming from these students who have had an opportunity of studying and using these products are a splendid indication of the remarkable preference shown for De Laval products.

EVER FAILING OR NEVER FAILING PASTURE

Part 9.

Cows Produce Well On Sweet Clover

WILBER J. FRASER, University of Illinois

Cows' production increase when they are turned on sweet clover pasture.

The last feed that a cow eats and makes into milk, above that required to pay expenses, yields the profit.

It encourages the cow to eat to her full capacity.

Sweet clover pasture, rightly handled, is a most satisfactory ration for economic milk production.

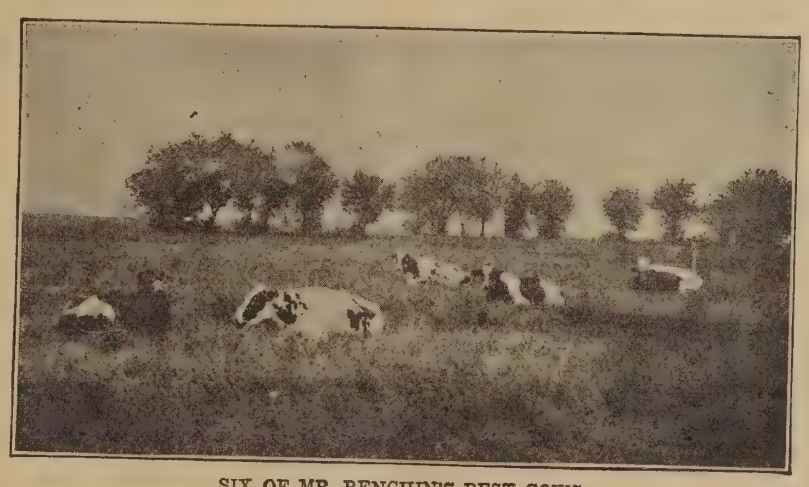
SWEET clover pasture saves land, labor, and the cow's energy, as the last three chapters have hown, but the most important thing t does, and the thing that any pasure crop must do to pass the first test n a dairy farm, is enable the cows o produce a good amount of milk. No matter how much feed a pasture rop provides or how long a season ver which it affords pasture, unless ne cow can produce a large amount f good milk from it, the crop is of ttle value to the dairyman.

The majority of the men answerng the questionnaire reported a ield of from 25 to 40 pounds of milk er day from their best cows when on veet clover pasture, and many of iese fed no grain. There is nothing the answers to indicate that the ws did not produce well, according their natural ability, stage of laction, and the circumstances of the se. Some of the dairymen made inresting statements that clearly incate a high production of milk from veet clover, as the following facts d quotations will show.

Significant High Yields of Milk

"My best cows produce 60 pounds milk on sweet clover pasture. I d an average of 11,000 pounds of lk for 10 months according to cow sting association records. Three of ese were two-year-olds."—Fred C. ieker, Southern Illinois..

"A cow that freshened September gave 60 pounds of milk per day on veet clover the latter part of Sepmber and the fore part of October. tried to feed my cows some grain t spring and summer while on eet clover pasture, but they ate so tle they wasted about as much as y ate. I would rather quit dairy- than be without sweet clover pase."—Albert C. Kolmer, Southern nois.



"I do not think there is anything t will equal sweet clover pasture milk production."—Jesse Payne, thern Illinois.

I had a heifer that was two years three weeks old when she freshd January 16, and she is produc- 32 pounds of milk per day on et clover pasture without grain at present time—June 26. This is pounds more than she was proing in April with grain."—Mr. ers, Northern Illinois.

eed Only Four Pounds of Grain

Many dairymen fed a little grain he sweet clover pasture, but four nds per cow per day was usually maximum reported. In fact this s much as most cows will eat if good sweet clover pasture. I vis- the herd of one of my former ents, Otto Kolmer of Southern ois, on May 28. His cows were on t clover pasture and he was feedthem all the grain they would up twice a day and it was just pounds per cow per day. There was a little grain left in every cow's manger when I was there.

Mr. Kolmer had a nine-year-old cow freshen December 29, 1923, and she produced on 40 pounds of silage, 13 pounds of alfalfa hay, and 20 pounds of mixed grain, 60 pounds of milk per day as her highest production. By the latter part of April, she was down to 46 pounds of milk per day. When she was put on sweet clover pasture, she came up to 50 pounds of milk per day and gave one day 52 pounds on sweet clover pasture and four pounds of grain, which was all of the grain she would eat. This is a most astonishing fact, for corn silage and alfalfa are the best roughages known for dairy cows.

SIX OF MR. RENCHIN'S BEST COWS

One of these produced 75 pounds of milk per day, and two others produced 60 pounds, on sweet clover pasture without grain.

Cows Increase When Turned on Sweet Clover Pasture

Most of Mr. Meyers' herd of 40 cows in Northern Illinois are fresh in the fall, and the following is the way twelve of his best cows produced during April, May, and June, showing how they came up in milk when turned on sweet clover pasture the last day of April. They received grain until April 30, but this was cut off when they were put on pasture.

Average Daily Milk Production Per Cow													
Cow	A	B	C	D	E	F	G	H	I	J	K	L	Daily ave. of 12 cows for the month
April	33	22	16	23	13	16	27	21	17	30	27	40	23.5 lbs. milk
May	34	18	22	23	14	18	24	25	22	32	35	37	25.5 lbs. milk
June	43	30	27	27	16	22	30	30	22	32	34	34	29.0 lbs. milk

These 12 cows were fed corn silage, legume hay, and grain and produced an average of 23.5 pounds of milk per day. The last of April they were turned out on sweet clover pasture and the grain was discontinued. The cows came up in milk production to an average of 25.5 pounds per day, an increase of two pounds, and again increased their production in the month of June to 29 pounds, or another increase of 3.5 pounds. They made an average increase of 5.5 pounds of milk—23 per cent—from barn feeding in April to sweet clover pasture in June.

Sweet Clover Was Better than Grain

In the spring of 1923, Mr. Ed. Rehling's cows were producing an average of 383 pounds of milk per day from the herd, and he was feeding the cows corn silage, alfalfa hay, and some grain. When he turned onto sweet clover pasture April 23 he quit feeding grain, and the cows immediately came up in milk. After they had been on the sweet clover 10 days, they were producing 525 pounds of milk per day, an increase of 142 pounds, or 37 per cent. On the barn ration the cows produced 25.5 pounds of milk per day. After they had been on sweet clover they produced an average of 35 pounds per day.

Mr. Rehling had one cow that produced 69 pounds of milk per day on sweet clover alone, without grain, in 1923. In 1924 the same cow produced 50 pounds on sweet clover without grain.

I believe the statements made above by intelligent, practical dairymen are not exceptions, but the general rule for good cows and that many more such cases would be found if the facts were given.

I have watched the production of cows on sweet clover pasture for a dozen years and have never seen a case where the production was not as good as could be expected, the quality of the cows considered. Wherever sweet clover pasture is rightly handled and properly supplemented for high production, I believe cows can not be fed a ration more satisfactory for economic milk production, when all the factors are taken into consideration.

When Jersey cows produce over 25 pounds of milk, or Holsteins over 35 pounds, they should be fed some grain on sweet clover pasture. When producing above these amounts for a long time and not fed grain, they will ultimately run down in flesh which will be detrimental to their production and best welfare later.

Sweet Clover Encourages the Cow to Eat Her Full Capacity

Since sweet clover pasture furnishes a constant supply of fine, green feed, the cow always has a good ration before her, night and day. She can get as much feed as she wants whenever she wants it, and this encourages her to *keep filled up to her maximum capacity all the time.* As it is the *last feed that a cow eats and makes into milk, above that required to pay expenses, that yields the profit,* the advantage of encouraging her to consume up to her limit is easily recognized.

Sweet clover pasture is good not only from the standpoint of high production, but also because it stimulates the cow *in the natural way* with good, fresh, green roughage to give a large yield of milk. It does not "burn out" the cow as does a heavy grain ration, but rather keeps her in the best physical tone because it is the kind of feed which she was designed by nature to handle over a long period of years, and thus tends to add to her length of life.

Marinette County, Wisconsin, has voted $600 by the county board to prepare a National Dairy Show exhibit. Among other things that will be shown is an exhibit of Italian cheese, this county being the greatest producer of this brand in the country. Charles B. Drewry is county agent.

A meeting of the board of directors of the National Milk Producers' Association will be held during the National Dairy Show, it is announced by Secretary Holman. A total of 22 separate producers' organizations will be represented.

CONTROLLING ABORTION IN CATTLE

B. T. SIMMS, OREGON

THE financial success of any dairy herd depends very largely upon good production. There are three principal factors which influence high production. These are breeding, feeding, and health.

The progressive dairyman of today has a very definite breeding program. He selects his herd sires with certain ideals in mind. He is a close student of pedigrees, blood lines, and inheritance. He can discuss with intelligence, inbreeding, line breeding, and out-crossing.

He is just as well informed concerning feeding. He knows the energy value of fats, carbohydrates, and proteins. He balances his rations with skill and plants his crops with their feeding value in mind. When he buys commercial feedstuffs he demands a guaranteed analysis and he sees to it that the state has chemists to check these analyses.

His attitude concerning the health of his herd is entirely different. He has no definite program for the control and eradication of any disease except tuberculosis. I doubt very much if he would have this if the milk-consuming public had not demanded it. While the dairyman knows in a general way that infectious abortion, white scours, garget, and sterility cause very serious losses, he has very little accurate knowledge as to the methods of preventing and controlling these disturbances of the health. This being true it is not surprising to find the health factor is very frequently the cause of financial ruin of progressive dairymen. Any person who is in touch with the dairy industry can recall many herds which have been ruined by either infectious abortion or sterility. These two troubles constitute the most serious health disturbances of dairy cattle. While there are many problems concerning these troubles that are still unsolved, we have at hand sufficient definite knowledge to enable the dairyman to adopt a program for prevention and control.

Facts Concerning Infectious Abortion

Abortion is a definite infectious disease of cattle caused by a germ called *Bacillus abortus* (Bang). It should not be confused with sterility as there are many sterile cows which are not infected with the abortion germ. This trouble exists in practically every section of the world where dairying is well developed. It is most prevalent in the older dairy sections where dairy cows are most numerous. It is impossible to give any accurate figures as to the percentage of infected animals. In Oregon we estimate, from having tested several thousand animals, that approximately 20 per cent of the cows are infected. The percentage would probably be some higher in the older dairy states.

The germ which causes this disease will not grow outside the animal's body but it will live for several months in dark, damp places. It is not so easily destroyed by drying as are many of the other disease-producing organisms. It lives and multiplies in the udder and in the pregnant uterus. Not every infected cow has the germs in her udder though. The diseased cow throws off the germs in large numbers at the time of aborting or calving and for several days thereafter. In most cases the discharge of abortion germs ceases before the 60th day after calving or aborting. If the udder is infected the germs will escape in the milk. The number passed off in this manner is small when compared to the number discharged at the time of aborting.

Some investigators have found the germs occasionally in the testicles and other genital organs of bulls. Abortion-infected bulls are quite rare, however.

How it spreads. Methods of spread of this trouble have been studied by several investigators. At the Oregon Experiment Station five possible methods of spread have been studied under actual dairy conditions. These are by the bull at the time of service, from the dam to the fetus during pregnancy, through feeding infected milk to heifer calves, through penning or pasturing unbred heifers with aborting cows, and through penning or pasturing pregnant heifers or cows with aborting cows.

In the experiments with bulls more than a dozen were used and above two hundred calves were sired by them. These bulls were mated with both infected and non-infected cows. In some instances a certain bull was bred to an infected cow during the morning and to an abortion-free cow during the afternoon of the same day. The bulls were never allowed to run with the cows. The infected cows were bred in a separate lot. No precautions such as flushing out the sheaths of the bulls were resorted to. In no instance was there any indication that any of these bulls spread abortion.

AEROPLANE VIEW OF JUNE-WAY FARM

This farm is owned by W. O. Washburn of Minnesota and it specializes in Holstein cattle and Swiss milch goats. Mr. Washburn is particularly enthusiastic over the milch goat business and reports ready sale of milk at 50 cents a quart.

In studying the possibility of an infected dam passing the disease on to her offspring, heifer calves born from infected cows were studied. They were kept under observation until the termination of their first pregnancies. During the period of study they were tested regularly for abortion. There was absolutely no evidence that the disease was transferred from the dam to her calf during pregnancy.

Approximately a hundred heifer calves were fed milk from abortion-infected cows. Occasionally during this test portions of this milk were injected into guinea pigs and typical lesions of abortion were produced, thus proving that the milk carried the germs. If the feeding of this milk was stopped before the calves were six months old, the disease was not established in such calves.

Unbred heifers exposed by penning or pasturing with aborting cows occasionally contracted the disease. The older these heifers were the more easily they seemed to be infected. Such exposures were usually negative even in heifers past breeding age.

Pregnant cows or heifers penned or pastured with aborting cows contracted the disease very regularly. Experiments extending over a period of eight years have shown conclusively that this is the usual method of spread of infectious abortion.

Symptoms. The act of abortion is only one of the many symptoms of abortion disease. It is the most spectacular of the group though and consequently is the one through which the owner most frequently makes a tentative diagnosis. According to studies at the Oregon Experiment Station it is very unusual for any considerable number of cows to abort unless infectious abortion is present. It is recognized, however, that there are some abortions not associated with this trouble. It is well established, too, that many cows infected with abortion will carry their calves full time and deliver them alive. Contrary to popular belief, infectious abortion may cause a cow to lose her calf at any stage of pregnancy. We have observed some cases as early as the seventh week after conception and others as late as the middle of the ninth month. Many of the early abortions pass unnoticed.

If abortion occurs before the sixth month the afterbirth is nearly always passed with the calf. If it occurs later than the sixth month the membranes are usually retained. The liquid passed at the time of aborting is a dirty yellowish color and contains many small semi-solid particles. There is frequently a characteristic and quite disagreeable odor.

Retained afterbirth, as previously mentioned, is a frequent symptom of abortion infection. This is seen many times in the infected cows that carry their calves full time and deliver them alive.

Garget is much more frequent in abortion-infected than in abortion-free herds. This trouble seems very prone to attack cows which have been infected with abortion a year or more. Very often, when we see herds in which garget is serious, the owner tells us that a year or more previously there was a bad outbreak of abortion among his animals.

Sterility so frequently follows abortion infection that many people consider it as a symptom. Like garget it occurs to some extent in abortion-free herds but to a much greater extent in the infected herds.

From an economic standpoint decreased milk production is the most serious symptom of this disease. It is generally known that the aborting cow does not come to her full flow of milk. Most dairymen do not realize that the infected cow which carries her calf full time will not usually come to her full flow. This is a fact, however. In herds where accurate records were kept we found that animals of the same age, type, and breeding, when divided into abortion-free and abortion-infected groups, would show about 25 per cent greater production in the healthy group.

Diagnosis. The symptoms are such that accurate diagnosis can not be made by studying them alone. There are two very reliable laboratory tests which are used in detecting this disease. They are known as the agglutination and the complement fixation tests. Of these the agglutination test is the simpler and it is the one in most general use. We have used this test at the Oregon Experiment Station under both laboratory and field conditions. After experience with many thousands of these tests we feel quite sure that it is very accurate. It will not determine just which animals will abort but it will tell which are infected and consequently are a source of danger.

Treatment. No successful treatment has been found. It is interesting to note the large number of treatments which have been brought out and advertised during the last few years. In spite of all these the disease continues to threaten the dairy industry. Bacterins, vaccines, and serum have been recommended and rather widely used. It is possible that the live organism vaccine possesses some merit but it is still in the experimental stage. It should be recognized that these live organisms are a possible source of infection and therefore they should be used with extreme caution. We know that infected animals occasionally recover but under average dairy conditions such recoveries are not frequent. The only safe thing at present is to consider an animal once infected always dangerous.

With the above facts available a program for abortion prevention, control, and eradication has been worked out. It has been demonstrated in Oregon herds that it will give results under practical dairy conditions.

A Program for the Disease-free Herd

The program for the dairyman whose herd is free from abortion disease is as follows:

1. Never add any female of breeding age to the herd until she has been tested for abortion. If females come from suspected herds isolate such animals and give them a second test after 30 to 60 days.

2. Before adding any animal to the herd give it an antiseptic bath, paying special attention to the feet, legs, belly, and tail. This is to get rid of any infection that might be on the skin.

3. Do not pasture any cows or heifers with untested cows or heifers.

4. Do not allow any stray cows or heifers on the premises.

5. On the show circuit tie the calves at one end of the string and the bulls at the other end. Take it up with the management of the show and if possible have the abortion-tested cattle housed in a barn separate from those that are not tested.

6. Test the herd annually for abortion. This precaution is as necessary

(Continued on page 165)

NEW YORK EXPERIMENT STATION JERSEYS

Twenty-three Years of Tuberculin Testing

A. C. DAHLBERG, NEW YORK

MOST dairy herds have had some experience with tuberculosis and the New York Experiment Station is no exception. The details of the infection and its eradication have been published in a bulletin by this station and several addresses upon the subject have been given by George A. Smith under whose supervision the herd was freed and maintained free of the infection. Last year the tubercular history of the herd was summarized and published in a recent popular bulletin and the information in this bulletin served as the basis of this article.

The establishment of a herd of Jerseys at this experiment station actually began in 1898 and 1899 with the purchase of fifteen cows from nine different herds in New York State. These cattle were carefully selected so that productive, healthy animals of good type would be obtained. They were not tested with tuberculin but their health was considered on the basis of their physical appearance. These animals, together with cows and eleven heifers raised the station, constituted the herd 1900.

During the fall of 1900, one cow had been purchased in 1898 lost ght so rapidly that her health rather doubtful. In November a l veterinarian examined her sically and pronounced her tu cular. She was slaughtered and nd to be infected with generalized erculosis. Rabbits which were inlated with the tubercular lesions milk from the udder developed eralized tuberculosis. It was evit that not only did this cow have erculosis but that the calves were g raised on milk containing ac tubercle bacilli.

hysical examination of the herd ed to detect any other cases of rculosis but there was little ot that other animals were infect For this reason all of the animals were more than six months of were given the tuberculin test. nteen of the twenty-eight animals he herd reacted. When post-mor examinations of the carcasses made in later years, the results he test were verified and found ect. Physical examination failed of any material value in detect the tubercular cattle.

he usual method of handling a rcular herd is to slaughter the ted cattle and replace them with hased or raised animals. The adbility of this procedure under age conditions cannot be questioned. A healthy herd of proper size was a necessity for experimental work at the station. The breeding of the diseased animals was especially good, and the expense of purchasing animals of equal breeding would have been rather great. To save this quality of breeding it was decided to replace the herd by the calves raised from both the healthy and the diseased animals. Therefore, in October, 1901, the herd was divided into a healthy herd and a tubercular herd. These herds were cared for according to the method originally devised by Professor Bang.

The tuberculin test record of the diseased herd, summarized in Table 1, is an object lesson for the present day in eradicating tuberculosis. It illustrates the danger of infection by the purchase of cattle from tubercular herds, even though the cattle pass the tuberculin test. This tubercular herd consisted of seventeen animals that had reacted to the test. One of these animals in October, 1901, did not react to the second test. In December, 1903, only two out of the remaining six tubercular animals reacted to the test. A total of sixty-four tests were made on the seventeen tubercular cattle and only fifty-three reactions were obtained. Examination of the carcasses of these animals and inoculation of rabbits with the lesions of some gave positive evidence that every animal was infected with the disease. The authorities in charge of the tuberculosis eradication work recognize this condition and it is largely responsible for their slogan "Once a reactor; always a reactor".

KING'S ST. LAMBERT FANCY

The first pure-bred bull owned by the Geneva Station. He is one of the few reactors to the tuberculin test that showed no lesions when slaughtered.

Table 1—Tuberculin Tests on Isolated Tubercular Herds

Date tested	Total number tested	Number of failures to react
1901, October	17	1
1902, June	14	0
1902, December	8	1
1903, December	6	4
1904, May	7	1
1904, November	6	2
1905, November	6	2
Total	64	11

This limitation of the tuberculin test has been frequently mentioned in the literature and is usually explained as being due (1) to failure of badly diseased animals always to react, and (2) to the encysting of lesions which actually separates the tubercle bacilli from the body tissues. These explanations do not interest the farmer so much as does the fact that these animals are or may become dangerous spreaders of the disease. Cattle should not only be given the tuberculin test before putting them into a herd free from the disease, but they should also come from tuberculosis-free herds if one wishes to take special precautions in protecting his herd.

The cattle that passed the tuberculin test constituted the healthy herd and were isolated and protected against re-infection by the diseased animals. Calves of both healthy and diseased animals were handled according to the Bang method and placed in the healthy herd. The tuberculin tests of the isolated healthy herd are given in Table 2. After six months of isolation, four more animals reacted to the test. They represent the animals that were exposed to the disease at the time of the first test and had contracted it before the second test.

In 1904 a cow reacted and when she was slaughtered tubercular lesions were found. This cow had been purchased the previous year from a tubercular herd, but she passed the test and was placed in the herd. Her history illustrates again the danger of buying animals from infected herds even though they pass the test. In 1905 another cow reacted to the test and was immediately removed from the healthy herd.

The healthy herd, which had been successfully raised from a diseased herd, had now increased to the desired number. The six remaining animals in the diseased herd were slaughtered in 1905, and all were found to have tuberculosis.

Maintenance of a Tubercular-free Herd

Too large a percentage of cattle owners have failed to recognize the fact that protecting the herd against re-infection is just as important as testing for tuberculosis. The natural tendency is to think that the work is done for all time to come after the herd has been tested and the diseased animals slaughtered. The belief that testing the cattle once a year and slaughtering any reactors would free any herd of the disease regardless of the general farm practices is erroneous. The literature on bovine tuberculosis contains numerous instances of failure under such conditions, while definite precautions for the prevention of re-infection are recommended.

The first tuberculin test on the Station herd after there were no tubercular animals on the premises was made in 1906. The results of the tests from 1906 to 1923, inclusive, are given in Table 2. A total of 673 tests were made during this period and only three positive reactions were obtained. Assuming that these three reactors were tubercular, the number of tubercular cattle in the herd has been a negligible quantity. Post-mortem examinations, although very carefully done, did not reveal any tuberculosis in two of the animals, and animal inoculation with their tissues failed to produce tuberculosis. It can be truthfully said that since 1905 there never has been a proved case of tuberculosis in the Station herd.

The first reactor was a bull which had passed the test in 1914 but gave a typical temperature curve in 1915. He was isolated according to the Bang method and kept for three years. He never gave another reaction, although tested in three subsequent years, and careful post-mortem examination failed to reveal any tubercular lesions. In 1919 a heifer born and raised at the Station gave a temperature reaction and was immediately slaughtered. No tubercular lesions could be found. In November, 1922, a three-year-old cow gave a very typical temperature reaction, but both the intradermal and ophthalmic tests were negative. Ninety days later she passed all three tests and a year later she gave negative results again. Whether the first two animals were tubercular can never be established beyond all doubt, but it is probable that they were healthy and the test was at fault with them just as it must have been at fault with the cow tested in 1922.

For the sake of argument it may be assumed that the test was at fault in all three cases. How accurate and reliable has this tuberculin test been in the Station herd? In the tubercular herd maintained from 1901 to 1905, it was not especially accurate, as it gave a false report in 11 out of 64 tests. The tuberculin tests selected out all the tubercular cattle from the general herd in two years, namely, 1900 and 1901, which is a remarkably fine record. In 1904 and 1905 it showed two other cows to be tubercular and lesions were found in their bodies. In 1915 and 1919, two animals that reacted were probably not tubercular, while in 1922 the test on one cow contradicted itself. Since the healthy herd was established in October, 1901, it

(Continued on page 166)

OXFORD CAREY B B

She has been tested with tuberculin for 13 years and has never reacted. When this picture was taken she was finishing a record in excess of 600 lbs. butter in ten months on two milkings per day.

Organizing New England Dairy Farmers

W. F. SCHILLING, MINNESOTA

I HAVE just read with unusual interest the three articles and the editorial relative to the New England milk organization, and I am deeply interested, for the success of one co-operative always helps another.

From the viewpoint of hard experience I see absolutely no excuse for having separately owned and federated plants as outlined in the minority plan. The Twin City Milk Producers' Association tried this plan and was quick to see that for efficiency it had to be abandoned in short order.

We were confronted at the outset by the fact that a bargaining organization was a fizzle and then the next step was to have at least two places to sell our milk,—either to the dealer or to butter, cheese, or other by-products. We had in our communities cooperative creameries on every hand and we immediately rented these from the local boards of directors and then thought we had our problem solved. It was solved for a few moments and that was all. Our rental basis was agreed upon by a disinterested board of appraisers who ascertained the value of the plant and we paid a rental on a basis of ten per cent per annum of such appraisement.

Our troubles soon started. First, at one plant a new boiler of a larger type was wanted. Who was to put it in? The owners of the plant held a meeting and nothing was done. They did not know where they were going to get the money to do the job and you know the result—nobody would do a thing. In the meantime the Twin City Milk Producers' Association was losing money for the lack of action on the part of the old creamery board.

The very next thing was a whey separator wanted at a plant that was making a lot of cheese. The cream in the whey would pay the running expenses of the factory. It cost $800 to get the separator. Who was going to dig up? Just nobody and this and a lot more local troubles in local communities made us see that the plants must be under one head and one management if immediate and efficient action was to be had.

We were operating eleven plants in this manner and eleven different boards to deal with. If we wanted to take a vat or cooler out of one plant where it was not in use to put it in another plant that needed it, the owners said "nothing doing" and as the board would not purchase the needed equipment we, to save waste, purchased the necessary machine and installed the same at our own expense. Then there was a feeling that no one knew which was "tother" and there never was the right feeling.

To us the remedy was to have a central ownership and in a short time meetings were held and the plants appraised for sale and stock in the Central was exchanged for stock in the plants and all outside stockholders paid off in cash.

Today we are operating two condenseries and thirteen as good creameries as can be found anywhere. An efficiency man looks after the machinery in all of the plants, which at the farthest are not more than seventy-five miles apart. The separators and vats and other machinery are interchangeable at a few hours' notice and thousands of dollars are saved annually by having all equipment under the supervision and ownership of one central head.

Each plant has its plant manager who is responsible to the central office daily for the make of the products of his factory and the accounting for the milk that goes through his plant. An expert of unquestioned ability is in charge of the manufacturing of our products and a laboratory takes care of the testing of all churnings of butter, cheese, condensed milk, etc. Thus central authority and central inspection and grading keep the local managers on their metal to do the best. Only the best grade of butter is made and is kept to a certain standard. Just how could such authority be delegated to a dozen farmer boards of directors and get results?

Our members in fifty-eight communities are served by one large truck that carries butter, cheese, etc., from place to place so that our 6,129 members may get their own products for their tables whether they are living next to a milk station or a cheese factory.

Mr. Cance, in his article, takes pains to mention the failures but forgets to mention the successes in the centrally operated plan. He mentions the Milk Producers' Association of Chicago. That never was anything but a bargaining organization and that and the Chicago Marketing Co. were always in a fight to see that neither did a thing for the farmers. The Dairymen's League of New York has only operated on the pooling plan about two years, and like at Chicago there is the anti-pool crowd doing everything possible to hinder rather than help to make a real low per cent marketing organization.

The centrally controlled has everything in its favor. What will happen if one of the groups gets it into its head that its big man should be the whole thing and others say no. This group immediately pulls up stakes and goes down to the market and offers milk at fifteen cents per hundred less than the big concern. Then what happens? The little bunch of antis makes the price for all the milk of the territory. The farmers soon lose hundreds of thousands of dollars all because they do not co-operate to save their industry.

Mr. Cance also states that "the open price associations have brought about much more satisfactory conditions in the trade in many instances." Why shouldn't they? They harm no one. The dealer does not fight them as they are harmless and toothless. If the dealers told them that they would give them $1.50 per hundred for their milk they would have to take it or drink their milk. The dealers always encourage such organizations as they take the place, temporarily at least, of real marketing organizations.

The oldest and, pardon me if I say it, the most successful milk marketing organization in America is the Twin City Milk Producers' Association. It will be eight years old in September. It has been through the mill. It has been handling over twenty-five million pounds of milk a month this summer. It has proven its worth to the producer, consumer, and distributor alike. It is under central control and would not go back to the local control under any conditions.

Isn't it with great local pride that the producers look upon a local milk plant, though it be owned by all the farmers of the milk territory? Isn't it the best thing in the community? Won't it insure the farmer a steady market for his product? Isn't he independent of any distributor? It can not be moved and no matter what happens to the Central in after years isn't it the property of the community?

I have visited two hundred and fifty-five cities in America of over ten thousand population. I have studied conditions about all of them with one thing in mind—milk marketing. New England is no different than all the rest. Her problems are the problems. A central control organization will work in New England if the farmers there want it to work. Eighty per cent will get behind on contract, use what plants they have at present, and augment these with others as conditions warrant and get out and shout for the cause, it will win. I would not be afraid of the milk dealers; it is the farmers who always spoil their own game.

If unselfish leadership will work for the cause of the milk producers in New England, and I believe they will and suspicions and jealousies are put aside for a few years, I have no fear of the result.

Unfair Overrun Competition

The Twin City, Minnesota, Milk Producers' Bulletin gives the following good discussion of the unfair competition put up by creameries that claim excessive overrun:

"The most difficult thing we have to deal with in the butter part of our business is unfair competition from creameries that are paying more than it is consistently possible to pay. Take, for instance, the month of June in which we paid 45c for butterfat. Some creameries paid more than this. Now here are the figures. The average for 92-score butter in New York for the entire month of June was 41.4c. The average overrun which it is possible to receive, according to the Albert Lee State Creamery, is about 22%. Adding 22% to 41.4c, we have a total of 50.5c, which is the highest possible price under actual creamery conditions that could be received for butterfat in the form of extra butter delivered New York.

The average transportation charge from our creameries to the market is 1.8c. The making, which includes the running of the factory, tubs, power, etc., costs 3½c per pound and there is a selling charge of ¼c per pound. This makes a total charge of 5.55c per pound of butter made and delivered on the market. Subtract this from 50.5c, the average price paid for good butter, and you have 44.95c.

"This assumes that there is no mechanical loss in separating milk and it is a well known fact that all skimmilk contains at least 7-100% fat when it is properly tested. This also assumes that every pound of the butter is 92-score and that it is all delivered in carload lots at the lowest possible rate under ideal conditions.

"We were able to pay the 45c only because part of our butter sold at a premium over 92-score butter. Some of our butter scored 93 and some 94, and on this we had a premium, which allowed us to pay 45c per pound.

"If any creamery paid more than this, it must have had a better outlet for butter than was afforded by the Minnesota Co-operative Creameries Association, representing over 400 creameries, or else it secured an abnormal overrun by improper weighing and testing. Many buttermakers brag about securing from 25% to 30% overrun. It appears that the American farmer likes to be buncoed. He is looking for the highest price regardless of honest dealings, on both milk and cream, and there is naturally a great temptation to give him what he wants.

"Our average overrun for the entire year will be just about 22%. We know that if it is less, we are inefficient, and if it is much greater, that there is something wrong with our methods."

Colorado Holstein Breeders' Meet

Pat Donley's Deer Lodge ranch, near the village of Larkspur, Colo., was the scene of a good time Saturday, August 2nd. The occasion was the event of the Colorado Holstein breeders' annual basket picnic.

Long before noon parking space was at a premium on the picnic grounds. Over 200 people were present from every corner of the state.

The big event of the day was a drawing for the registered Holstein heifer that was furnished by the Colorado State Association, bred by the Colorado State Home, and was out of an 18-lb. two-year-old daughter of their great proven bull, Prince Ormsby Lad. This was an excellent calf and was won by Dr. Geo. H. Carr, vice-president of our state association. He immediately donated it back to the association and it was once more drawn for and this time won by Miss Ilda Churnside.

The board of directors also held a very important business meeting and a number of important things were passed upon for our program for the next six months. One of these was the decision to hold a stock show sale at the National Western Stock Show next January of about twenty-five or thirty high class animals that are from good record cows and are fit to show individually. This sale will be held under the auspices of the association and a committee was appointed to select the cattle.

The board instructed the secretary to have a Holstein booth at our State Fair at Pueblo and also at our National Western Stock Show in Denver. It was decided to continue our advertising and the secretary was instructed to give $50 to the State Fair for boys' and girls' club work.

PAUL V. PATTRIDGE, Sec'y.

National Dairy Show Prize

A total of $28,000 in prizes will be offered the winners this year, in addition to ribbons, cups, and special prizes offered by associations and individuals. Among the specials offered are four trophies by the American Guernsey Cattle Club, including the G. G. Hartley silver cup and the Peer challenge cup. John Bell, Jr., has offered a $1,000 bronze trophy to be awarded for the best three generations of Holstein females, regardless of age. Mrs. Nellie Fabyan, Illinois, has offered three prizes totaling $175 in gold to herdsmen, in addition to three medals offered by the National Dairy Association.

Entries are now being received in the office of the Dairy Show. The entries will close on Sept. 6, and those not in the mail by that time will not be accepted. Grade cow entries will close on the same date.

Cow Testing Associations

Association Notes by Testers

Blue Earth Co. No. 1, Minn.: Sixteen cows were culled during July. One new separator was purchased. Four cream cooling tanks were installed. The creamery paid 44—46 cents per lb. for fat.—E. L. Smith.

Martin Co. No. 2, Minn.: One member purchased a new separator. Another purchased a milking machine. Corn and alfalfa are growing very well. A number of members are feeding grain where pastures are short. The creamery paid 46 cents per lb. for fat in July.—H. A. Anderson.

Floyd Co. No. 1, Ia.: The high cow, owned by John Binger, produced an average of 40 lbs. fat last month. The 314 cows tested in the association averaged 27 lbs. fat. Eight farmers fed grain and many more should. Two new separators were bought in July. Fourteen farmers are spraying cattle. Milk sold to the ice cream plant brought $2.40 per cwt. The condensery paid $1.50 per cwt. Milk retailed for 10 cents per quart.—J. B. Day.

Fayette No. 1, Ia.: A few new silos are ready to be filled this fall. One farmer installed a milking machine and is buying more cows. There are 9 milking machines in use on the route.—C. White.

Jefferson Co., Ia.: All separators were found to be skimming satisfactorily. Herds fed grain averaged 27.38 lbs. butterfat; those not fed grain, 22.44 lbs. The creamery paid 42½ cents per lb. for fat.—O. Constable.

McLean Co. D. I. A., Ill.: Sudan grass for summer pasture is being tried by several members who find it quite satisfactory. However, care should be taken to allow the cows to be on it only long enough to eat and kept out entirely in wet weather as they tread it up and waste considerable.—H. R. Fletcher.

Washington Co., Kans.: Native pasture is becoming poorer and farmers are falling back on sudan grass for late summer pasture. The co-operative creamery again paid 7 cents above station prices for fat and maintains its own fleet of trucks to gather the cream. Fred Stigge, who has a herd of 8 registered and grade Holsteins, had the high herd average for July of 45.6 lbs. fat. The co-operative creamery paid 35 cts. per lb. for fat; stations, 27 cents.—H. G. Lenhert.

Tri-Co., Ohio: The average production of 220 cows tested in July was 645.6 lbs. milk and 31.8 lbs. fat. One member began Register of Merit testing. Most of the milk in this association is retailed locally. The corn crop in this section is late and must be put in silos to be saved from the frost. Market milk sold for $2.30 per cwt.; 20% sweet cream, $1 per gallon. Milk retailed for 15 cents per quart.—E. A. Mizer.

Columbia, Ore.: Production is low owing to continued dry weather. Market milk sold in Portland for $2.10 per cwt. and retailed for 10 cents per quart. The cheese factory paid 44—46 cents per lb. for fat; the creamery, 38 cents.—W. T. Noble.

Stanislaus, Calif.: This is the first month of testing in this association since the foot and mouth epidemic hit this county. Feed is short in the heavy dairy sections and prices of feeds are very high. Butterfat in whole milk is 50 cents by the M. P. A.—F. Lieberam.

Hamlin, S. Dak.: One member erected a silo. Four defective separators were found. Two herds were tested for T. B. One member and two of his neighbors signed the accredited herd agreement to have their herds tested for T. B. The creamery paid 36 cents per lb. for fat. Milk retailed for 8—10 cents per quart.—F. E. Hanson.

North Allegan, Mich.: Small grains and hay are excellent in this section.

(Continued on page 163)

Let's talk it over, say the members of the Middleton, Wisconsin, Cow Testing Association as they gather with their families for an association picnic on the farm of August Krey. And so the good done by this organization is multiplied. On the program were K. L. Hatch and A. J. Cramer of Wisconsin College of Agriculture. Judging contests for adults and calf club members were held.

Spend a Week in Dairyland

Daily Program of Events:

SATURDAY, SEPTEMBER 27TH—
Exposition opens at Fair Grounds.
College Students' Contest in Judging Dairy Cattle.
Factory Machinery and Supply Exhibit opens. Milwaukee Auditorium. 10 A. M. Free to Public.

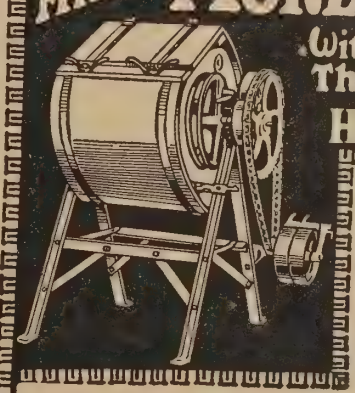
MONDAY, SEPTEMBER, 29TH—
College Students' Contest in Judging Dairy Products.
Boys' and Girls' Contest in Judging Dairy Cattle.
Grade Cow Judging.
International Association of Milk Dealers' Convention opens.
American Dairy Science Association Meeting.
City Milk Dealers' Day.
National Farmers' Cattle Judging Contest.

TUESDAY, SEPTEMBER 30TH—
Guernsey Cattle Judging, Fair Grounds.
Grade Cow Sale begins.
National Creamerymen's Conference.
International Assn. of Milk Dealers' Conference.
American Dairy Science Assn. Banquet.
Creamery Operators' Day.
Dairy Pioneers' Day.

WEDNESDAY, OCTOBER 1ST—
Holstein Cattle Judging, Fair Grounds.
International Association of Milk Dealers' Convention closes.
American Dairy Federation Meeting.
Cheese Factory Operators' Day.
National Cheese Ass'n. Meeting.
Illinois Day.
National Dairy Farmers' Conference.
Milwaukee Day.

THURSDAY, OCTOBER 2ND—
Jersey Cattle Judging, Fair Grounds.
Ice Cream Factory Operators' Day.
Ice Cream Manufacturers' Meeting.
Michigan Day. Minnesota Day. Wisconsin Day.

FRIDAY, OCTOBER 3RD—
Ayrshire and Brown Swiss Cattle Judging begins at Fair Grounds.
Judging Boys' and Girls' Club Calves.



SATURDAY, OCTOBER 4TH—
Final Day.

MAKE MORE MONEY FROM YOUR MILK With The MINNETONNA HOME BUTTER MAKER

There is always a big demand in every town and city for good butter made on the farm. It can usually be sold as soon as made at a premium of 3c to 4c over the market price. With the Minnetonna Home Butter Maker you can make the finest butter for which you will find a ready market, and make more money from your milk and cream.

The Minnetonna not only churns the butter, but works it in the machine. Electric motor (¼ H. P.), gasoline engine (1 H. P.) or hand crank drive. Will churn 12 gallons of cream or less. Works 3 to 20 lbs. Large sizes up to 100 lbs. capacity.

Write for free booklet.

Dealers should write for our special proposition

THE CREAMERY PACKAGE MFG. COMPANY
Creamery and Dairy Machinery and Supplies
68 W. Kinzie Street, Chicago

Women!

Have Beautiful Wool Filled

COMFORTERS

Buy pure wool comforter batting direct from the mill and be assured of the finest wool filling money can buy. You save money buying this way. Guaranteed 100% all wool. Made in full comforter sizes; all weights.

Write for Prices and Free Sample

Your Old Wool Comforter Made Like New!

We will recard your old wool into sheets the full size of your comforter, making them soft and downy as new. Charges: 25 cents per pound; washing, 8 cents per pound.

SEIFERT MILLS, Jefferson, Wis.

Make Your Roofs Last a Lifetime!

Positively that! The wonderful Seal-Tite method renews, preserves, and makes your old, wornout roofs watertight. Guaranteed for 10 years. Write today for this great money-saving roofing offer.

NO Money Asked

We send you everything you need to stop all roof leaks without asking a single penny. No C. O. D. No notes. No obligations of any kind. No such liberal offer has ever been made before.

Write! Don't put off another day finding all about this wonderful way of solving all your roof problems. We'll make you an offer so liberal, so clear, so surprisingly unprecedented that you simply MUST take advantage of it at once. Hurry up. It may be withdrawn any time. Write for it TODAY!

Monarch Paint Co. *Established 1903* Dept. C-985 Cleveland, O.

G-D Sanitary Seamless Strainers

Improved filter removes dirt. Solid drawn steel. Easy to keep sweet and clean. Full twelve-quart capacity. Will last a lifetime. "Send no money. Pay $2.00 and postage on receipt. *Money back if not satisfied.* Write for our free Dairymen's Supply Catalog.

CORN HARVESTER cuts and piles on harvester or windrows. Man and horse cuts and shocks equal Corn Binder. Sold in every state. Only $25 with bundle tying attachment. Testimonials and catalog FREE showing picture of Harvester. PROCESS MFG. CO., Salina, Kan.

EDITORIAL COMMENT

THERE is an old Yankee saying which describes false economy by telling of certain people "who would skin a flint for a sixpence and spoil a knife worth two shillings". Dairy farmers who keep twenty cows on starvation rations when ten good cows properly fed would produce as much or more milk as the twenty cows poorly fed, belong to this class.

FREE PRESCRIPTIONS

It is rather amusing to find men in the city prescribing for the ills of agriculture. Merchants and manufacturers, many of whom have no idea as to what constitutes good farm practices, are offering advice to the farmer and admonishing him in some of what they consider extravagances. Not long since a merchant declared the farmers' conditions would be better when they milk more cows, diversify more, and drive fewer automobiles.

There is a lot of bunk in this kind of advice. It is true, taking it by and large, farmers that diversify are the ones who make the most money and that it is the safest and best system of agriculture to follow. We do not consider it wise at the present time to enlarge our present number of cows but we rather believe it is in order to sell some of the poorest ones to the butcher and feed the remaining ones better.

As to automobiles, what class of citizens is more entitled to an automobile than the people who live in the country? The average city man has to drum up excuses oftentimes for buying a car when he can't afford one. The farmer's occupation is such that unless he is too heavily in debt he is justified in borrowing money to buy himself a car. He and his family are entitled to it. It is not a luxury on the farm but comes mighty close to being a necessity. Without doubt some farmers have bought more cars than they should and a few, perhaps, have been so situated that they shouldn't have bought a car, but to hold that agricultural conditions would be improved if the farmers would deny themselves automobiles is just plain, unadulterated bunk.

THE COW DID IT

Elsewhere in this issue we publish a brief story of the New Salem circuit. It is a history of a group of farmers who settled at New Salem, North Dakota, in 1883, when North Dakota was still a territory. These men felt that wheat growing in this section of scant rainfall was too uncertain and they soon began to milk cows. In 1896 they built a creamery and from that time to this its doors have been open. In 1910 they formed a cow testing association and later a bull association. Through organization these men have built up a strong agricultural community. They have developed a community spirit, they have learned how to co-operate, and the advantages which have come to them have been all that the most ardent advocate of co-operation could conceive.

It will be noted that the average gross income of the members of this New Salem circuit for 1921 for butterfat amounted to $1,107.91, over $1,000 in 1922, and $1,621.95 in 1923. There are herds in this circuit that produced in 1923 on an average of 410 lbs. fat per cow. The value of applying the scale and the Babcock test to every cow in the herd is shown by the improvement which one member's herd has made during the past fourteen years. In 1910 this member owned 17 cows that averaged 131.9 lbs. fat for the year. The return per cow above cost of feed averaged $16.90. In 1923 twelve cows averaged 303.4 lbs. fat and returned, above cost of feed, $82.74 per cow. In other words, the profits of one cow in 1923 were almost equal to 4 cows in 1910.

Read the brief story of the New Salem circuit which has been prepared under the supervision of Professor J. H. Shepperd, organizer of the circuit and chairman of the Animal Husbandry Department of the North Dakota Agricultural College.

NATIONAL DAIRY SHOW

The National Dairy Exposition, which will be held in Milwaukee September 27 to October 4, will have one of the best educational exhibits ever presented to the American dairy farmer. More attention is being paid to the grade cow and the importance of selecting good cows than at any previous show. Mr. A. J. Cramer outlines three interesting and educational exhibits which will be made by the Wisconsin Dairymen's Association at the National Dairy Show. They are as follows:

No. 1. A registered Holstein bull, named "Cedar Lawn Canary Paul 6th", 10 years old, will be exhibited with 10 of his registered and grade daughters that have produced 1,758 lbs. more milk and 84 lbs. more butterfat per year as heifers than their dams as mature cows. The expense of this exhibit, taken from members' herds in the Allenton—Kohlsville C. T. A., will be borne by the Holstein-Friesian Association of America.

No. 2. A group of six cows representative of a varying production, as follows: 1. The average U. S. cow with 160 lbs. fat; 2, the average Wisconsin cow with 190 lbs. fat; 3, the average Wisconsin C. T. A. cow with 273 lbs. fat; 4, the highest Wisconsin C. T. A. average cow with 341 lbs. fat; 5, the highest Wisconsin C. T. A. herd average with 534.5 lbs. fat; and 6, the highest producing Wisconsin C. T. A. cow with 839 lbs. fat.

No. 3. A group of ten grade Guernsey and Jersey cows showing that continued testing pays over a period of 3 or more years' membership in a C. T. A. is likely to be on exhibit. This herd's average was increased from 265 lbs. fat to 395 lbs., or an increase of 130 lbs. more fat per cow.

ORGANIZING NEW ENGLAND DAIRY FARMERS

On page 150 of this issue will be found a communication from Mr. W. F. Schilling, president of the Twin City Milk Producers' Association of Minnesota, pertaining to articles which we recently published regarding plans of organizing the New England dairy farmers. He points out the success of the Twin City Milk Producers' Association and holds that it is essential that a co-operative marketing company, handling fluid milk, should own its plants rather than have them owned by the farmers who take milk to them.

We have supported and approved the plan of organization of the Twin City Milk Producers' Association and have held it to be one of the very best plans of organization in the country. It was formed chiefly for the purpose of serving the producers who supply Minneapolis and St. Paul with fluid milk. It owns its creameries, cheese factories, and condenseries which we consider sound, for through them the surplus milk can be taken care of. We do not believe these institutions should be owned by a group of farmers within the organization but rather by the producers' association formed about a city for the purpose of handling and marketing their milk.

But, there is a heap of difference between an association which cares for the milk supply of a city produced by a few thousand farmers and a state-wide organization consisting of 125,000 to 150,000 members and which must take care of all the milk used for direct consumption and for making butter, cheese, etc. One is a relatively small unit capable of being managed economically, and the other is a very large organization covering a wide territory with numerous conditions and various opinions to deal with. The leaders in dairying in Minnesota have recognized this and Mr. Schilling is one who has favored the plan of federating the local co-operative creameries of Minnesota and operating the Twin City Milk Producers' Association as a separate unit.

We see no reason why the farmers who produce milk for Boston and the other large cities in New England should not each form an organization similar to that of the Twin City Milk Producers' Association and let the creameries in Vermont and in other states of New England form a federation upon the same plan as is followed in Minnesota. While the dairy industry of New England is not quite so large as that of Minnesota, it is big enough, to our way of thinking, to warrant organizations comparable to those of Minnesota. There is no disagreement between Mr. Schilling and us concerning the plan of organization of the Twin City Milk Producers' Association and the plan of organizing the creameries of Minnesota. Mr. Schilling holds that conditions differ in the New England States with those in Minnesota and therefore a central organization is the better one to form.

Let us make a comparison between Minnesota and the New England dairy industry. Minnesota consists of a little more than 87,000 square miles of territory and New England a little better than 67,000 square miles. According to the 1920 census report, Minnesota has 144,948 farms keeping dairy cows and New England, 124,024 similar farms. Reports show that in 1923 Minnesota had 1,641,000 cows and New England, 1,084,000 cows. The Twin City Milk Producers' Association has 6,129 members and occupies a comparatively small territory around the Twin Cities.

The only difference between our method of organizing the dairy farmers and those who would form a centralized plan is that we would form a strong co-operative marketing company around each city and on the plan of the Twin City Milk Producers' Association. We would then proceed to federate these various groups into one organization; then federate the local creameries and the local cheese factories, but each in separate organizations.

We are not opposed to the centralized form of organization but we prefer the local organizations federated into groups, as we believe this system of bringing the producers together is more likely to succeed than the centralized form of organization. When we build a business unit beyond a certain size, it becomes too large and unwieldy to handle efficiently, especially when it covers a territory with innumerable conditions to meet. We know the history of the Twin City Milk Producers' Association and that it took all of the management that could be mustered into service to bring it to its present enviable position. It has only 6,125 members out of the 144,000 men keeping cows in Minnesota. The Minnesota Co-operative Creamery Association is likewise using all the talent it can secure to federate about 400 of its six hundred and fifty odd co-operative creameries for the purpose of mutual benefit and to make a uniform quality of butter and to market it. These two organizations, the Minnesota Co-operative Creameries' Association and the Twin City Milk Producers' Association, do not encompass more than half of the dairy industry of Minnesota.

To summarize:

To organize the farmers of each state, we believe the local co-operative creameries should be federated into groups similar to the plan in Minnesota and the local co-operative cheese factories federated in a similar organization. Then the co-operative milk marketing associations can be formed around each city and these can also be federated. When several states shall have so organized the various branches of its dairy industry, there is no reason, then, why there cannot be formed a federation upon a national basis. We desire the same results as those who would form state wide organizations on a centralized plan but we believe we are more likely to succeed through the formation of local co-operative institutions federated than by any other plan which has been suggested.

We must not forget that not one-half of the dairy farmers in any state, unless it be Minnesota, desire to join any co-operative society, and this is a strong reason for building state-wide organizations upon local units federated.

Ice Cream Recipe

I wish a recipe for good, rich, home-made ice cream that is hard enough to stand up for use in a roadside stand. I have been using the following recipe for 2 gallons: 2 qt. of 30% cream, 8 eggs, 3 lbs. sugar, 1½ qts. milk, ½ oz. Knox's gelatine, flavoring to suit taste. The cream is not hard enough. What shall I change? Shall I use less cream or more gelatin? Is there anything cheaper or better than gelatine which costs 25c per oz.?

Knowlesville, N. Y. J. H. P.

The above mixture will not give an unusually rich, home-made ice cream as your correspondent indicates. This mix has a fat content of about 11%. The complaint that this ice cream does not stand up well enough can be remedied partly by increasing the fat content and partly by increasing the amount of gelatine.

I would suggest that in this mixture you use 2½ to 3 quarts of 30% cream and correspondingly less milk. The gelatine should be increased to ¾ oz., or if that does not give a firm enough ice cream, increase it to 1 oz.

The price paid for the gelatine, namely 25c per oz., is very much too high. Gelatine can be bought from gelatine manufacturers at a price in the neighborhood of 50c per pound, varying with the grade of the gelatine bought.

Wis. College of Agriculture. H. H. SOMMER.

Purchasing Tuberculin

Can tuberculin be purchased by farmers the same as vaccine for hogs? If so, where? If not, why not?

Cleveland, Wis. R. S.

Tuberculin and other biologics can be purchased by farmers at drug stores, from mail order drug houses, and certain biological manufacturers. However, many of the reputable biological firms will not sell to the laity. In the state of Wisconsin there is a law that requires every house selling tuberculin to be delivered within the state to report such sale, the kind of product, and the amount to the state veterinarian of the state.

In regard to shipping tuberculin interstate, the federal law specifies that it must be manufactured by a house that is under federal supervision and certain certificates shall accompany the shipment and be attached to the bill of lading. But there is no federal or state regulation against the farmer using tuberculin in Wisconsin.

However, when one understands the uses and abuses of tuberculin, we cannot conceive why any breeder or farmer would wish to be charged with the responsibility incident to its possession and use. He should take into consideration that possibly his motives would be impugned. We know that the use of tuberculin has led to certain abuses, such as plugging cattle against the test, and many feel that people who test their own cattle obtain a private survey, and often dispose of animals that may be reactors or suspicious to the test, other than through the regular channels; in other words, they are sold in the open market.

Every state in the Union at the present time is co-operating with the federal government on the tuberculosis eradication project, and anyone who desires a survey made on his herd relative to the existence of tuberculosis, may have competent and reliable service by petitioning the state or federal department for a test and placing his herd under federal-state supervision. This, without any cost to him; therefore we cannot see why anyone, other than those charged with the responsibility of administering tuberculin, should desire to use it.

There may be laws governing the use of tuberculin by the laity in some states.

JAMES S. HEALY,
Inspector in Charge Tuberculosis Eradication.

Milking Machine Teat Cups

Which type of milking machine teat cup is giving best results, plain or rubber lined? Which type is best on the cows?

Kenton, Ohio. R. P. J.

Milking machines have now been in practical and successful operation a long time. Many improvements have been made and milking machines are now considered a success, providing they are used on cows suitable for milking machines and they are operated by a person who understands the cows and the machines and knows how to intelligently co-ordinate them. Milking machines must be kept sanitary and the plant must be kept in good mechanical order. When these points are observed, milking machines will perform a final service for the dairy farmer who keeps at least 10 or 15 cows in milk all the time. For additional information, I would refer you to the different bulletins published on milking machines.

Within a certain range, no one type of teat-cup can be said to be the best. If everything is right and the plain cups are of the right size and the cow is not too hard a milker, equally good results will probably be obtained with the plain cups as with the rubber lined. Under all conditions, the rubber lined teat cups will give better average results than will the plain cups. Plain cups will do as good work under ideal conditions, but the rubber lined cups will do better average work under all conditions. Mechanically speaking, there is more action to the rubber lined cups than there is to the plain ones. This action on the side and end of the teats is so co-ordinated with the needs for milking that it gives the rubber lined cups some advantage.

The above statement is made on the assumption that the rubber lined cups are properly constructed in the first place; that there are no leaks in the rubber lining; that it is kept sanitary, and that the pulsator is properly set or adjusted in the machine wherever adjustment can be made. If there should be a leak in the rubber lined cups, if the inner rubber be old, hard, and cracked, and if the pulsator does not work properly, the rubber lining may become an actual damage to a milking machine; and under such circumstances a plain cup of the proper size and properly fitted to the cows will undoubtedly be better.

Broadly speaking, rubber lined cups, when in perfect shape, will give better results under the ful range of conditions than will plain cups.

As to which type of teat cup is the best on the cows, my experience is that either kind works satisfactorily; especially if the cow is an easy milker. With hard milking cows and with plain, hard cups, I think there is danger of forcing the teat completely into the teat cup in such a way as to prevent release. This condition is likely to stop the circulation of the blood and to produce a hard, fleshy condition and soreness at the end of the teat, and it is likely to wedge the teat so as to prevent free milk flow.

South Dakota College of Agr. C. LARSEN.

Mowing Weedy Alfalfa

Early this spring I plowed a tract to sow to Grimm alfalfa. Each week I disked and rolled the ground and a month before I seeded it I put on a thousand pounds of ground limestone per acre. I seeded it the 22nd of May without a nurse crop. I have a very good stand of alfalfa, but the wild morning-glory and lambs quarter or rag weed are covering the ground and I am afraid that they will smother out the alfalfa. Would it injure the alfalfa to mow it with the weeds in July?

Kalama, Washington. R. M. L.

I do not think you need to be unduly concerned about the heavy growth of weeds which is beginning to appear in your field of alfalfa. Young alfalfa will stand a very heavy competition with weeds, although it is very possible that weeds may become so thick as to smother out alfalfa. In your case, I think I would allow the weeds to grow until there has been some signs of blossoming. Then I would cut these weeds and on account of the morning glories, I think it would be well for you to cut them rather close to the ground. I am not acquainted with your weather conditions, but would suggest that if possible try to cut off the growth of weeds at some time when the cutting will be followed by rain to help give the alfalfa a new start. This is not entirely necessary, but I think it a happy circumstance to have rain follow the weed cutting process.

If the growth of weeds is very heavy it will be necessary for you to rake them up and haul them off the field. They can be left to dry, after which they are more easily handled. If they are not exceedingly thick they can be allowed to remain on the field but in those places where the surface of the ground is covered thickly the cut growth should be removed.

In many places where foxtail and barnyard grass give serious trouble, as is true throughout the middle west and eastern states, cutting close to the ground is quite essential to ward off a second growth of these common weeds. However, we must remember that cutting alfalfa the first year is not particularly beneficial. If anything, it is rather harmful and where the weeds are not too thick so as to seriously crowd the alfalfa, cutting is not advisable. It is a case where one has to use his own judgment, bearing in mind that only the real heavy growth of weeds is apt to crowd out and smother alfalfa. An ordinary sprinkling of weeds throughout the field is not apt to cause a great deal of harm.

In your case, as previously stated, I think that it will be advisable to cut the weeds, setting the mower bar high enough to get as much of the weeds and as little of the alfalfa as possible.

L. F. GRABER.
Wisconsin College of Agriculture.

Alfalfa Experience in Kansas

HOARD'S DAIRYMAN:—I consider the discussions on the growth and curing of alfalfa as one of the best series of articles you have published. Old alfalfa growers may need no instruction and to them the articles may not appeal. The new growers, however, can profit from these discussions and possibly save much loss by experimenting.

I first learned of the value of alfalfa many years ago from a distant neighbor who used it as a sole feed for his beef cattle and they were always in the best of condition. It was some 25 years ago that I seeded my first land to alfalfa. I sowed the seed the middle of August, using 20 lbs. of seed to the acre. Although I used no inoculation or manure, I secured a fine stand and cut considerable hay the following year, and the second year it grew a great crop.

The first year we cut it and allowed it to lie in the swath several days so as to get the juice out of the stems. The result was our hay was nearly leafless and was much like straw. However, the next winter the sheep preferred it to any other feed we then had. We then read Joe Wing's suggestions as to cocking it, but we made the cocks so large that they molded inside and after a big rain we tore the cocks apart and later put the stuff in a stack just to get it off the ground. We thought it was no good, but the lambs ate this hay readily and called for more. We salted this hay and it came out of the stack not half as bad as it looked when it went in. Someone has said you can't ruin alfalfa no matter how you handle it, and we began to believe this was so and increased our acreage to 20 acres.

We bought a side delivery rake, hay bucks, and and a swinging stacker. After the hay had cured a bit, we put it in the stack. Sometimes we would decide to make good hay and we would cock up some of it green. Rain would come and we decided that the cock wasn't worth while. Then we were told to make the cocks small and the result was a good quality of hay, even when the rains came.

Finally we concluded we knew just how to make good hay. We would usually cut the first week in June, usually mowing in the afternoon. The next morning, as soon as it was well wilted and the dew was off, we started the side delivery rake. After dinner we started a dump rake, bunching the hay in small bunches, not bringing the rake to the ground too quickly so as to leave 3 or 4 feet not bunched by the rake. My neighbor and I found that following this practice the two of us could cock 10 to 12 acres in a half day. We would then cut down more hay and forget about what we had put in cocks the day before. We would leave it in the cock for two or three days. If it rained, it wouldn't penetrate much if the hay was sufficiently green and the cocks were small enough. When a dry day came we merely turned the cocks over and hauled the hay to the barn. I would judge that these cocks held about 50 lbs. of hay each. It would seem to me that Professor Graber's recommendation of 80 to 100 lbs. is rather large, particularly if caps are not used.

I found that directly under the hay fork the hay would get moldy so I took two poles about 8 inches in diameter and laid them on the floor about 4 feet apart, and under the hay track. On these I nailed 2x4's crosswise and placed this under the mow. This overcame my trouble with moldy hay.

If I were to give hard and fast rules as to how to make alfalfa hay after my 25 years of experience, it would be as follows: For cows, cut the alfalfa as soon as the new shoots are well started on the crown, while for horses wait a week or two longer. Never mind the bloom stage for sometimes it won't bloom. Cut the hay during or just immediately after a rain. Don't wait for the weather to settle before you mow. If you do, the chances are it will rain about the time the hay is dry. If the weather doesn't clear up and the hay is damaged, the rain is sure to make another crop, so we wouldn't feel so badly.

When the alfalfa has wilted nicely, put it into cocks. If it is damp with dew or rain, make the cocks even smaller. When cured, haul in the hay and be sure to add about 1½ gallons of salt to the load.

Kansas. E. E. HAZEN.

Coming Events

Sept. 14-20—Eastern States Exposition at Springfield, Mass.
Sept. 27-Oct. 4—National Dairy Show, Milwaukee, Wis.
Sept. 22-28—Dairy Cattle Congress, Waterloo, Iowa.
Oct. 21-23—Wisconsin Buttermakers' Asso. meets at Chippewa Falls, Wis.
Nov. 1-8—Pacific International Live Stock Exposition, Portland, Ore.

Purdue Dairy Club Cafe

Students competing on the Purdue Cattle Judging Team will conduct a first class dairy luncheon stand at the Indiana State Fair. The place will be known as the Purdue Dairy Club Cafe. We look upon this style of restaurant at our fairs as being advantageous to the dairy industry. It is a most opportune time to place before the consuming public the toothsomeness and wholesomeness of dairy products.

Washington, D. C., Weekly News

[Special to Hoard's Dairyman.]

WASHINGTON, D. C., AUG. 19—The executive committee of the American Dairy Federation, at a meeting held at the office of the secretary on Aug. 19, decided to call a special meeting of the federation to be held at Milwaukee at 4 p. m., Wednesday, Oct. 1. This date is the date of the federation's get-together banquet, which is to feature the participation of this organization in the activities of Dairy Exposition week. The purpose of the special meeting will be to take action on several pending matters of business, including standards for dairy products, representation before the Tariff Commission in the butter tariff investigation, and appointment of special committees to report at the annual meeting to be held in December.

⚜

The officers, executive committee, and Standards Committee of the National Association of Ice Cream Manufacturers met with the Executive Committee of the American Dairy Federation at their session here last Tuesday. There was a full discussion of the proposed standard for ice cream which the ice cream manufacturers object to in several particulars. They asked the support of the federation in their objections. M. D. Munn was chosen as the representative of the federation to present the matter to the Joint Committee on Standards and Definitions. The principal question at issue is the amount of butterfat which ice cream must contain. The tentative standard which has been announced for discussion proposes twelve per cent and a total of 20 per cent total milk solids. The ice cream committee wants the fat content lowered and the other milk solids increased, making the fat content eight per cent minimum and the other solids 12 per cent. The Dairy Federation will conduct a referendum of all its members on this proposal.

⚜

H. J. Greenhalge of Chicago, head of the well known firm of accountants that is employed by many of the members of the butter industry, has been selected as consulting accountant for the butter tariff inquiry, by the U. S. Tariff Commission. He will assist R. D. Comer, chief investigator for the Commission in making the calculations designed to show the cost of producing butter in Denmark.

⚜

Expressing special approval and commendation of the progress already made in the establishment of the Bureau of Dairying, the American Dairy Federation Committee which met here the past week discussed at some length the further activities which might be allocated to this bureau, both now being carried on by the Department of Agriculture and some lines of new work which might be taken up if Congress should authorize it. As a result, a special committee was named to survey this field, confer with the Secretary of Agriculture, and report back to the federation as soon as possible. Dr. George L. McKay is chairman of this committee and other members include Professor Reed of Michigan and A. J. Glover, editor of Hoard's Dairyman. Another committee named at the meeting of the federation was authorized to urge the appointment of foreign agricultural attaches under the direction of the Secretary of Agriculture to secure needed foreign information for the benefit of agriculture such as is now enjoyed by other American industries. E. M. Bailey, chairman of the executive committee, was named as chairman of this committee.

⚜

Progress of co-operative marketing in the United States has attracted the attention of the British Ministry, now struggling with a problem of serious economic trouble among British farmers. As a result Professor Forster of Oxford has been sent to the United States to make a thorough survey of the methods in use here, and successes accomplished in order to find methods which can be applied to the relief of English agriculture, if possible. "Outside of the Rochdale co-operatives," said Professor Forster to your correspondent, "we can not say that co-operation has made any outstanding progress in England. Our marketing problem is very difficult as with the single exception of fluid milk, the markets are dominated by foreign products. We frankly do not know whether co-operative selling will solve our troubles or not. English farmers do not believe that the methods in use in Denmark—without criticising them at all—will meet our needs, because of far different conditions with us. Now we want to know the facts about the American co-operatives so we may judge if your methods will prove adaptable to our needs."

Oregon College of Agriculture has written officials of the National Dairy Show for information on tours through the Wisconsin dairy region. A delegation on a special train will come to the show, college officials assert.

Gold Medals Won by Ohio Jersey Herd

Charles A. Geyer of Ohio is the owner of two Jerseys which finished their tests within two days of each other and each of which qualified for gold medals. One of these, Justa's Jewel, commenced test as a mature Jersey and produced 12,986 pounds milk, 671.12 pounds fat in ten months. She carried a living calf more than seven of the ten months she was on test, which with her production won her a gold medal.

The other gold medal winner in this herd is La Oonan Queen. She commenced test at ten years, nine months of age and in ten months produced 13,288 pounds milk, 643.01 pounds fat. She carried calf almost seven of the ten months she was on test.—American Jersey Cattle Club.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Not Paying Fiddler

HOARD'S DAIRYMAN:—As I have een reading the arguments of New ork Teat Puller he sounds so much ke a braying ass. Will try to answer is annoying and insulting questions y saying to him on the first question iat he and others that ought to be aying part of the expenses, are not oing their part of paying the fiddler. o-operatively, his and their part are ie last of the selling and handling of ie milk products.

The answer to the second question like that unto the first and that is ey don't believe in co-operation with llow dairymen.

The third is still similar and mpler. Some of them are back-iders, as he would be. Maybe he uld be intelligent if he had the nse to see the wrong that he is ing others but he doesn't see the ong he is doing the dairy industry mself.

This answers all of his questions rfectly by the Missourian that sym-thizes with any honest, sincere, and asonable co-operator in the dairy lustry.

Please go behind the barn and k yourself for being a knocker of ur fellow dairymen's sincerity. ritten by a co-operative in the M. A. of Missouri.

Missouri. FERDINAND OTLAFF.

McKnight vs. Peterson

HOARD'S DAIRYMAN:—Mr. A. N. erson, in your issue of July 25th, rges me with evading an answer his statement that "not alone rent-values, but all values are created economic demand".

Economic demand, to my mind, ans the demand made by human ngs on the raw materials of na-e. Mere demand will not furnish the shed product, i. e., these raw ma-ials changed into articles of use, nfort, and luxury. Labor must be lied to these raw materials before demand can be satisfied, making finished product not alone the ee gift of God or Nature, but of r also. Many forms of finished duct can have great value to their essor without having any econom-alue. I may create great values myself by building a mansion on e far out of the way spot. These es may continue (minus deteriora-from the natural process of de-for a long time. If no one else es to my isolated spot no land al will arise, but should there be sh of population coming my way, omic demand would at once make value or rent to arise.

fter all his brave words and ges he has to (reluctantly, it s,) admit there is "an apparent rned increment of land values in centers of population". Might I him, if population increases and drift toward the centers of pop-on goes on, will there not be a ly increasing amount of un-ed increment produced? His il-ation of the "Israelitish horde ing a desert in which they creat-o land values" is open to criti-

While the general impression that these people were nomadic as permanency of residence is nsible for the arising of land yet as they were forty years going a comparatively short distance and were burdened with numerous cattle that required watering, it seems not unreasonable to me, that the immediate neighborhood of certain life-preserving oases acquired a great value. If, when they "afterward were fed on bread from Heaven and water from the smitten rock", their land was made subject to private ownership, the manna and water would be the private property of the owners of the land.

He states that the "2,000,000 Israelites on Manhattan Island and its environs add no more to the real estate values of New York City than their 600,000 to 2,000,000 ancestors added to desert values". I would advise him to get the opinion of some New York City East Side real estate agent on this question, or, if he will guarantee to get these 2,000,000 Israelites to emigrate down here to the eastern shore, I will guarantee to make him rich in 5 years, provided that the Commonwealth Land Party remains a minority party. The chain retail stores, who it is said base the rental of any desired location on the numbers (by actual count) of people who pass in a given time, probably have counted some of these 2,000,000 Israelites, but that would not bother them when making their offer of rent.

Mr. Peterson says "it is not the presence of population that makes land valuable, but rather the agricultural or mineral resources adjacent, fisheries, or the strategic position of a locality, that makes a large population possible." It seems to me, these things which he enumerates existed long before a white man set foot on Manhattan Island, and the only reason they have great value now, is because they are surrounded by 8,000,000 or more people—allowing for the collection from them, by owners of land, of $500,000 yearly. His illustration of the $24 originally paid by white men for the island, increasing at compound interest for 300 years as about equalling the land rentals of New York City may be correct, but is there not some difference in the results?

Having only spent 61 of my 64 years of life in Philadelphia, that would not take me back to the time when the land of Philadelphia was a howling wilderness, but I can recite hosts of instances where economic demand has greatly increased the rental value of land in some sections through increase in population, or, the falling off in rental value in certain sections owing to the drift of population. In my father's young manhood, the business section was at 2nd and 3rd Streets and there the highest rents were paid. He lived long enough to see certain of these stores, which still exist, reach a sale value not as great as their yearly rental value of his earlier days. In my early manhood, the section known as West Philadelphia was sparsely populated and the rent of land was low, but where cabbage and potato patches abounded then, residences and apartment houses solidly occupy the ground and the rent of land is high, almost, in some instances, as high as in the centers. Mr. Peterson asks the single taxers to "do a little straight thinking and we could see the specious fallacy of calling the profits coming to land owners as unearned."

Maryland. OLIVER MCKNIGHT.

Work that motors can do

On two out of five farms, a nation-wide Government survey shows, water for household use is carried by women. In the course of a year they carry tons of water.

Running water in the house—in the bathroom as well as the kitchen—is one of the conveniences that farm electrification has already brought to thousands of homes.

Electricity, that transformed the cities, has opened a new era of better farming.

The use of electricity in this country has quadrupled in ten years. To this wonderful development the General Electric Company has contributed more than thirty years of scientific achievement.

The new G-E Farm Book, giving interesting facts on the subject of farm electrification, will be sent on request. Write Section E, General Electric Company, Schenectady, N. Y.; Chicago, Ill., or San Francisco, Cal.

GENERAL ELECTRIC

ATTEND THE FRIENDLY SHOW

DAIRY CATTLE CONGRESS

A GREATER SERVICE to the dairy industry is the goal of the 1924 Show. Ever since the gates closed last year the management with the assistance of the educational forces of the state and nation has been busy planning an event that will eclipse any of its predecessors.

WHY DENY YOURSELF the great object lessons taught by the hundreds of exhibits and demonstrations that will profitably occupy your time every moment of the big week? Whether you live a hundred or a thousand miles from Waterloo you'll find it the best trip you ever made.

ENTRIES CLOSE SEPT. 8th

Sept. 22-28 — Waterloo, Iowa

REDUCED RAILROAD RATES—a round trip rate of a fare and a half from Iowa, Illinois, Wisconsin, Minnesota, North and South Dakota, Nebraska, Kansas and Missouri. Ask for certificate for return if coming from outside Iowa.

Keep Tab on Your Cows!

Send 5c in stamps for samples and prices of our weekly and monthly Milk Record Sheets. Hoard's Dairyman, Fort Atkinson, Wis.

Vacation a Good Time for Repairing Defects

Did you ever feel ashamed of the standing of your child in school as compared with that of the other children? There are not enough places at the top of the class so that all children can be there but parents like to have theirs within speaking distance of the head.

Poor marks often come as the result of a child's playfulness but more often they can be traced to a more tangible cause. If a child seems serious about his work but fails to get on, it may be that his eyes are the cause of the whole thing. Imagine how nerve-racking it must be to sit straining at the blackboard and being just able to get the problem deciphered by the time it is erased and a new one started. Such a child spends his whole energy simply seeing the problem; he has none left for understanding it.

A child has no past experience to go by. A little boy who sees poorly thinks that others see just as poorly but get along because they are smarter. In this way a sense of inferiority is added to his other worries.

The summer vacation gives a good time for investigating the physical equipment of children. Long days in the open air, sunlight, and fresh green foods are all available to help in any correction that may be needed. There is no doubt that we are becoming a race dependent upon glasses but I firmly believe that about half of this is unnecessary.

The eye is a very delicate thing but it has enormous powers, many of which can be developed with a little care. Headaches, backwardness in school, and peculiar attitudes in reading may all point to eye trouble. They deserve an examination, at least. Children who are properly fitted at the right time more often than not outgrow their eye troubles and are able to discard their glasses.

Proper care of the eyes and prevention of trouble should include:

1. Good light. This should be steady and should come from the left and a little above for right-handed persons. Avoid a glare and do not read while in motion.

2. Eye examination by a good oculist (not an optician) if there is any indication of trouble.

3. Avoidance of fine, close work.

4. Frequent rest for the eyes. Looking off into the distance is a good rest. Do this at intervals when engaged with something very near.

A practice recommended by one competent eye surgeon consists of a couple of exercises to be done the first thing on waking. One of these is to wink the lids as rapidly as possible 30 times, rest, and repeat. The other is to revolve the eyeball as far in every direction as is possible without strain, first to one side and then to the other, keeping the eyes closed.

Sty is one of the common eye complaints and while not dangerous is often very painful. It is an infection of one of the glands along the lids and while its cause is not definitely known, it is thought to come either from eye strain or from rubbing with dirty hands.

Most stys do not come to a head but when they do they should be opened with a sterilized needle and the pus squeezed out. Cotton on a toothpick is good for this. The open spot should then be painted with a five per cent solution of argyrole. This is entirely harmless to the eyeball so you need have no fear if some gets in the eye. We used this under a doctor's direction a year or two ago and discovered then its general value.

A case of eye trouble in our family last year was diagnosed as pink eye and treated as that for a week. As it did not improve, a more complete examination was made and the cause was found in infected tonsils. When these were taken out the eye trouble disappeared completely as it was a case of poison being discharged from the tonsils, taken up by the blood and carried to the eyes.

A good thing to have ready is a saturated solution of boric acid. The water for this should be boiled, cooled, and put into a sterilized bottle. Then enough boric acid powder is added so that when all has dissolved that will there is a precipitate of it in the bottom. A person who habitually has tired or weak eyes will do well to get an aluminum eye cup and wash his eyes with this night and morning. Men working all day in dust or glare will find this restful. Mild salt water is good, too.

The eye is very much affected by the general tone of the body and before becoming discouraged about the condition of your sight it would be well to look to the general building up of the rest of you. Summer is the time to do it, particularly in the rigorous northern climates.—LUCY THOMPSON.

Turnip Tops

Someone writes in, "What does Lucy Thompson mean when she says that turnip tops should have something cooked with them?"

The inquiry came as the result of a few remarks on the subject of greens. I have known people who recommended the use of pretty near every leafy crop for greens, even alfalfa. Of course, we all use spinach, beet tops, and other things of the sort and I once tried using turnip leaves, pure and unadulterated, but the result was awful. You know how rough a turnip leaf is. Well, cooking doesn't seem to take away that roughness and we felt as if we had swallowed a bristle brush the day we ate the turnip greens.

That is why they should have something cooked with them. If you have plenty of the something else, don't use the turnip leaves at all; they only act as a filler and have no more vitamin value than anything else.—LUCY THOMPSON.

Shorts

The very best sink strainer that I have ever seen was made by punching holes in the bottom of an ordinary lard pail, using a stout nail and hammer to make the holes with. About two dozen holes were made. This utensil takes little room, keeps the meal-to-meal garbage out of the way, has no paint to wear off or enamel to chip. It can easily be kept bright and clean.

Keep coffee in an air tight can. It loses its strength and aroma when it is exposed to the air.

Castors under the legs make it possible to move the work table to the most convenient spot for each job. If you are preparing a meal you can shove the table close to the stove so that you can work from one to the other without unnecessary steps. You may push it close to the dining room door and receive the dishes on it and carry them to the sink. You can put the dried dishes onto this table and take them to the cupboard. Such tables with and without porcelain tops are on the market, but castors put into your old work table will serve the same purpose.

Some chopped mushrooms and a half-cup of grated cheese added to the cream sauce for fish is a great improvement.

Iron pots rust easily, especially when they are new. The seasoning of an iron pot cannot be done in a hurry. The rust must be rubbed off again and again, each time greasing the pot with lard or some other fat that is free from salt or water. Even then it will take a long time to get the pot to the place where the little patches of rust will no longer appear.

The best way to keep cider sweet is to boil it for about twenty minutes in order to sterilize it, then bottle in sterile bottles and cork with sterile corks. When the bottles have been corked it is best to seal them by dipping the heads in melted canning wax. They should be stored in a cool cellar and the bottles should be protected from the light. Fruit jars can be used for canning but the same care must be taken so that the jars and covers are thoroughly sterile. Canned in this way cider will keep sweet for a long time.

The beauty of fine linens depends chiefly on the care with which they are washed and ironed. The small pieces of linen that are embroidered heavily will not look their best unless they are ironed on a thick pad with a moderately hot iron. If they are ironed on the wrong side, pressing from the center outward, always in the direction of the threads, the result will be most satisfactory.

Drawnwork is sometimes very difficult to manage. The open work shrinks more than the plain linen around it. To get good results lay the edge straight along the edge of the board, and stretch the drawn work in both directions. It should be ironed on the wrong side and stretched carefully all the while it is being ironed. When the article is completely dry it will be in perfect shape.

If linen has lace edges or lace corners, iron the linen first, then iron the lace on the wrong side, without stretching the edge of the linen. All pieces of linen should be rolled and not folded.—SOPHIA K. ORMOND.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Miscellaneous Fashions

No. 2070—Becoming Dress for the Plu Woman. Cut in sizes 36, 38, 40, 42, 44, and 48 inches bust measure. Size 36 requi 3⅞ yards 40-inch material with 1⅛ ya 36-inch contrasting.

No. 1639—Neat Porch or Morning Dr Cut in sizes 34, 36, 38, 40, 42, and 44 inc bust measure. Size 36 requires 4⅜ ya 36-inch material.

No. 2097—Youthful Style. Cut in sizes years, 36, 38, 40, and 42 inches bust meas Size 36 requires 2⅞ yards 40-inch mate

You'll save dollars by doing Address Fashion Department, Hoard's D man, Fort Atkinson.

"A meal well chatted is half gested."

Brief History of the New Salem Circuit

In 1883 a Northern Pacific land commissioner unloaded a colony of German-Americans at a railway siding, which was later named New Salem.

The new settlers failed in grain growing and in the later 80's they commenced to milk the native cows and to make butter. W. H. Mann, a storekeeper, bought their butter but color and flavor of the butter varied so that Mr. Mann deemed it advisable to purchase whole cream which he churned in the basement of his house. In 1896 the New Salem creamery was built jointly by people of New Salem and the farmers of the community. In 1898 a second creamery was built at Youngtown, 10 mlies inland to the north. In 1909 the U. S. Department of Agriculture, through W. M. Hayes, Assistant Secretary of Agriculture, offered jointly with any experiment station in any state to start a community breeding experiment. Professor J. H. Shepperd, believing that New Salem would co-operate and learning that they had purchased a carload of pure-bred dairy cattle jointly in 1906, proposed that a breeding circuit be established there. On January 1, 1910, the circuit was instituted and record keeping and co-operative breeding began. Twelve members signed up, 10 of these original 12 herds are still in the circuit; 10 of the original owners have passed but their herds are still in the circuit in the hands of some members of their respective families and on the original farms. All circuit cattle are tested for tuberculosis annually and are all on the accredited list.

Average gross income per farm from butter in 1921, $1,107.91.

Average gross income per farm from butter in 1922, $1,181.88.

Average gross income per farm from butter in 1923 was $1,621.95.

Five per cent of the sales from pure-breds goes into the circuit treasury for an advertising fund.

The high producing herds for 1921, 1922, and 1923 are as follows:

	Cows	Ave. lbs. fat	Ave. value	Ave. feed cost	Income above cost of feed	Year
Henry Kroeger.....	5	364.5	$127.09	$43.43	$83.66	1921
Dick Wilkins.....	9	327.5	113.40	41.20	72.12	1922
Charles Holle.....	11	410.5	131.34	45.52	85.82	1923

A grade cow in the Wilkins herd produced 419.3 pounds fat during the calendar year 1922. During six months of that time she grazed in the co-operative pasture and received no grain feed.

Charles Holle's cow, Dakota Marie Pearl 347179, raised the circuit calendar record with 609.3 pounds fat from 11,195 pounds milk in 1923.

The state average production of butterfat for cows of North Dakota is 126 pounds per year, according to the United States census report.

Condition of a Typical Circuit Herd

Year	No. cows	Fat Lbs.	Income above feed per cow from fat sold
1910	17	131.9	$16.90
1911	12	140.7	13.20
1912	17	189.5	35 45
1913	16	211.4	33.09
1914	10	282.4	50.98
1915	13	291.8	54.50
1916	14	427.6	90.24
1917	14	340.5	92.00
1918	11	262.9	96.65
1919	16	277.6	94.20
1920	18	272.9	93.58
1921	17	286.2	50.32
1922	18	298.1	58.00
1923	12	303.4	82.74

An average increase per cow for last four years over first four years of 172 per cent.

During the first 4 years 62 total cows were milked and during the last four years 65 head.

Sixty-nine per cent increase in yearly butterfat per cow.

One hundred seventy-two per cent increase in yearly income above feed cost in ten years.

Other Features of Cooperation

The New Salem creamery was built in 1896 and has never closed its doors for a single week since the opening date. The farmers hauled the boulders and sand and performed such of the work as a layman could do. The townspeople furnished the money necessary for erecting the building.

Eight milking machines were bought on a wholesale contract by circuit members.

Eight silos were bought co-operatively and the foundations built as one contract.

Nine-man threshing rings are quite standard organizations in this region.

Five-men silage rings put up the silage in this neigborhood.

Four circuit members use a section of land for pasture without cross fences, each turning his herd in through a gate on his side of the pasture.

There is a mutual fire insurance company here now more than 20 years old and operating extensively in three counties.

A picnic meeting in midsummer and an annual business meeting are the outstanding circuit sessions of the year.—J. H. SHEPPERD, North Dakota Agricultural College.

"KNOWING my tires will never give me trouble—that I can drive over any kind of road without fearing for them—means much to me. For that reason we always buy Fisk Red-Tops."

The Fisk Red-Top Tire with its extra ply and extra heavy tread is built for use on country roads. Once used it is always specified when a new tire is needed.

Grindin' Feed

Some days upon the farm are blessed
With brimming happiness,
While others dawn and slip away
In seeming emptiness;
Some days cling deep in memory,
Some days are sad indeed,
But just about the grandest days
Are those of grindin' feed.

It's always on the windy days
You turn the old mill loose,
Then shut the door on zephyrs wild
And sing to beat the deuce.
The wind howls through the shingles old,
As if an ancient reed
Had been attuned to faulty notes—
The notes of grindin' feed.

Or else it's on a rainy day,
When all outdoors is drab
And raindrops rattle off the roof
Or 'gainst the window stab.
The grinder fills the room with dust,
With gnashings, in its greed,
But still it's sort of peaceful there
When just a-grindin' feed.

The grinder keeps you shoveling,
You hustle at the task;
There's not much time for "mooning" or
In idleness to bask.
So long as eery howls come from
The unseen, passing steed,
You feel content to be shut in,
Engrossed in grindin' feed.

For true it is, that most of us,
At times, crave solitude—
To be alone, shut off by rain
In mental lassitude.
We like to play there's only "me"
From worldly worry freed,
And that's just why I look ahead
To days of grindin' feed.

—R. D. GALT.

Aunt Ada's Axioms: Those who spend little effort in making other persons happy will soon have little to spend.

Throw Away the Dish Pan

New invention makes possible the washing and wiping of dishes and cream separator parts in a minute.

Heat the water in the machine, put in the dishes and in a minute's time they can be taken out thoroughly clean and dry.

Send Ten Dollars today, without delay and a dishwasher will be sent to your door prepaid. Perfect delivery guaranteed.

League's Pool Price for July

The New York Dairymen's League July gross pool price for 3 per cent milk at the base zone is $1.50, which is 8 cents higher than the June price. Deductions for expenses amount to 8 cents and for certificates of indebtedness 10 cents. The July net pool price, therefore, is $1.42 and the cash distribution is $1.32.

Dairy farmers throughout League territory are rejoicing over the recent announcement by the Dairymen's League Co-operative Association, Inc., of an increase in the base price of 3 per cent, grade B milk to $2.60 per 100 pounds. At the same time the price of Class 2 milk, sold in the form of sweet cream, was advanced to $1.90. Since August 1 the total increase in the price of fluid milk has been 74 cents.

In making the announcement, officials of the League declared that a sudden unseasonal shortage of fluid milk in the primary markets was the immediate cause of the increase. Several factors seem to have entered

into the situation—dry weather in parts of League territory, less outside milk coming in because of low prices, decrease in milk movement to the markets because of hot weather. All these suddenly brought about the condition where a substantial increase was justified and promptly put into effect by the pooling organization.—Dairymen's League.

Cheese Markets

(Report by U. S. Dept. of Agriculture)

Cheese markets were easier and trading lighter during week ending Aug. 16. Heavy storage surplus and continued heavy production are factors of importance. Price changes during the week were slight.

The average wholesale prices on American cheese, style Twins, for the week ending Aug. 16, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending Aug. 16 1924	Aug. 9 1924	Aug. 16 1923
	Cts.	Cts.	Cts.
New York	21.1	21.1	25.0
Chicago	19.2	19.2	23.0
Boston	21.2	21.2	25.3
San Francisco	19.0	19.0	25.5
Wisconsin Boards	18.7	18.8	23.2

The receipts of cheese at these markets were 5,471,827 lbs. for the week as compared with 4,355,438 lbs. last week and 5,111,911 lbs. a year ago.

Butter Markets

(Report by U. S. Dept. of Agriculture)

Butter markets were firmer during the week ending August 16, although undertone of the market was more or less nervous. Reports indicate continued heavy production and storage holdings being added to despite the 31,000,000 lbs. surplus on August 1 as shown by the total U. S. report. Firm foreign markets have temporarily resulted in some butter being shipped to England.

The average wholesale prices on 92-score butter for the week ending Aug. 9, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending Aug. 16 1924	Aug. 9 1924	Aug. 16 1923
	Cts.	Cts.	Cts.
New York	38.3	37.8	44.0
Chicago	36.7	35.9	42.7
Philadelphia	39.7	38.5	45.0
Boston	38.5	37.6	44.1
San Francisco	40.6	39.6	44.9

The receipts of butter at these markets were 15,489,036 lbs. for the week as compared with 16,690,574 lbs. for last week and 12,662,589 lbs. a year ago.

Twin City July Prices

The Twin City Milk Producers' Association paid its members $1.85 a hundred for 3.5% milk delivered Twin Cities during July. It paid 42c a pound for first grade butterfat in cream.

There was a decided dropping off in milk received during the last week in July, but the total for the month was 3½ million pounds more than for July last year. Of the 22 million pounds received, 55% was sold to distributors at $2.10 a hundred. It cost 25 cents a hundred to operate the plants and pay other expenses.

MILWAUKEE, Aug. 26—Butter—Creamery, fresh, extras, tubs, 36½c; standards, centralized, 35½c; extra firsts, 34@35c; firsts, 32@33c; seconds, 30@31c; ladles, 26@28c; packing stock, No. 1, 24@25c; off goods, 15@20c.

Cheese—American, full cream, Twins, 18½@19c; Daisies, single, 19@19½c; do, double, 19@19½c; Young Americas, 19@19½c; Longhorns, 19@19½c; squares, 19½@20c; 5-lb. loaves, American, 32c; do, pimento, 34c; Brick, fancy, 17½@18c; Limburger, 18@19c; Swiss, block, 25@30c; do, loaf, 32@33c; imported Swiss, loaf, 46@48c.

NEW YORK, Aug. 25—Butter—Easy; receipts, 7,674 tubs; creamery, higher than extras, 39@39½c; creamery extras, 92-score, 38½c; creamery firsts, 88 to 91-score, 36@38c; packing stock, current make, No. 2, 27@27½c.

Cheese—Unsettled; receipts, 35,941 lbs.; state whole milk, flats, fresh, fancy to fancy specials, 20@21c; do average run, 19c.

CHICAGO, Aug. 25—The butter market today traded very quiet and appeared easy with an unsettled undertone. Receipts were more liberal, but supplies available for trading on street were not burdensome. Receivers were free sellers at prices listed about, but buyers were indifferent and very critical as to quality. The centralized car market was easy with trading very quiet. Supplies of 88- to 89-score was liberal and freely offered.

Fresh butter—92-score, 36½c; 91-score, 36c; 90-score, 35½c; 89-score, 34½c; 88-score, 34c; 87-score, 33½c; 86-score, 32½c. Centralized carlots—90-score, 36¼c; 89-score, 35c; 88-score, 34c.

FOND DU LAC, Wis., Aug. 23—Average cheese prices (majority of sales) f. o. b. shipping point: Single Daisies, 19c; Young Americas, 19c; Longhorns, 19c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Aug. 23: Single Daisies, 18c. On Farmers' Call Board Aug. 21: Single Daisies, 18c; Young Americas, 18c; Longhorns, 18c; square prints, 19c.

More Milk *now*— more milk for years to come

Two things are necessary to make a dairy feed profitable—It must show you immediate results by making your cows give the most milk possible, and it must keep them in such condition that they will increase that production year after year.

Right from the start LARRO lays a sure foundation for consistent heavy milk production by first building up the health and condition of your cows. Continuous feeding of LARRO maintains health and condition, thus guaranteeing peak milk production, not only now, but month after month, year in and year out.

Actual figures prove this true in thousands of cases—among grade cows and thoroughbreds alike, regardless of breed, regardless of geography.

Cow No. 241 is an ordinary barn Holstein bought by the Larro Research Farm in 1922 for $125. She had been milking 150 days when she arrived at the farm. Her production during the first 30 days thereafter was 724.5 pounds of milk. In her next lactation, during the corresponding 30 day period, she produced 1,173.3 pounds of milk—more than 50% increase. Her total milk production in the first full lactation period at the Larro Research Farm was 13,646.4 pounds—more than three times the average for all cows in the United States. Larro—maintaining health and condition—plus proper care, did it.

Prince's Rose of Meadowbrook is a Jersey who broke the Pennsylvania state record for 2-year-olds in 1922 with 9,810 pounds of milk and 462.79 pounds fat. In 1923 she again became state champion with a record of 14,292 pounds and 639.05 pounds fat. As a calf she was started on a Larro grain ration and kept continuously on Larro throughout the milking periods mentioned.

Down in Florida, Ferndell, of the famous Lemon City White Belted Herd, produced 13,477.9 pounds of milk and 585.64 pounds of butter fat in her twelfth year—five or six years past the age of peak production for most cows. The herd she leads has been fed Larro for thirteen years and averages 9,998 pounds per year.

A feed that accomplishes such long distance results must be a feed that first builds health and condition—then positively maintains these two important requirements for profitable milk production.

Your cows should be on a grain ration now. There is no feed that will more surely guarantee future production and future profits than Larro.

The SAFE Ration for Dairy Cows

Holstein Special for Grades

The Holstein-Friesian Association of America has added $300 in special prizes for the grade cow classes at the National Dairy Show. It has taken this step to show its interest in the promotion of cow testing association work and to make possible a better exhibit. This prize money will be apportioned as follows:

For the cow testing association exhibiting the largest number of grade Holstein cows—$25 for first, $15 for second, and $10 for third.

Fifteen placings in addition to the regular prizes are provided for in the class for cows producing 350 lbs. of fat or over, and a like number for the 250-pound class. This will provide a total of 25 prizes in each of these two classes, ranging from $30 for first place to $5 for twenty-fifth place.

The WINDMILL with a RECORD

The Auto-oiled Aermotor has behind it 9 years of wonderful success. It is not an experiment.

The Auto-oiled Aermotor is the Genuine Self-Oiling Windmill, with every moving part fully and constantly oiled.

Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet.

The Auto-oiled Aermotor is so thoroughly oiled that it runs in the slightest breeze. It gives more service for the money invested than any other piece of machinery on the farm.

You do not have to experiment to get a windmill that will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine.

Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production.

The Aermotor is made by a responsible company which has specialized in steel windmills for 36 years.

AERMOTOR CO. Chicago Kansas City Dallas Minneapolis Des Moines Oakland

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

A Wonder Boy Dairyman

They say he is the boy champion dairyman of the United States. Whether or not this is true, he has had remarkable success feeding and milking cows in the home herd as shown by the cow testing association records.

Thomas Harvey, Wisconsin, is 13 years old, and among other accomplishments last year, he owned, fed and took care of Star, a grade Holstein cow that stood next to the top in the Hazel Green Cow Testing Association, which organization had the second highest herd average among the 165 such associations in Wisconsin in 1923.

Harvey is a very faithful reader of the Junior Page of Hoard's Dairyman, and this spring, while recovering in the hospital from an accident which cost him the sight of one eye, he had his mother read the Junior Page to him. Harvey has been a good school boy and his marks seldom fall below ninety. Although he has been unable to attend school since his accident, we hope that next fall will find him back with his schoolmates. In the meantime, he is caring for the cows and continues to be the dairy boy wonder.

Star freshened again this spring, but udder trouble kept her milk flow down. Harvey is considered a good feeder, and here is his account, written especially for you Hoard's Dairyman Juniors, of the way in which he fed and cared for Star, also a little something about some other cows in the home herd:

I fed my cow, Star, equal parts of bran, ground corn, cob meal, and ground oats. The reason I did not feed oil meal was because she would not eat it. I also fed ¼ pound molasses feed three times a day. I have not told you how much ration I fed her at a time. She received four pounds morning and night, and about five pounds of whole oats at noon and all the second cutting clover she would eat. I clean her once a day, and real good on Saturday. The most milk she produced any one day was 72 pounds. The most butterfat she made was 89.9 pounds a month. She milked continuously for 16 months. She produced, during the association year on which she was milking nine months, 12,975 pounds of milk and 566 pounds of butterfat. She was milked three times a day for three months. When I was at school papa milked her for me. I recently sold Star to papa. I am now starting in with a pure-bred calf. But I am going to milk and care for Star just the same.

We milked four cows three times a day last month (June)—Star, who made a record of 69.4 pounds of butterfat with a 4 per cent test, Daisy, Rosetta, and Cosetta. The last two are four-year-old twins. Cosetta gave 2,079 pounds of milk with a test of 4 per cent, making 83.2 pounds of butterfat. Rosetta gave 2,049 pounds of milk with a test of 3.3 per cent, making 67.6 pounds of butterfat. I fed and took care of these cows most of the time, feeding equal parts of ground oats, bran, and sucrene, three pounds per cow three times a day. We had high cow and high herd in the association which pleased me very much. Twinkle is a very fine individual. I believe I told you I had gone into pure-breds. I bought a pure-bred Holstein heifer calf from Leo Kuhl & Son. Her name is Korndyke Pabst Abigail De Kol. She is now nine months old and weighs about 624 pounds. I bought her for our calf club work, paying $60 for her when she was 6 days old.

THOMAS HARVEY, A HOARD'S DAIRYMAN JUNIOR, IS A GOOD COW FEEDER. HERE HE IS WITH STAR, WHOSE CALF'S NAME IS TWINKLE

About Two Junior Showmen

J. Harold Fogg and Robert Krog are two New Jersey club boys who say they have fully decided to be good dairymen and breeders of Holsteins. They have made a great beginning.

Harold, who is 12 years old, paid $150 for his heifer, Princess Abbekerk Prilly Segis, when she was six months of age. She has already won $182 in prize money for him and he expects to continue winning with her and her offspring in the years to come. At the Trenton Interstate Fair, Judge Moscrip awarded "Princess" first in a class of twenty senior yearlings, which included some of the best in the country. She was also Champion Club Holstein at that fair. She later won prizes at the National Dairy Show.

It is of interest to know that "Princess" is a daughter of Winterthur Prilly Segis Marmagel, who was grand champion Holstein bull at the Trenton Inter-State Fair for two years prior to 1923. Harold expects to put an Advanced Registry record on her after she freshens in March.

Robert Krog of Plainfield, New Jersey, won honors in the club classes at the National with his yearling, Colantha Aaggie Carlotta, when he

J. HAROLD FOGG AND "PRINCESS"

was awarded the Showmen's Cup donated by the Junior Extension Department of the Holstein-Friesian Association of America

At the present time calf club work is one of the leading dairy projects in New Jersey. There are many cases on record where high class club animals, introduced in backward dairy communities, have been the means of inaugurating tuberculin testing, the use of well bred bulls, and better feeding methods because the county club agents give close supervision to the proper raising and management of the 400 or more dairy heifers, along with the poultry and pig clubs. Every state club leader recognizes the necessity of close supervision in dairy calf project work which extends over a period of three years, and where the investment is comparatively high.

New Jersey. E. J. PERRY.

Robert Krog is quite a fellow. Club work has meant a great deal to him. In fact it has changed his choice for

ROBERT KROG WINS SHOWMAN'S CUP

a life profession. He has written you Hoard's Dairyman Juniors a letter and here it is:

I was born and raised on a dairy farm but like a lot of other boys, I thought dairy work was tedious and a poor business for anyone who wanted to make a name for himself in this world. I made up my mind that I would go to the city and get a job as soon as I was able to do so, there the working hours wouldn't be daylight or earlier until dark or later.

My dad had a herd of 20 grade cows representing all of the known breeds. He retailed his milk in Plainfield, New Jersey, and had built up a reputation for clean milk from tuberculin tested cows. The bacteria count of this milk seldom ran over 6,000 and frequently was as low as 600. Even at that, the reputation my dad made didn't knock the city idea out of my head.

One day in October the county club agent, Carl B. Bender, came out to our place and talked up the calf club idea to dad and myself. He said there were good pure-bred heifers of excellent breeding to be gotten in various parts of the state at a reasonable price. Dad thought it would be a good idea to get one for me and see what she would do.

We attended a community meeting about a week later when the idea was sold to fifteen boys and girls and the club was organized with Robert Williams as president.

In due time the calves were purchased by a committee.

The calves arrived and lots were drawn and Colantha Aaggie Carlotta, 720885, was given a ride to her new home in our milk truck. She took to her new quarters as a duck to water and immediately began to take care of the little surplus milk we had and even cheated some of our customers out of theirs.

She always received all the feed she would clean up and began to grow at once. Her disposition seemed to improve at once and she soon became the family pet and certainly responded to all of our advances.

As a senior calf she went to the Eastern States Exposition and took first prize in pretty fast company. She was shipped from there to Trenton; the trip caused her to lose a lot of weight but at that she took third in the calf club class and sixth in the open. She also received a cup for being the best animal over all breeds in the county. She then went home and took first prize at the Community Calf Club Show.

The following year she again took first at the local show, showed a clean pair of heels to her class in Far Hills and took first in the open, took third in the calf club class at Trenton and in the open class of 25 animals which included the Carnation and Knowles Farm entries she took fifth, displacing one of the animals which had previously beaten her.

After the Trenton Fair, "Toots" and I went into a box car with two other boys and the rest of the New Jersey Calf Club calves and shipped for Syracuse. There we were to meet calf club entries from all over the country. She took third in her class.

An announcement was then made that a cup would be awarded to the best fitted and best shown calf club animal. "Toots" had been well trained and fitted but I again went to work on her using a sweet oil rag, pomace, and plenty of elbow grease. Again she justified my faith in her and won the cup.

Dad has been so pleased with the showing "Toots" made during the period of my ownership that he bought several well bred heifers from South Jersey as well as the top price cow at one of the state sales and a pure-bred bull of blue blood.

As "Toots" was due to freshen in January, we at once began to get her in condition for test. As this was our first experience at A. R. O. testing, we were very green. She fleshed up well and dropped a bull calf on January 8, 1924, which I sold for $50 ten days later. This was a fine coupon to cut from a $75 investment. Her bag was caked but perfect in shape with the teat well placed.

Due to our inexperience, we got her off her feed during test but even at that she made 363.2 lbs. milk and 13.61 lbs. butter as a junior two-year-old. I learned a lot from the test and also something about feeding. She is now milking 45 lbs. a day on two times a day milking and to top it off, she is looking better in milk than she ever looked as a calf or yearling.

I have come to the conclusion that a reputation can be made in the live stock and milk business and there is plenty of satisfaction in knowing that we can assure the people of Plainfield the best grade product which can be produced.

Yours for calf club work and farming,
Robert Krog.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

There is a good geography lesson in the August 22nd issue of Hoard's Dairyman. How many of you juniors know where Hongkong is? Get out your map of the world and find China. Right opposite the province of Kwang Tung, in the China Sea, is the island of Hongkong. No, it does not belong to China, as you perhaps may think. Although largely inhabited by yellow skinned, slant eyed people, it is a British possession.

The land is very rocky so there is little fertile ground upon which to grow crops, but with a population of a million or more, milk and other dairy products become essential. Thirty-eight years ago Sir Patrick Manson, who discovered the mosquito to be a carrier of malaria, founded the Dairy Farm Ice and Cold Storage Company, Ltd. of Hongkong.

How large is this institution? The company owns 1,000 cows, over 300 acres of land, and more than 100 up-to-date buildings for offices, dairies, and piggeries, all of which are modernly equipped.

How is milk produced? The central farm is some 500 feet above sea level and receives the full benefit of breezes every day in summer time. An overhead electric ropeway furnishes transportation to and from the farm and wharf. Cleanliness is emphasized above everything else. A rigid set of dairy regulations is posted for every employee of the company to follow. The milk is distributed by coolies in the hillier portions of the country, and on the lower parts of the city carrier tricycles and motor vans are used.

Discuss some of the sources of loss to the company. In one of the first importations of cattle, the ship encountered a typhoon and most of the cattle were lost. Serious diseases and epidemics in the company's herd have, on several occasions, caused great loss. Rinderpest, foot and mouth disease, and ticks have taken their regular toll.

Tell about the forage crops grown and their use. It has long been a problem to produce sufficient green fodder for the cattle. It has been found that guinea grass is the most suitable plant for local conditions.

When cut young this is a very succulent feed. It requires much land, being planted from fresh slips taken from old roots and being inserted at regular intervals about 30 inches apart. The surplus green fodder is converted into silage. Eight silos are scattered over the farm. These are built with stone against the hillsides. The silos are filled from a filling platform on the hillside.

What is the three-fold saving on sweet clover? Land, labor, and the cow's energy in the manufacture of milk. (See W. J. Fraser's article.)

How has the New York Experiment Station's Jersey herd been fed? Mature cows receive 1 lb. of the grain mixture for each 2½ lbs. milk testing 5½ to 6 per cent butterfat, calculated on the yearly basis. The grain mixture, with slight variations, contains about 18 per cent of the total crude proteins and consists of bran, oats, corn, and linseed oil meal in approximately equal parts by weight. Alfalfa or clover hay and corn silage are fed in addition to this grain mixture.

Junior Letters

Norman County Calf Club

Hoard's Dairyman Juniors:—I am thanking you for the fob and creed. I am going to memorize it, because I think it is a good one.

I am in a Calf Club. I joined it last year in April. I have a Holstein calf. I like the Holsteins the best of all breeds. We received our calves the 21st of April, 1923. There are 33 members in our club. This year some more joined. Now there are 65 members in our club. The name of our club is Norman County Dairy Calf Club.

WILFRED BAKKEN

The fair was the last day in June last year. All the calves were looking fine. We all were waiting for our calves to be judged, because we all wanted first place, but we all could not have it, and neither did I get it. Charles Teters was the lucky guy.

This winter 12 of the Norman County Club boys and girls went to Crookston, Minn., to the winter show. At Crookston I got 7th prize on my calf. Charles Teters got first again. Then the winners from each county had to go against each other. The girl that won the silver cup was Myrtle Himrum of Lake Park, Minn. Charles Teters got second. We were at Crookston all week.

Last year we had quite a few club picnics where we had good times. We would have different kinds of races and prizes were awarded the winners.

The president of our club is Alice Landro. She sure is a dandy president. She has been in club work many years so she knows something about it.

I am fifteen years old. Also find a picture of me and my calf, Peggy.

Minnesota. WILFRED BAKKEN.

The juniors mentioned in this letter are all members of Hoard's Dairyman Juniors Club. They have made great records. We are proud of them. Keep up the good work, Wilfred.

Keeping Records on Calf

Hoard's Dairyman Juniors:—My calf was five months old the 11th of July. I weigh her every month. When I entered her she weighed 282 lbs. and was 4½ months old. It weighs 343 lbs. now, being 5½ months old. It gained 61 lbs. last month. I feed her five and a half pounds of mixture feed; that is, barley, bran, oats, and oil meal, and I give her 18 pounds of milk a day. I keep her in a pen all by herself. I give her exercise every day, morning and evening. I did keep her blanketed but she won't keep it on any more, so I have to brush her so much more. I had her down to York Corner to our round-up. I took two prizes there. It is a nice thing for the boys and girls to be in a club of some kind. I am in three clubs: calf club, canning club, and sewing club.

My address is Northfield, Wis. I will answer all letters I receive. Agnes Hulett.

Makes a Rope Halter Successfully

Hoard's Dairyman Juniors:—I like to read the Hoard's Dairyman Juniors' page because it is always interesting and in each paper I find something of value about caring for dairy cattle.

Just lately I read the page where the Hoard's Dairyman shows how to make a rope halter for a calf. Then I tried it. It took me about three hours to make it because I would always get mixed up when I would be about half through. But now I'm glad I made it anyhow, because I know how to make one now and the next one would not take over half an hour for me to make. I have found out that ropes make good halters, too. Mine just fits my calf and I'm teaching her to lead, every day, with it. I did have some good experiences with my dairy calf last year.

Minnesota. Ruby Danck.

Potato Club Experiences

Hoard's Dairyman Juniors:—Received your letter and am sending you a picture of myself that was taken last year at fifteen years of age.

Last spring I received 2½ bushels of russet seed potatoes from County Agent Winslow. My sponsor was Abel O. Sterk. In the fall I had to give him back four bushels for pay. The rest I sold. I took good care of my potatoes and my father's also. They were both in the same field. In the fall we all took a peck of our best ones to the fair. Out of 248 pecks I won first which was $5 in gold. I did not take my potatoes to the state fair as I was too busy at home. Then a little later in the fall we all went to the potato banquet which we all enjoyed very much.

HAROLD L. HAUGH

In June we went camping for four days; everyone enjoyed that more than any other part of the club. I am a member of the potato club this year. We are going camping for seven days this year.

I am a Sophomore in high school and am taking up an agricultural course. Our farm contains 71 acres. We raise pure-bred Guernsey cattle.

Pennsylvania. HAROLD L. HAUGH.

Do You Agree With Ethel?

Hoard's Dairyman Juniors:—The Hoard's Dairyman for July 4, 1924, in the Junior Department, contained a *very* good article, "An All Around Farm Girl". It should help each and every junior to make the most of every opportunity and to look up at their clouds, rather than down, for the sun is sure to break through some time.

The pictures about how to get your calf ready for the fair are very helpful to the boys and girls, and I think they should tear out that page and keep it. "On Lake Mendota's Shores" is very interesting, and "Philosopher Phil Says" is really a good little thing to set us juniors to thinking what we say before we say it! "How I Won a Showman's Cup" teaches the young showman a few valuable lessons. The letters are extra good this month.

Kansas. Ethel Gordon.

Milking Makes Muscle

Hoard's Dairyman Juniors:—I live on an 85-acre farm 7 miles from the city of Loveland, Colo., a city of 6,000 people. I live near a large school house known by the name of "The Big Thompson" school. It got this name for the reason that it is near the Big Thompson river.

I will now tell you something about myself. I am 14 years old in April, extra large for my age.

I am a star athlete out of 100 pupils, holding first place in most all of the athletic sports in our school and Sunday School. Believe me, juniors, if anything will develop the muscles of a boy it is athletic sports. Three years ago I was a common weakling, but I began to take part in the athletic sports and now I hold first place in the track and inside sports. Here is another thing that applies to boys and girls both: If you want to develop the muscles of the arms, milk cows. Milking cows has helped wonderfully in developing my arms. I milk 5 cows night and morning. My father owns 20 Guernsey cows and one pure-bred heifer which is mine, besides a pure-bred bull.

I assure you that I will answer all letters I receive. So write. My address is Masonville Route, Loveland, Colo.

Forest N. Yockey.

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

A Farmer Boy Wrote It

The Farmers' Eagle and the Tinting and Mixing Chart were prepared for farmers by a man who grew up on a farm and knew farm problems. It was worked out to tell farmers what they would like to know about Eagle White Lead in Oil for farm painting, and to give them all needed information for its use. Working with this farmer-writer were the specialists of The Eagle-Picher Lead Company who had spent a lifetime studying paint problems.

When their work was finished, before it was printed, The Farmers' Eagle was submitted to practical farmers just to be doubly sure that it was a complete guide for painting on the farm.

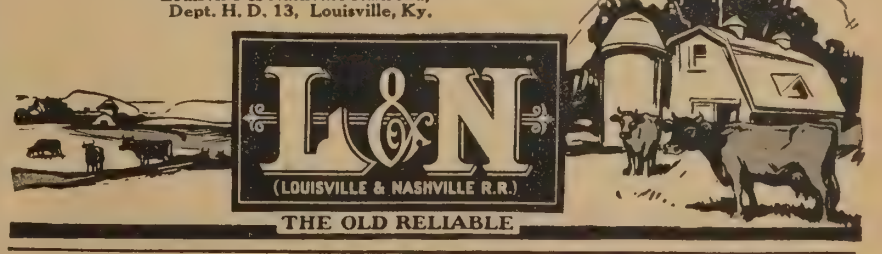
When Winter Comes

—and it is soon coming again—you will have to go thru these long months of physical discomfort from the snow and sleet and ice; and the expense of heating barns and of extra stall feeding.



Why not get away from all of this?

Move your family and your business down South, where you can work and live more comfortably and, through decreased overhead expenses, make more money for yourself and get more out of life for your wife and children.

There are many desirable communities in the South where fine farm lands, suitable for dairying operations, are available at comparatively low prices and on easy terms; taxes are lower; labor is plentiful and cheap; forage crops grow at all seasons; heating of barns is not necessary; roads are good; markets are within easy reach; and there is a ready demand and a good price for the things you produce.

It's worth your looking into anyway! Just write us how you are fixed now, so that we can give you the data which will help you the most.

Address **G. A. PARK,**
General Immigration & Industrial Agent,
Louisville & Nashville Railroad,
Dept. H. D. 13, Louisville, Ky.

Wanted—Reliable single man for small Guernsey herd. C. J. MINETOR, Altoona, Iowa. 6-2

Wanted—Young man, single, as herdsman in one the best equipped dairies in Maryland. Must be capable of managing men. Pure bred Holstein herd producing certified milk. Milking machines used. Salary $75.00 per month, board and room, to start. Only first class man considered, references required. Good opportunity. MILLARD L. RICE, Jr., Germantown, Maryland.

Married Herdsman—For Guernsey herd. De Laval milker used. Bulk milk sold. A. R. testing. Position open now. No liquor tolerated. In first letter give full details of experience, wages asked, and submit references as to character. Place also open for married man for general farm and dairy work. E. G. WOODWARD, Grassland Farm, Taconic, Conn.

POSITION WANTED

Superintendent, married, best reference, desires position on pure-bred dairy or stock farm. Address BOX 247, care Hoard's Dairyman. 6-2

Farm Manager—Open for position September 1st. Married, age 38 years, 2 children, 4 years in present position, managing 400 acres. Thoroughly understand farming, gardening, dairying and landscaping. Reference from present employer. In answering, please state full particulars. B. M. JARDINE, Lumberville, Pa.

Position Wanted—As milker of from 15 to 18 cows, while attending one year of high school. State nearness to school, number of cows, wages paid for such. KENNETH A. BROWN, R. 1, Janesville, Wis. 7-2

Position Wanted as Farm Manager—Age 25, single, experienced in general and dairy farming, graduate of farm management at Iowa State College. Best of references. DWIGHT H. OSBORNE, Walker, Ia.

Dry Hand Milker wants position. 20 cows to milk. Pay monthly. CHARLES H. TOBEY, Pine City, N. Y.

Married Man experienced, wishes position with large stock or dairy farm. Good hand milker. Address BOX 261, care Hoard's Dairyman.

Position Wanted—Farm foreman open for position. Married, life experience on large farms, understand stock and expert with horses. Address BOX 260, care Hoard's Dairyman.

Position Wanted by experienced feeder and test cow milker. Single, absolutely reliable. Address BOX 263, care Hoard's Dairyman. 7-2

Married Man, 28, one child, wants position on dairy farm. Life experience. State conditions and salary. Minnesota or Wisconsin. CLAUDE UPTAGRAFFT, Ladysmith, Wisconsin.

Position Wanted—Working herdsman, married, 38, thoroughly competent with pure bred cattle, official testing and feeding for test and production, calf raising, excellent butter maker. Open after Sept. 1st HERDSMAN, 4057 McRee, St. Louis, Mo.

Oct. 4—Holstein Dispersion. W. B. Barney & Sons, Chapin, Iowa.

Association Notes

(Continued from page 151)

The second cutting of alfalfa is ready to cut. One separator was tested and found O. K. One herd has just come through the T. B. test clean. Market milk sold for $2.30—$2.60 per cwt. The creamery paid 38—44 cents per lb. for fat.—C. L. Fleming.

Ottawa No. 1, Mich.: This association has just finished its first year. High cow, owned by John Park, produced 15,979 lbs. milk, 588.8 lbs. fat. Eighteen grade Jerseys, owned by Geo. Taylor, averaged 8,084 lbs. milk, 398.4 lbs. fat. Seventy-one unprofitable cows were sold from the route. The average production of 277 cows on test was 7,609 lbs. milk, 305.8 lbs. fat. Market milk sold for $2.60 per cwt. at Grand Rapids. The condensery paid $1.60.—T. McCarn.

Delta Co., Mich.: One new separator replaced a loser. Eight separators were tested and 7 found O. K. Three herds were tuberculin tested and one reactor found. The creamery paid 40—43 cents per lb. for fat.—C. R. Olson.

Prince William Co., Va.: The condition of the crops is very poor. The hay crop was much above normal. Wheat is threshing out about 6 or 7 bushels around this section. Some crops turn out as much as 20 bushels but they are exceptional. The association average dropped from 614 lbs. milk and 23.7 lbs. fat in June to 543 lbs. milk and 21.3 lbs. fat for July, due to the advancement in lactation period, dry, hot weather, and flies. The association expects to hold on the 17th of September a consignment sale of cows having cow test records with the standard for a mature cow of 300 lbs. fat.—T. T. Curtis.

Marion, Wis.: One machine shed was erected. One milk house was built and one barn remodeled. The cheese factory paid 40—43 cents per lb. for fat; the creamery, 42 cents.—S. E. Slotness.

Mt. Hope—Lancaster, Wis.: Thirteen members feed grain with pasture. Outside buyers pay as high as $150 per head for grade cows with cow testing association records. The local calf club has 7 members. The cheese factory and creamery paid 40—42 cents per lb. for fat.—B. G. Paulson.

Elroy, Wis.: Four cows produced over 50 lbs. fat; 23 over 40 lbs. Two herds averaged over 30 lbs. Ten separators were found not skimming clean. The creamery paid 44 cents per lb. for fat.—A. G. Steffen.

Mondovi — Gilmanton — Modena, Wis.: Thirty tons of oil meal have been distributed at $39 per ton. This was purchased co-operatively. Five herds were tuberculin tested and no reactors found. Two barns were whitewashed; 2 concrete silos finished.—W. E. Acker.

Central Monroe Co., Wis.: Twenty-eight reactors to the tuberculin test were found. One herd was wiped out entirely. One thousand pounds of bone meal were shipped in for cows. D. P. Jones sold 6 grade Guernsey heifers, coming 2 years old, on the strength of their dams' records in 5 years' previous testing, for $720. A few faulty separators were found. One man installed a double unit electrically driven milking machine. Another is building a milk house and installing steel stanchions, drinking cups, and concrete stalls. The condensery paid $2.00 per cwt. for milk; the creamery, 46 cents per lb. for fat. Milk retailed for 8 cents per quart.—V. Sorenson.

Greene Co., Mo.: Of the 250 cows tested, 17 produced over 40 lbs. fat, 4 over 50 lbs., and 6 over 1,000 lbs. milk. Nearly all dairymen are trying to have legume hay by sowing soy beans and cowpeas. Some plan to build silos. Market milk sold for $2.50 per cwt. and retailed for 10—14 cents per quart. The creamery paid 38 cents per lb. for fat.—V. L. Gregg.

Cass Co., Mo.: The 10 high cows ranged from 49.2 lbs. fat, the lowest, to 71.2 lbs., the highest. Several dairymen have expressed their intention of attending the National Dairy Exposition and going on the tour through Southern Wisconsin from Kansas City. The cow, Financial's Queen of Coleman, that recently broke the state record, is owned by a member of this association; also the famous Jersey sire, Rawleigh's La-Rilla Lad, considered the third greatest Jersey sire in the breed. This animal was recently loaned to the University of Missouri.—D. Pitney.

Hammond—Baldwin, Wis.: During the testing year, which ended last June, a total of 546 cows were tested, of which 332 were tested a full year. Forty-three cows produced 365 lbs. or over; 21 over 400 lbs.; 4 over 450 lbs.; and 2 over 500 lbs. Eight herds averaged over 300 lbs. fat. The association average is 7,044 lbs. milk, 271.7 lbs. fat. The high cow, owned by A. J. Wieberdink, is a registered Holstein. She produced 17,538 lbs. milk, 547.5 lbs. fat, making a profit above feed cost of $182.35. The high herd, owned by Fred Geurkink, consisted of grade Guernseys with a production of 7,620 lbs. milk, 377 lbs. fat.—O. Berkseth.

Kentucky Holstein Club Reorganized

A re-organization of the Kentucky Holstein-Friesian Club was started at the fifth annual convention of that organization on August 6th on the farm of R. M. Barker. Fifty breeders were in attendance. Mr. Barker was elected president; Lindley Henderson, vice-president; and Otis Ashurst, secretary-treasurer.

A committee consisting of D. C. Clark, Carl Giltner, and Professor J. J. Hooper was appointed to prepare a constitution and set of by-laws for the club and a program of work for the coming year. Stanley Combs, southern field representative of The Holstein-Friesian Association of America, is assisting in working out a program. A complete report of the program planned will be submitted at a meeting of the club to be held at the Seelbach Hotel, Louisville, September 11th.

Some of the speakers on the program that followed the business session were E. M. Prewitt of the Kentucky College of Agriculture; Mr. Clark, Allie Pearce, John Null, and Mr. Combs. A judging demonstration followed in which a number of cattle of the Barker herd were compared with the true type cow and bull models by Professor Hooper, who is one of the official judges of the National Holstein Association.—Extension Service, Holstein-Friesian Ass'n. of America.

The Illinois College of Agriculture will send a carload of animals to the National Dairy Show. An exhibit of feed for dairy cows, in which the college has been specializing, will also be shown, officials report.

HOLDEN Lime and Fertilizer **Spreader**

Sour soil means poor crops. Experts agree fertilizer is useless on sour soil—it must have lime. The "Holden" Spreader makes bigger crops. Guaranteed to handle lime in any form, fertilizer, phosphate, gypsum, wood ashes or crushed shells. **Cannot Clog. Try Spreader 10 days Free.** The Holden Lime and Fertilizer Spreader will make your soil healthy and productive. Spreads twice as far as any other; 16½ ft. Attaches to any wagon or truck. No holes to bore. Spreads evenly 100 to 10,000 lbs. per acre Handle material only once, from car to field. Get literature and low prices now and ask about 10 Day Free Trial.

Soil Tested-free

What about your soil?—your crops? Are they big and sturdy as they should be? Find out today with our free Litmus Test Papers—positive sour soil test recommended by all soil experts. Write for them now.

SALE Complete DISPERSAL of Holstein Dairy Cattle

SEPT. 3d, 1924
SALE CALLED AT 1 O'CLOCK P. M.

FIFTY HEAD OF CATTLE consisting of 3 registered cows, 1 registered bull, 40 head of high grade cows and heifers, and 6 head heifer calves. Ten of these cows to be fresh this fall, 5 to be fresh at time of sale, and 16 head heifers to be fresh within the next two months. This herd is of our own raising and each animal is well bred and grown. This herd has been headed by Fairlawn Fobes Ormsby 241510, a paternal cousin of Sir Pietertje Ormsby Mercedes. Herd is under federal supervision. Sale to be held on farm one mile west of Iowa State College Dairy Farm, Ames, Iowa.

SEARLE DAIRY, Owners

POULTRY On The DAIRY FARM

The Accredited Poultry Flock

HOARD'S DAIRYMAN:—The accredited farm poultry flock corresponds to the cow testing association herd of dairy cows. That is to say, chickens are judged according to their performance—ability to produce eggs. For instance, in Nebraska a hen can not qualify for the accredited farm flock if she demonstrates a markedly inferior egg production, evidences a lack of breed characteristics, is diseased, or is of inferior size. Such a hen is eliminated from the flock before November 1, each year.

These are negative qualities of an accredited farm flock of poultry. Among the positive virtues required are: Flocks must have 50 or more producing birds, standard-bred within the breed and variety; must have an average production of 85 eggs the first year, 100 eggs the second year, 115 eggs the third year, 135 eggs the fourth year, and 150 eggs the fifth year; males used for breeding purposes in the accredited farm flock are required to conform to the breed characteristics and have egg production blood lines representing not less than 125 eggs the first year, 150 eggs the second year, and 200 eggs the third, fourth, and fifth years; hens shall be fed for egg production; and the management of the flock shall be such as to create a most favorable environment.

The accredited poultry flock project in Thayer County, Nebraska, is a noteworthy example illustrating the methods employed and the results achieved in this extension activity for improving chickens kept on farms. All told, 25 flocks containing an average of 3,549 hens were enlisted in the project upon its completion. These birds produced 49,140 eggs or an average of 138 eggs to the hen in the course of twelve months. The sale of eggs from these hens represented an income of $10,030.04, and the sales of poultry contributed an additional $3,192.04. Thus, the farmers owning these 25 accredited flocks received a total of $13,222.08 for poultry and poultry products in one year. On the other hand, the cost for feed was $2,480.32, which accounting does not take into consideration the feed picked up by the hens around farmyards.

One large flock, maintained on a 10-acre farm, required that all of the feed eaten by these chickens be purchased. This expenditure represented $1.07 per hen, although the average feed cost of all of the birds in the 25 flocks was only 70 cents for each hen. The feed cost to the contrary, the farmers sharing in the benefits of this accredited flock project received $10,741.76, or $3.05 per hen, above the cost of feed. The financial returns from the most prolific egg-producing flock was $5.52 per hen and the income from the poorest flock was 67 cents per hen.

If this Thayer County, Nebraska, experiment is to be accepted as a criterion, the light breeds of poultry are greater egg producers than the heavy breeds. The former averaged 148 eggs per hen and the heavy breeds 121 eggs to the hen. This represents a margin of 27 eggs in favor of light breeds of chickens as egg layers. On the other hand, the heavy breeds offset this handicap with respect to stock sales, since when disposed of in the form of meat the light breeds made an average of 64 cents per hen and the heavy breeds $1.39 per hen. The latter comparison, however, cannot be accepted on its face value since the sales of poultry stock included young as well as mature and breeding chickens. Moreover, 54.09 per cent of the heavy breeds were marketed during the year, while only 37.53 per cent of the light breeds were sold. All of which is responsible for the following comment of L. C. Christie, county agricultural agent of Thayer County: "Due to these facts the returns for the year favored the heavy breeds. They returned a total of $3.19 per hen above feed cost and the light breeds $2.94 per hen."

The accredited poultry flock project in Nebraska has assumed formidable proportions. More than 200 farms are enlisted in the work, representing 28,876 hens. Nearly 15,000 hens were culled because they were unprofitable. The eggs produced by these improved flocks of chickens in one year totaled 254,214 dozen, or a few more than 21 carloads. The income from the sale of eggs and fowls was $63,553.50, whereas the expense of feeding was $15,441.38. Thus, the net income from these chickens, fed for egg production, was $58,162.12, which is equivalent to a net income of $2.16 per hen.

S. R. WINTERS.

Feed at Fault

I am writing to ask advice from you about our chickens. To begin with, we hatched them in April, about 40, and they hatched fine. We fed them, to start with, baby chick feed and buttermilk mash with a little rolled oats. They did not eat the mash very good dry so I made it crumbly moist. When they were about six weeks old we fed coarser scratch feed and growing mash. A few weeks ago we began to feed boiled wheat and scratch feed morning and night and boiled mashed potatoes mixed with bran and some of the growing mash at noon.

We have White and Buff Rocks. The white ones did not grow so very good from the start, long drooping wings and small for their age, but the Buffs grew fine until a few days ago when they began to get sick, first the Whites and then the Buffs. Some are sick a day or two and others longer.

Dousman, Wis. C. J. H.

The difference which you have noted in the vigor and vitality between the White and Buff Rocks is undoubtedly just a characteristic. You just happened to get a vigorous bunch of Buff Rock chicks, while the White Rocks were lower in vitality or else conditions have weakened this factor to a certain extent. There is really no difference between the two varieties except breed lines that have been established back of them.

I should judge from the description which you have given here that your feed has been too sloppy and there wasn't enough hard material in it for chicks that were in confinement. Whenever it is necessary to restrict seriously the range, one will find that a great deal better results can be obtained by allowing them a heavy grain feed with a correspondingly smaller amount of dry mash and practically no wet mash at all. This point was very well stressed this spring during the weather that we had throughout the state when people that insisted upon keeping the chicks shut in during that time experienced a serious loss, while those allowing them to run out came through all right, and also those that compromised by keeping the chicks closed in but taking away the mash feed and allowing practically nothing but grain feed or mash for only a short time in the middle of the day, were also able to bring them through satisfactorily. One farm that I recollect at this time had two lots. One was closed in and given dry mash continuously, and these chicks went to pieces while the other chicks that were handled in the other way came through in very fine shape with practically no loss.

I don't believe that there is any disease present in these chicks, but I would take away the moist feed which you are giving them, feed them heavier on grain feed about three or four times a day, keeping them just on the edge of being hungry at all times, supply an abundant amount of green feed, and if possible give them some form of milk to drink until they come back into condition again. After this is done the dry mash can gradually be returned and by cutting down on the amount of grain feed the mash consumption can be greatly increased.—J. B. HAYES.

There'd Be More Money in Cream and Eggs If ---

—producers paid closer attention to quality. The United States Department of Agriculture, in a report of the defects in the quality of butter, states that producers and manufacturers of inferior quality dairy products receive annually several million dollars less than they would if they did not permit imperfect conditions and methods in production, marketing and manufacturing.

The same thing is true with eggs.

These are perishable products, and proper production and handling have everything to do with quality, and quality has everything to do with the price received.

Quality Begins With Production

Here are two products whose faults are easily detected. The consuming public, as a whole, is willing to pay more for good butter and eggs, but a degree of goodness consistent with higher price is not possible unless quality starts with production—on the farm.

The Chicago Mercantile Exchange—whose large "spot" and future trading markets give it first place in the distribution of butter and eggs—speaks from experience and authority when it says that more painstaking methods in the production of these food essentials will bring to the producer prices that make such care and labor highly profitable.

CHICAGO MERCANTILE EXCHANGE

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Sudden Blindness

Farm animals sometimes suddenly lose the power of seeing, yet the eyes show no sign of disease and indeed are particularly bright appearing, the pupils being much dilated, a fact which has led to the term "glass eye" as a name for the condition in the horse. In that animal the trouble usually proves permanent and incurable and as concerns a stallion it has been considered fit cause of disqualification for public service, as it possibly may prove hereditary as a tendency. In all animals it is liable to occur from any great shock to the system. We have seen it attack animals immediately after castration or any operation that has caused a considerable loss of blood. It may also result from a serious attack or derangement of the digestive organs and be a symptom of cottonseed meal poisoning. In the latter condition, however, one notices a blood-red ring around the pupil which is absent in other cases; for in most instances of the disease inflammation is entirely lacking.

The disease technically is termed amaurosis or "palsy of the sight" and is a paralysis of the retina and optic nerve of the eyes. It may be seen at birth in some calves and foals and we have seen it follow difficult calving, in which case it may subside in time; but it tends to remain as a permanent condition when caused by loss of blood, an operation, or difficult parturition. But the form of the ailment to which we particularly wish to draw attention here is amaurosis suddenly affecting a cow during the latter part of pregnancy. She simply becomes blind, yet not a thing can be seen amiss with her eyes. They do not close and weep, neither is there swelling of the eyelids and redness of the lining membranes, such as is seen in conjunctivitis, or "pink eye". The pupils are dilated and the eyes peculiarly bright as if belladonna or atropia had been applied or administered. Apparently the blindness is caused by undue pressure upon nerves, or is reflex from such pressure, but possibly it is due to some effect upon the brain by elements absorbed into the blood circulation in association with the pregnant state. The exact cause is unknown.

Hardened Quarter

We have a Guernsey heifer that will be fresh in August. The last few days she has come in with one rear quarter hard as can be. Could you advise me how to treat this heifer? She does not show signs of having been sucked or hurt in any manner, no bruise or cuts, nothing from exterior appearance.

Cape Girardeau, Mo. A. H. M.

As often stated here such a condition of a quarter of the udder of a heifer is sometimes caused by calves sucking the teat at the time of life when calves are penned together and fed on skimmilk. The sucking causes secretion of milk in the udder and when the calves are separated the milk may curdle and a slight attack of garget result. To prevent that, calves should be stanchioned when fed milk and be given dry meals after the milk and before turning them loose. Sucking of the udder should be prevented. Bruise would be another possible cause. Treat by fomenting the quarter several times daily with hot water, stripping away some of whatever fluid is found present and in the evening rubbing in warm melted lard containing 1 dram each of turpentine and fluid extract of poke root per ounce. Thorough hand massage is most effeetive.

Warts

Please send us a remedy for warts on cow's teats.

Wisconsin. F. R. A.

Warts that have thin necks may be snipped off with scissors, a few at a time; then apply tincture of iodine. Twice daily for at least 5 minutes saturate the teats in water containing all the bicarbonate of soda it will dissolve when hot. Then dry gently and apply a thick paste of salt, flowers of sulphur, and cold pressed castor oil.

Controlling Abortion in Cattle

(Continued from page 148)

for abortion control as the annual test is for tuberculosis control.

A Program for the Infected Herd

1. Test all animals to identify those not infected.
2. If the percentage of reactors is below 15 or 20 sell them to the butcher.
3. Clean the barn thoroughly. Remove all litter, bedding, straw, feed, cobwebs, and dust that could possibly have had contact with the infected cows.
4. Disinfect the barn by wetting thoroughly all woodwork and concrete with a 5 per cent solution of compound solution of cresol.
5. Before bringing the abortion-free cattle into the disinfected barn wash their feet, legs, bellies, and tails in a 3 per cent solution of compound solution of cresol.
6. Clean out the yards, pens, and corrals where the infected cows have been by piling and burning the trash and litter and raking up all the manure and hauling it to some cultivated field.
7. Sprinkle chloride of lime freely on the cleaned yards and turn it under. If possible allow three to six weeks of sunshine on these yards before any cattle are placed in them.
8. Test the herd each 30 to 60 days, removing any reactors. Keep this up until the herd has passed three successive tests. Frequently there will be some reactors on the second test and occasionally one or two will be found on the third.
9. When a clean herd has been established keep it clean by following the program for such a herd as outlined above.

For a Badly Infected Herd

If the first test reveals a very high percentage of reactors the best procedure depends upon the records of the reacting cows. The production of the reactors as a group should be studied. This is usually so low that they are not profitable. If they are profitable sell them to the butcher. Then proceed as outlined above.

If the reactors are showing a profit separate them from the healthy animals. Handle the abortion-free animals according to the program already outlined. Handle the reactors as follows:

1. Keep them in a separate barn, run them in separate pastures, and do not ever allow them to come in contact with the disease-free herd.
2. Have separate caretakers for the two groups of cattle.
3. Remove calves from the infected dams when they are three days old. Feed them milk from the clean herd for two or three months. Then they may be placed with the calves of the clean herd. When removing calves from the infected herd always wash their feet, legs, bellies, tails, and rumps with an antiseptic solution before they are placed in the clean barn.
4. As the reacting cows become sterile or unprofitable from any other cause sell them to the butcher.

"The greatest glory is not in never falling,
But in rising every time we fall."

Edgerstoune's Luxury Bond

A Promising Young Bull For Sale

His sire, Sandhill Premium Bond Imp., was a first prize winner in Scotland as well as a National Dairy Show winner in this country. His dam, Nether Craig Luxury, 2nd at the 1923 National Dairy Show, has a record of 13,742 lbs. milk 594.36 lbs. fat. This youngster is a promising prospect as a show bull and as a herd sire. Write today for price and pedigree.
EDGERSTOUNE FARM, Geo. A. Hill, Mgr., Princeton, N. J.

New York Experiment Station Jerseys

(Continued from page 149)

has been subjected to 858 tuberculin tests. The test showed six animals to be tubercular which were later proved tubercular. Since 1905, the tuberculin test has shown three animals as tubercular which displayed no evidence of the disease. Three possible errors in 858 tests are as accurate as one could ever expect such a test to be. Such inaccuracies are very minor when one considers the fact that the Station herd has had no tuberculosis since 1905, a period of 18 years.

Table 2—Tuberculin Tests on the Healthy Herd, 1901 to 1922 Inclusive

Date tested	TESTS ON ISOLATED HEALTHY HERD: Total No. tested	No. of reactions	Remarks
1901, Oct.	17	4	Disease developed since last test
1902, June	13	0	
1902, Dec.	13	0	
1903, April	15	0	
1903, Dec.	20	0	
1904, May	24	1	Reactor brought from untested herd
1904, Nov.	25	0	
1905, May	28	1	Reactor proved tubercular
1905, Nov.	30	0	
Total	185	6	Every reactor was tubercular
TESTS AFTER NO DISEASED ANIMALS WERE ON THE PREMISES			
1906, May	24	0	
1906, Nov.	37	0	
1907, June	30	0	
1907, Nov.	34	0	
1908, Oct.	36	0	
1909, May	39	0	
1910, Sept.	40	0	
1911, Oct.	35	0	
1912, Oct.	36	0	
1913, Dec.	29	0	
1914, June	34	0	
1915, May	33	1	No tubercular lesions
1916, May	32	0	
1917, May	32	0	
1918, May	33	0	
1919, Oct.	30	1	No tubercular lesions
1920, Oct.	32	0	
1921, Oct.	32	0	
1922, Nov.	33	1	Intradermal and ophthalmic tests negative
1923, Nov.	42	0	
Total	673	3	No proved tuberculosis
Grand total healthy herd	858	9	Six had tubercular lesions

The herd has been kept free from the disease for 18 years by carefully observing the precautions against reinfection which have been taught by those most familiar with the disease. The tuberculin test has served as the means of locating infected animals so that they could be removed from the herd.

(EDITOR'S NOTE: This is the third of a series of four articles by Mr. Dahlberg on lessons from the herd experience of the Geneva Station for the past quarter of a century. The next will appear in an early issue.)

Does Official Testing Pay?

Official testing causes only a very small amount of extra work and involves only a reasonable expense, and yet many breeders and dairymen who should be carrying on official testing hesitate to do so.

Many breeders undoubtedly have individuals in their herds which if officially tested would make a good showing, and in some instances might even put up a remarkable performance. A case of this sort occurred in California, and it will probably be of interest to all breeders and dairymen.

The Alta Cresta herd, owned by Mr. A. W. Nolan of California, had been in the course of development for the last twenty years, but no official testing had been done. In 1922, Mr. Astroth, fieldman of the American Jersey Cattle Club, persuaded Mr. Nolan to put some of his Jersey cows on Register of Merit test. None of these cows had ever been tested before but the results obtained were exceptionally good.

During the past year two state class records have been broken, and one gold and one silver medal have been won. Two more cows now on test are also reasonably sure to win gold medals.

Onward Girlie Bertha, owned and bred by Mr. Nolan, has just finished a test in which she produced 710.33 pounds fat in 365 days. Bertha is expected to calve very shortly and on this record she should qualify for a gold medal and for the state junior three-year-old Jersey championship.

Jewel Princess of A. C. also completed a year test in which she produced, with calf, 672 pounds fat. This record won for her the Jersey senior three-year-old championship of California as well as a silver medal awarded by the American Jersey Cattle Club.—American Jersey Cattle Club.

BROWN SWISS

ANNOUNCEMENT

KINNELON FARMS, owned jointly by Warren & Morris Kinney and for thirty-four years the home of pure-bred Brown Swiss cattle, announces herewith a reorganization, change of name ownership and location.

The entire herd was moved during the month of August, to Lees' Hill Farm, at New Vernon, N. J., with Post Office at Morristown, and will be known henceforth as the Lees' Hill Farm herd. Mr. and Mrs. Warren Kinney are the new owners, Morris Kinney having recently sold out his interest to them.

The management will be the same as heretofore and a constructive breeding plan for the improvement of type and production will be carried on. Brown Swiss breeders are urged to associate the name "Lees' Hill" with "Kinnelon". It means the same blood, backed by the same high records, and under the same intelligent management.

Herd fully accredited, Certificate number 65301

10 others from 907 to 986 lbs. butter. 18 cows average 1021.07 lbs. butter and 23671.4 lbs. milk. Bull calves from yearly record cows. Send for pedigrees.
BUREAU OF ANIMAL INDUSTRY
Department B Lansing, Michigan

A Carload of Young Registered Cows
From our herds and those of our neighbors you can select a carload of young cows bred to freshen this fall and early winter at very reasonable prices. Let us describe them to you, or come and see them.
CARLETON COLLEGE FARMS, Northfield, Minnesota
Federal accredited herd

A YEARLY RECORD BULL --- Ready for Heavy Service!
BORN JANUARY 23, 1923
We offer one of the good sons of SIR WALKER SEGIS HOMESTEAD, (a proven show bull with 32 A. R. O. daughters) who is a son of "PIEBE" out of a 1230-lb. world record daughter of "COUNT." His dam as a three year old heifer made 20853 lbs. milk and 753 lbs. butter in 305 days. The two nearest dams of this bull average 991 lbs. butter on long time test. He is quite dark in color, a good individual and priced for a quick sale. Send for pedigree and photo.
A. J. LASHBROOK Northfield, Minnesota

Sir Walker Segis Homestead

Grahamholm Herd
We are using Dutchland Creamelle Colantha Lad and Duke Pietertje Korndyke Ormsby on our select herd of over 100 females. We have a few serviceable sons and grandsons of "Dutch" and some of "Duke" for sale; also some calves that will soon be ready for service.
GRAHAMHOLM FARM,
D. G. Tweatyman, Manager Rochester, Minnesota

BUY YOUR HOLSTEINS
where you can get good, clean cattle at fair prices—where an experienced, reliable man will give you every assistance free of charge. Grade or pure-breds in any number you wish. **JEFFERSON COUNTY HOLSTEIN SALE ASS'N., A. F. Gafke, Sec., Jefferson, Wis.**

Richly Bred Holstein Bull Calves
out of A. R. dams and sired by our two richly bred herd sires—**King Piebe Ormsby Mercedes**, a 35-lb. son of Sir Korndyke Bess and every dam in pedigree over 22 lbs. and **King Pietertje Mercedes Ormsby**, a son of Sir Pietertje Ormsby Mercedes and out of a 19-lb. senior two-year-old dam.
Herd tuberculin tested. Write for information or visit herd.
P. FROST SPAULDING FARM CO
C. L. Spaulding, Mgr. Warren, Minn.

For $250
Son of a 1024-lb. yearly record granddaughter of King of the Pontiacs. Grandson of Sir P. O. M. 41st. Born Nov. 8, 1923. Splendid individual, good size, mostly black.
B. A. NORRIS, ANOKA, MINN.

HOLSTEINS and GUERNSEYS, For Sale
We have from 100 to 500 high grade and registered cows and heifers for sale at all times. Also choice registered bulls of each breed. These cattle come from the best herds in western Wisconsin. They are selected from the largest federal tested territory in the state and are assembled in the largest and most sanitary sale barn in the northwest.
West Salem is on the main line of the C. M. & St. P. and of the C. &. N. W.
Write us or better still come and select just what you want.
O. G. CLARK & CO., - - - - WEST SALEM, WISCONSIN

A YEARLY RECORD HERD
The Clover Lawn Farm Holsteins. 150 head. 60 cows with yearly records. 20 young bulls, one month to 2 years old for sale, sired by King Longfield Pearl Vale, whose dam made 1225 lbs. of butter 26,050 lbs. milk a year. Can spare a few choice young cows. State exactly what you want.
JOHN H. PULS - - ALLENTON, WIS.

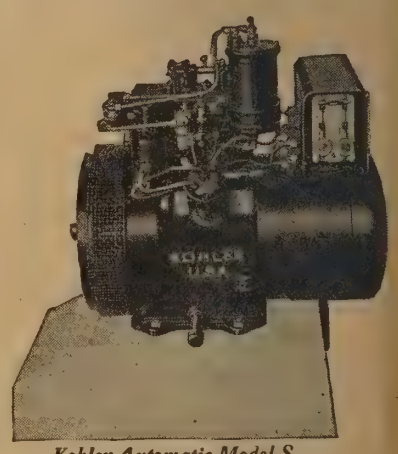
Light, power, running water— *turn them on!*

THERE is no need any longer to carry your light with you in oily lanterns. No need to depend so largely on human muscles for power for doing treadmill chores. No need to break backs over buckets of water.

A simple, dependable, economical Kohler Automatic Power and Light Plant is ready to light your buildings with safe electricity, do dozens of hard jobs in the house and around the farm, and pump running water wherever you want it.

The Kohler Automatic is designed to give *complete* electrical service for every farm need. It is a light plant. It is a power plant. It is wholly automatic—no running to the plant to start it! It generates far-carrying 110-volt current and operates standard appliances.

Most important of all, it *does not need storage batteries* (except a small starting battery). It delivers its steady flow of current direct from the generator to the point of use—with an efficiency, economy, and trouble-free reliability which are the marvel of every owner.



"WE have had our Kohler Automatic a little over three and one-half years. It does our pumping, washing, ironing, cream separating, vacuum cleaning; runs the grindstone, fanning mill, and does light grinding. We have thirty-eight lights in our dwelling, yards and barns.

"I consider the operating expense very low. Its construction is such that its consumption of oil and gasoline is very meagre. It needs but little attention and is very economical."

[Signed] *Jas. A. Patterson,*
Clifton, Kansas

For as little as $435 you can buy an 800-watt Kohler Automatic embodying all these principles of advanced design. And this price, remember, is for the plant complete, including starting battery and 55-gallon gasoline storage tank—on easy payments if you like.

There is an extremely interesting 48-page booklet which tells all about the remarkable work which the Kohler Automatic is doing. Every progressive farmer who wants to know how to get the most out of electricity should have this booklet. It is yours for the asking. Just mail the coupon.

Kohler Automatic Model S
800-watt; 110-volt, D. C.
Other models, manually or automatically started, 800- to 2000-watt capacity; price range, $360 to $795, complete with starting battery (for automatic units) and 55-gallon gasoline storage tank with fittings

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LXVIII, No. 8 Fort Atkinson, Wisconsin September 5, 1924

The concrete road illustrated is 20 feet wide; the thickness at edges, 10 inches; at center, 7 inches.

The 1923 output of Lehigh Cement—16,500,000 barrels—would build over 3700 miles of such roadway.

Thousands of miles of concrete roads made of Lehigh Cement are today in actual service throughout the country.

The Lehighway from Coast to Coast

The 16,500,000 barrels of Lehigh Cement sold in 1923 would have made a concrete highway, 20 feet wide, linking New York to San Francisco—over 3000 miles long.

This immense output, however, was used not only in the construction of roads but in building homes and office buildings, bridges and barns, and thousands of other modern improvements throughout the nation.

Today thousands of barrels of Lehigh Cement are being shipped to city, town and country to satisfy the increasing demand for high quality portland cement.

It is this volume, the largest in the industry; it is the nation-wide distribution through thousands of dealers; it is the quality of the product; it is the location of the mills, 16 from coast to coast; it is the complete service rendered to dealer and user, prompt, fair and square; it is all these things that measure the popularity of Lehigh—The National Cement.

There is a Lehigh dealer near you. He can be identified by the blue-and-white Lehigh sign. The next time you are in need of a good portland cement, ask for Lehigh.

EVER FAILING OR NEVER FAILING PASTURE

Growing Six Months' Feed

Part 10.

WILBER J. FRASER, University of Illinois

THESE articles have cited much experience showing the inevitable failure of bluegrass and the surprising advantages and economy of sweet clover pasture. But troubles have been found and failures have occurred in growing this crop and, for this reason, many imagine that sweet clover is a difficult and uncertain crop to produce. It is worth all the effort necessary in raising it to have the pasture that brings the results the hundred men answering the questionnaires report. We must have the sweet clover if it is at all possible to produce it. So the most successful procedure has been studied in many fields, has been learned from many growers, and has been tested out on my own farm for several years. And the following seems to be a real guide to success.

The Two Great Essentials

Sweet clover does, however, have two requirements that are absolutely essential to its growth, namely: soil that is not acid and inoculation. Complying with these requirements makes the difference between success and failure in raising the crop. Experienced growers, almost without exception, report no trouble in securing a stand after the soil has been limed and inoculated where needed.

This is a new crop and it is not strange that many growers should at first overlook or ignore this preparation. These two requirements are being taught by farm advisers. They are pointing out scores of failures caused by lack of lime or inoculation, and citing other hundreds of successes where they are supplied. These are among their principal demonstrations and are well established facts, which are now coming to be generally known.

Always Test the Soil

Two tons per acre of ground limestone are ordinarily needed, but where the soil is very acid, four or five tons may be required. The soil should be tested in all cases before seeding sweet clover to discover whether the soil is acid and whether it needs much or little lime. The Mather Test—known to every farm adviser and every agricultural student, even in high school—will tell the story in two minutes.

Sweet clover often grows along the fence row or roadsides, and people make the mistake of concluding from this that their soil is not acid. The fence row has not been cultivated and hence has not lost its lime, while the tilled field adjacent has been worked for many years and is quite likely to be deficient in lime. The soil for two or three rods from the fence along a gravel or macadam road is usually sweetened by the lime dust that blows from the road, and for this reason, sweet clover may grow along the road when it will not further back in the field. The ground limestone should be applied and mixed into the soil three or four inches deep, at least six months before seeding.

It has been found by many actual tests, as well as by the luxuriant growth of the sweet clover, that one application of ground limestone will keep the soil sweet for ten to fifteen years. On one field of very acid soil, with which I am familiar, four tons of limestone were applied 20 years ago, and sweet clover still grows luxuriantly. Sweet clover seeded on acid soil will usually make a start and cause the farmer to think he is going to get a stand, but later in the season it turns yellow and dies.

See What the Growers Say

"Last year was the first I had success with sweet clover. I sowed it two years before on the same field without having it limed and got a good stand, but in the fall the plants turned yellow and died. This shows that we can not grow it on acid soil without lime."—U. Greenfield, Northern Illinois.

"I sowed 20 acres of sweet clover and there was only about three acres of the 20 that had been limed. I got very little sweet clover except where the land had been limed. It is useless to sow the seed here unless the land is limed."—Wm. Croddy, Southern Illinois.

"Where the soil is acid, limestone must be used. The first year's stand is usually not as good. The next year the acidity of the soil has been neutralized and the soil better inoculated, and this insures a better stand."—Bernard Schilling, Southern Illinois.

The Best Variety to Raise

Biennial white sweet clover is the kind recommended for dairy pastures. It will frequently grow successfully where alfalfa and other clovers will not grow at all. It is a sure "catch" when sown on sweet and inoculated soil. With ten consecutive years' seeding at the University of Illinois, a stand was obtained every year, while in the same ten years only five stands of red clover were secured. This variety of sweet clover develops such large, deep roots that it withstands the drouth, withstands heaving in the spring if allowed a fair growth the summer before, makes the most pasture, and is most beneficial to the crops that follow. Care should be taken in buying seed to get this variety rather than some smaller strain or the annual Hubam.

R. L. Black of Central Illinois in seeding 40 acres of sweet clover got Hubam by mistake, with the result that the second year he was entirely without pasture for his large herd for three and a half months—a tremendous loss.

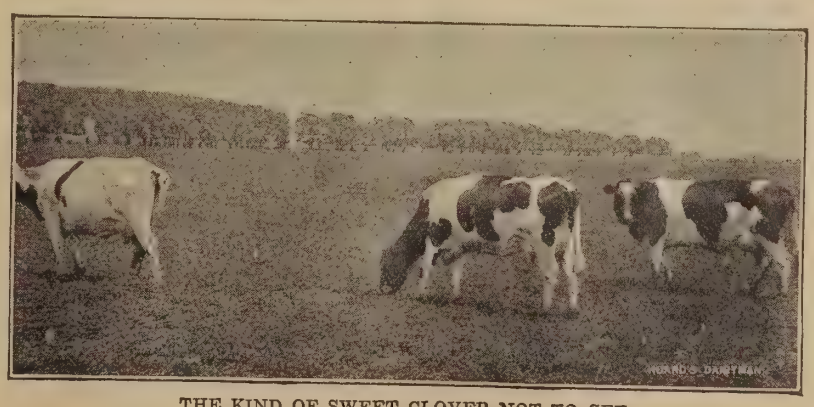
The smaller biennial varieties do not produce as much feed per acre and they die sooner the second year before the new seeding in the grain stubble is ready, making a very awkward and expensive break in the pasture season.

Important to Have Scarified Seed

The seed should be scarified to break the hard coating in order that it may germinate more readily the first year, and a good stand be secured. Scarification has been known to raise the germination from 25 to 97 per cent.

Amount of Seed

A wide difference of opinion exists among farmers as to the amount of seed to sow per acre. I have raised sweet clover on my own farm for 10 years and never sowed over five pounds per acre, yet have always gotten a good stand where the small grain did not lodge and smother the young clover.



The 81 questionnaires received this spring showed that some farmers sowed five pounds while others sowed as much as 20 lbs. per acre. Some of the men reported excellent stands and others thin to medium stands, whether a small or large amount of

(Continued on page 187)

No Luck to Growing Sweet Clover

Sweet clover has two requirements that are absolutely essential to its growth, namely, soil that is not acid and inoculation. Hundreds of men have tried growing sweet clover without providing these conditions and have failed, while their neighbors who did provide them, succeeded.

The biennial white variety is the best for pasture because it develops large, deep roots that enable it to provide a more continuous growth and withstand drought better. This variety also affords a longer pasture season.

THE KIND OF SWEET CLOVER NOT TO GET

"The mistake of sending me biennial yellow instead of the biennial white sweet clover seed has damaged me a thousand dollars, because my cows will be out of feed most of the time until the new crop is ready in two months," said Dan Meade of Northern Illinois. This clover pasture had a big start, being 10 inches high May 10, when 29 cows were turned on 26 acres. But on June 26 when the picture was taken, it was eaten tight to the ground and had nearly stopped growing for the season, after furnishing feed for less than seven weeks.

SHOWING THE EFFECT OF LIMING ACID SOIL

Sweet clover was seeded on all this field. The portion to the left was limed, and here the sweet clover made a good stand. On July 18, 1923, when the picture was taken, the clover was three feet high and nearly ready to cut for seed.

On the part to the right, where no lime was applied, scarcely a single sweet clover plant could be found.

MR. McKNIGHT AND A GROUP OF HIS YOUNG STOCK

SIXTY-FIVE FROM ONE

A Story of a Pure-bred Cow on a Connecticut Farm

WALTER STEMMONS, CONNECTICUT

THIS is the story of a cow—"Lady Sylvia of Barnstable" 21156. She wasn't a phenomenal cow so far as milk production goes, averaging about 5,000 lbs. of milk, year after year, but in thirteen years she left her mark on the dairy industry of Tolland County, Connecticut.

The farm of John T. McKnight lies in the famous Connecticut Valley tobacco district. There are 100 acres of tillable land on the McKnight farm, smooth and with hardly a stone. It is as good tobacco land as can be found in the Valley. And yet there isn't an acre of tobacco grown on the McKnight farm. Perhaps to the average reader this statement will not mean much, but to one familiar with farming operations in the tobacco district it requires an explanation. The explanation goes back to "Lady Sylvia Barnstable". To her owner, John T. McKnight, she demonstrated that there is a lot more fun, and perhaps about as much profit, in a pure-bred Guernsey herd than in a tobacco farm.

"Lady Sylvia Barnstable" has gone to her reward. She was born at Concord, N. H., in 1906, and as a calf came to Barnstable on Cape Cod. At the age of 4½ years she came to Mr. McKnight's Oaklawn Farm in January, 1911. She was then with calf for the third time. This calf, later registered as "Lady Jane Sylvia" 36528, shares with her mother the honor of building up the present excellent Guernsey herd at Oaklawn Farm.

When "Lady Sylvia" dropped out in January, 1924, she had a record of sixty-five descendants born at Oaklawn Farm. The list included thirty-nine heifers and twenty-six bulls. In the thirteen years she remained at Oaklawn Farm, she directly accounted for thirteen of the sixty-five descendants. Twelve of these calves were dropped in May and one in June. Regularity was a passion with "Lady Sylvia". Even her milk production and her fat tests varied little from year to year. She was never sick, never lost a feed, and never had udder trouble.

"Lady Sylvia" is the only pure-bred female that Mr. McKnight has ever bought. He paid $150 for her in 1911. He has owned only pure-bred Guernsey bulls since 1911 and by buying a better bull each time has endeavored to build up the production of his herd. The daughters of "Lady Sylvia" have beaten her in milk production but not on fat tests. Even there, however, she has left her mark on the herd, for the average fat test for the herd runs 5.5 per cent.

There are now twelve milking cows in the herd. Two of them are the surviving remnants of the grade Jersey herd that Mr. McKnight owned at the time he bought "Lady Sylvia" and the first Guernsey bull and started to build a Guernsey herd. These two grades represent, of course, the best of the original grade herd. They stand alongside the pure-breds and there is little to choose from except that, of course, they do not show the close family characteristics of the "Lady Sylvia" line. Merely by using pure-bred bulls on his original grade cows, Mr. McKnight could have built up a grade herd almost as good in production as his present pure-bred cows. However, he preferred pure-breds and his original investment of $150 in "Lady Sylvia of Barnstable" is the only extra cost of the pure-bred herd. Where is the man who "can't afford a pure-bred herd"?

Mr. McKnight now has a fine string of heifers coming on. All replacements will be from the Lady Sylvia line. Every heifer calf that shows promise is kept in the herd until she has had a chance to prove her ability. With her first calf she is expected to produce at least 6,000 lbs. of milk. If she cannot do that there must be a very strong excuse or Oaklawn Farm sees her no more. At present there is no cow in the herd more than four years old. Mr. McKnight has faith that his heifers will keep up production. In fact, any heifer that doesn't show more promise than her dam is a disappointment.

This system of herd management has required that each bull be replaced by a better animal. That wasn't so difficult when the basis of production was 5,000 lbs. for a mature cow, but with 6,000 lbs. demanded of a heifer with her first calf it has come to be more of a problem. The present bull, "Langwater Governor of Carteret", was sired by the famous "Langwater Warrior" from an imported cow and was purchased as a calf at the big Langwater Sale in 1922. It was one of those happy purchases sometimes made at big auction sales when the weird turn of crowd psychology enables the shrewd buyer to gain possession of an animal which ordinarily would be out of reach of his pocketbook. Although now only a two-year-old, the bull shows great promise. Growing out young stock is an especial hobby with Mr. McKnight and under his care the bull is developing into an outstanding animal.

LADY SYLVIA OF BARNSTABLE

This cow has a record of 65 descendants born on Oaklawn Farm, owned by John T. McKnight. The list includes 39 heifers and 26 bulls, all born within the past 13 years. She, herself, is the mother of 13 of these, her daughters and granddaughters accounting for the rest. This is a rather unusual record of building a herd on one cow.

CAREFUL ATTENTION IS GIVEN TO CURING CLOVER HAY AT OAKLAWN FARM

For two years the herd has been accredited as free of tuberculosis. There has never been a reactor in the herd, perhaps largely due to the fact that he has bred from a healthy foundation and in thirteen years has brought no females into the herd from the outside.

Guernsey cream, Guernsey cows, and hay are the principal products sold from the farm. Some vegetables are grown commercially, especially peas and cabbage, but dairying is the main industry despite the evident temptation to tobacco growing and market gardening which the smooth Connecticut Valley offers. For over twenty-five years Mr. McKnight has been growing alfalfa hay, although never with perfect success, chiefly because fields are too level to permit proper surface drainage in early spring. He does get excellent results with clover. There is a market for all the hay the cows do not require.

In summing up the returns which "Lady Sylvia of Barnstable" has made on that original investment of $150, we might mention some of the following: Thirteen years of steady milk production of remarkably high fat test, and a healthy calf every year; the sale of eleven females; the distribution of several good pure bred bull calves as sires for other herds; a growing demand for surplus cows from the herd; and, finally, an entire herd of twenty-two pure-bred Guernsey cows and heifers free from tuberculosis or abortion.

Perhaps the question is not so much: "Can I afford to own a pure bred herd" as it is "Can I afford not to"?

Why Illinois Dairyman Should Believe in T. B. Test

B. H. OLDS, OHIO

I WISH to reply to the article under the heading "Dozen Reasons Against T. B. Testing". I don't blame you, Mr. Illinois Dairyman, from being ashamed to sign your name to your article! I am addressing the gentleman who has been so terribly misinformed in regards to tuberculosis eradication work, the man who is the owner of around fifty head of high grade Holsteins, so high that they are valued at $200 each, and according to his article they are nearly all infected with tuberculosis.

No doubt the subject of "Tuberculosis Eradication" has been of great interest to you, but I believe you have obtained your information on the subject from the wrong source. Please do not misinform your friends if you like them.

I am a farmer and have some cows and, best of all, I have some friends who have cows. Surely, my salary would not be stopped if tuberculosis eradication work should stop. However, I would hate to think of living in a country allowing such a condition to come to pass.

In answer to each of the dozen reasons which you gave against tuberculin testing I will say:

1. That scientists will disagree on any subject just as long as there are scientists, with all due respect to them. Even though we take it for granted that bovine tuberculosis is not transmissible to man, how many of you readers want your children to drink milk from cows known to be affected with tuberculosis? I dare say that there is not one, including Mr. Illinois Dairyman himself, if he is lucky enough to have any.

2. The three tuberculin tests which are used to diagnose bovine tuberculosis, namely, the subcutaneous, intradermal, and ophthalmic tests, are considered to be extremely reliable and accurate the world over, when they are properly applied. When they are applied dishonestly or otherwise, please call them something else besides tuberculin tests.

3. It is true that a comparatively small per cent of reactors show tuberculous lesions in the udder. However, since it is impossible for us to tell where these lesions are located and what stage of development they are in, without holding autopsy, I can see the advisability to condemn all reactors in order to be sure and eliminate the spreaders of the disease.

4. I dare say that the statement which you refer to, as being false or misleading made to cattle owners in order to induce them to submit their herds, are made by misinformed persons and not by the schemers and political grafters which you referre to, whose enormous salaries depend so largely upon tuberculosis eradication work. I have conversed with many of those fellows and they have failed, so far, to make me any false or misleading statements.

5. Mr. Illinois Dairyman, if you should sign the contract and submit your high valued, grade herd of tubercular cattle to the tests, I will assure you that if that contract is one which is co-operating with your state and federal governments, you will

(Continued on page 180)

DOWN IN GEORGIA

J. H. REED, GEORGIA

A ROAD SIGN THAT SPEAKS FOR ITSELF

WITHIN the next three years, Georgia will be the "Wisconsin of the South". Not only will she be supplying herself with cream, butter, cheese, and poultry products, but she will be supplying Florida's growing tourist trade and the fast-opening markets of Cuba, Central and South America as well.

I make that statement conservatively, from a knowledge of Georgia's performance during the past three years and from a study of Georgia's economic advantages for production and transportation to market.

Three years ago there were just three creameries in Georgia, and they made approximately 7,000 pounds of butter that first year and had a difficult time securing cream enough to make that much. Last year, however, there were nineteen creameries in the state, producing more than 2,000,000 pounds butter.

Three-fourths of this production have been in one county—Turner County. And there are 160 counties in Georgia as well fitted for dairy production as Turner County.

Just the other day the People's Bank of Tignall—one of the smallest banks in the entire state—set aside a fund of $10,000 in order that it might secure its share of the $5,000,000 federal aid fund for the purchase of live stock from the new Intermediate Credit Bank at Columbus, S. C.

This gives the People's Bank of Tignall a fund of $110,000 to loan out to farmers wishing to purchase dairy cows. It will enable farmers to secure at least 1,000 first-class dairy cows in Wilkes County.

What's to prevent creamery butter production from making another 5,000 per cent gain in the next three years? What's to prevent it from pyramiding at even a greater rate of increase?

Nothing—as I have said—except the lack of a suitable market.

Take the local market, first. There are approximately 3,000,000 people in Georgia according to government census statistics. Figures compiled by the United States Department of Agriculture say that the per capita consumption of butter is 16 pounds per year.

Three million times sixteen gives us 48,000,000 pounds of butter consumed annually in the state of Georgia—let's call it 50,000,000 pounds to make it a round figure.

Figures from the Department of Agriculture show that the farm production of butter in Georgia is 30,000,000 pounds. That leaves a demand for 20,000,000 pounds of creamery butter that must be supplied from other sources than the farm. The local creameries produce about 2,000,000 pounds of this demand—about one-tenth. The rest—18,000,000 pounds—is shipped in from New York, Wisconsin, Iowa, and other great dairy states. Not much question of demand for the next year or two, is there?

And when you consider the Georgia dairyman has cheaper land, cheaper buildings, cheaper labor, cheaper feed, less tuberculosis to contend with, and a longer season for pasturage—with butterfat bringing the same prices as that on the Milwaukee and Chicago markets—you can readily see that the Georgia dairyman is going to take advantage of the economic situation. He is going to run foreign butter right off the Georgia market with its own product.

Even granted that the Georgia market was filled in a year or two—there is still a gap of some 17,000,000 pounds to be filled. Georgia enterprise will find where these markets are in short order when the need arises—and Wisconsin is apt to find Georgia a keen competitor, not only as regards quantity and prices, but as regards quality as well.

Now we come to our foreign markets and that's a point I want to impress upon dairymen everywhere. Do you known where that 6,000,000 pounds of butter we exported last year went?

If you don't know, you'd never guess.

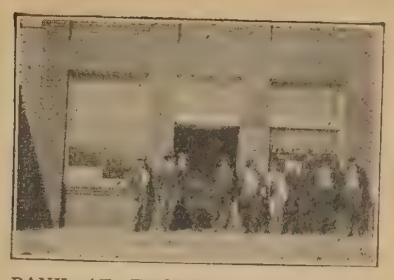
Four-fifths of it went to Cuba, Central America, and South America. Cuba, the largest importer of butter from us, took, last year, 1,500,000 pounds.

Last year we exported 30,000,000 dozen eggs to these countries. Cuba took 12,000,000 dozen. The same sort of a market exists for poultry and meats of all kinds.

When the Georgia demand has been satisfied—when the demand at home has been filled—Georgia can turn to the Central and South American markets and dispose of all the creamery butter and cheese she can manufacture. And what's more—she can do it more cheaply than can New York or Wisconsin because of her proximity to the markets and her advantageous freight and water rates.

With the proper storage facilities in Savannah the Georgia creamery can get its products to Cuba, to the West Indies, to South America much more cheaply than the northern creamery.

In a few years Georgia will go out after the South American trade. And make no mistake—she will capture it. She can produce more cheaply than any other section. She has better lines of communication—shorter lines of communication—with her South American markets than any other section. She has cheaper freight and ocean rates.



And she has something else that other southern states don't seem to have acquired yet—the will to do. When she needs something, her business men go out and get it for her.

Even now, preliminaries are under way for a farm products warehouse in Savannah—a warehouse where butter and cheese, eggs and poultry can be held and fed out to the Central and South American trade. If these plans go through it will put Savannah on the map as one of the country's leading ports of shipment for farm products.

Much of this progress has been due to the Georgia Association—a non-profit organization supported by the farmers and business men of the state with headquarters at Atlanta—which has brought national attention to Georgia by sponsoring the cow—sow—hen program and which, through that program, has changed the credit system of the state.

HISTORIC MIDWAY CHURCH IN LIBERTY COUNTY, GEORGIA
Two of the signers of the Declaration of Independence were members of the congregation of this church.

BANK AT TIGNALL, GEORGIA, FINANCES PURCHASE OF COWS

The Georgia Association has worked out a long-term farm loan purchase plan, built up on the dairy cow, which is offering a boon to the live stock farmers of the North and West almost equal to the old "free land" days on the public domain. As a result, not only are Georgia farmers learning how to handle dairy cows, but many dairymen are coming in from other sections of the country.

The day when Georgia was a market for butter and cheese is fast drawing to a close. In another year or so she will be an exporter of dairy products—not an importer. But in the next five years Georgia is going to be *the best market in the United States for pure-bred stock.* So it's an ill wind which blows nobody good.

If the northern dairymen will rise to the present opportunity and press the sale of good stock instead of bewailing the loss of a good butter and cheese market, they will make more money from the section in the next 5 years than they have in the past 10.

Everywhere banks are lending money to farmers for the purchase of dairy cows. Everywhere the farmers are turning to the dairy cow as a basis for intelligent farming. Everywhere creameries and cheese factories are springing up to give a profit to their owners and to the neighboring farmers alike.

Georgia is on her way to be the "Wisconsin of the South".

Another Good Idaho Record

One of the best records in Idaho dairy history has been reported by Secretary M. H. Gardner of the Holstein-Friesian Association of America. This record is that of Sarcastic Mercedes Lassie. "Lassie" started test on January 20, 1923, at the age of 7 years, 8 months, and 12 days. In 365 days she produced 22,439.5 lbs. milk containing 845.76 lbs. fat which is equivalent to 1,057.2 lbs. 80% butter. "Lassie" was placed on official seven-day test six weeks after freshening at which time she is credited with 612.8 lbs. milk and 23.524 lbs. fat which is equivalent to 29.4 lbs. 80% butter, or over 4 lbs. butter per day.

"Lassie" was bred by the Hendershot Land and Live Stock Company of Idaho and is now owned by Mr. E. G. Ehlers.

Hungarian Vetch in Oregon

E. R. JACKMAN, OREGON

OVER the western horizon a new forage crop has appeared, Hungarian vetch. The average person in the Middle West is apt to think of vetch in the same way as he sings of bananas "—yes, we have none." But along the coast in the Pacific Northwest, vetch has a real place and is grown by the thousands of acres. In entire counties it is one of the principal forage crops and is used for hay, silage, and is often threshed for seed.

Hungarian vetch was first grown at the Oregon Experiment Station in 1908. Harry Schoth, in charge of the forage crop work there, gathered together all of the vetches of commercial importance in the world. After several years of trials the Hungarian emerged from among about 400 others and claimed attention.

Mr. Schoth says of this new vetch, "Hungarian has two big advantages over the common—it is almost aphis proof and it will grow on some land which is too wet in the winter for the ordinary variety. A man, on some of the poorly drained land, can plant this and it will survive through the wet winters. It is a little more winter hardy than the common, too."

In the fall of 1922 the county agents of 11 Western Oregon counties secured seed of the new vetch and tried it out on from 1 to 25 farms in each county. I had a chance to see a good many of these fields last summer and to talk with the growers.

It must be understood that in the Willamette Valley of Oregon the winters are mild and grass is green the winter through. Most of the vetch area is ordinary spring vetch fall planted, rather than the hairy vetch which is more winter resistant.

Howard Wagner of Corvallis was one of the first to try the new vetch. He says: "Hungarian will grow on some land too wet for the common, but people musn't get the idea that they can plant it in a swamp and have it grow. The land where it will do well and common won't, because of wetness, is probably limited to a few counties, but there are thousands and thousands of acres of land around this country that are just a little too wet for common—just wet enough in the winter so that the common will live some winters and won't in others. On those acres the Hungarian will grow."

"The aphis-resistant feature appeals to me," said Mark Lafky of Junction City, "I have had my common vetch cleaned out by aphis a time or two but they don't like this new variety. I regard it as a kind of crop insurance. I seed it back on the same land for 2 or 3 years without plowing and so get rid of a lot of expense and the crops get better every year."

Trials are extensive in Washington County in the northern end of the Willamette Valley. O. T. McWhorter, county agent, says, "Hungarian has not demonstrated its superiority over common to any great extent in our county except as a seed crop. It will unquestionably produce more seed than the other, at least 25% more, and this is important for a lot of our folks are growing seed. On the good, well drained land such as most of ours is, the common will perhaps make more forage except in the occasional aphis year."

Coming further south in the Willamette Valley I saw A. C. Heyman who, as a county agent, tried it out thoroughly in Linn County. This county has thousands of acres of flat land which will not grow common vetch due to its inability to come through the wet season on this type of land. Mr. Heyman says, "I examined last spring every field of Hungarian vetch in this county and I am sold on it 100%. It will make a good legume hay crop on a lot of dairy farms here which lack such a crop now."

VETCH FIELD IN THE WILLAMETTE VALLEY

It is being tried out in several counties as a cover crop to plow under and to enrich the soil in orchards and berry patches. It has proved to be particularly well adapted to this purpose in Multnomah and Jackson counties.

"Where in the United States will Hungarian vetch probably be grown?" I asked Professor Hyslop, head of the Farm Crops Department at the Oregon Agricultural College.

"In the first place, on probably 100,000 acres of Western Washington and Oregon land which is just a little too wet for common. Then as a cover crop on several thousand more acres of our fruit and berry lands. Outside of this district its uses are yet to be demonstrated. It is probable that there is a place for it as a cover crop and green manure crop in the South Atlantic and Southern States, but that is yet to be demonstrated. We are mostly concerned with it as a crop which will stand a little more severe conditions than ordinary vetch and one which does not have the disagreeable volunteer habit of the hairy."

I next pursued the trail of the vetch to the dairy barn and asked R. C. Jones of the Dairy Department of the Oregon Agricultural College how the cows seemed to like it. It had developed that farmers, county agents, and experiment station men had a good word for it and if the cows also endorsed it, that clinched the matter so far as I was concerned.

Professor Jones reported—"The cows seem to like this vetch and take to it with more than ordinary relish. It has a theoretical feeding value as high as alfalfa, but I doubt if feeding tests would show it to be quite as good. We are planting quite a lot of it for our own dairy herd and can recommend it to Western Oregon dairy farmers."

The value of this new crop may be appreciated when it is realized that it is a legume hay crop with yields running from 2 to 4 tons per acre on ordinary land and that Western Oregon is short 240,000 tons of legume hay. It is one legume which will grow on acid soil. The introduction of this crop will cut down the feed bills of thousands of dairymen and will be a distinct asset in the building up of the dairy industry of Oregon.

An Arkansas Dairy Community

E. B. MATTHEW, ARKANSAS

AMID the gloom that seems to envelop many farmers, it is greatly refreshing to find a locality where a beam of sunlight has broken through the cloud of despondency. There is such a community in the Oakdale school district of Arkansas. This community is made up of small farm owners whose holdings range from 40 acres to 160 acres. Until three years ago the farmers here were like the farmers in thousands of other cotton-growing areas; they handled very little cash during the year before cotton-picking time, and then only to pass it on to their creditors at the close of the season. Cotton was their sole dependence. The land gradually produced less cotton, although more fertilizer was used. Then the boll weevil came. Last year on some farms it took 18 acres of cotton to make a bale.

Three years ago the Smith-Hughes agricultural teacher put on a program of diversified farming. He advocated dairying and poultry raising. Up to this time no cream had been shipped from this locality and the poultry consisted of a few mongrel flocks raised for family use only.

A recent survey of this community by the state supervisor revealed that ninety per cent of the farmers are now on a cash basis through dairying and poultry raising. Each farmer has from 5 to 12 cows and a small flock of poultry. The cream is shipped to a creamery twelve miles away. The investigator spent an entire day interviewing the farmers of this neighborhood and found them uniformly optimistic, hopeful, and contented. The dairy herds were small but showed intelligent management. There is a concerted community breeding program. Good sires are used on ordinary Arkansas grade cows, and the heifers are retained with a view to herd improvement.

THIS FLOCK OF 72 HENS PRODUCED 600 DOZEN EGGS IN 5 MONTHS. THEY BELONG TO C. F. LENDERMAN

A typical situation is that of Mr. J. J. Lenderman. He milks 9 cows, raises his own feed, and has an income from his cream shipments sufficient to support the family, thus leaving for profit his cotton, sweet potatoes, and other products. Mr. Lenderman has a herd of Jerseys that he is justly proud of. His herd sire has a splendid production record back of him. The heifers are retained and in time Mr. Lenderman expects to develop a herd that will be a credit to any community. Mr. Lenderman also has a Percheron horse project that is unusual in a cotton section.

Mr. C. F. Lenderman, while interested somewhat in dairying, specializes in poultry. He, like all the farmers visited, keeps records and can tell offhand just about what his flock and herd produce. Mr. Lenderman's records show that from 6 dozen hens he secured 600 dozen eggs from January 1 to June 1. The remarkable thing about this flock is that it was bred up from a mongrel flock of hens by using pure-bred cockerels. Here is demonstrated most conclusively the possibilities of breeding up a low-producing flock by the use of well selected males.

Every farmer visited during the day's inspection was found working in the field. The majority of them were cultivating or planting feed crops. Each of the farmers had his cotton, but little interest could be raised in a discussion over it. Lead up to the dairy and poultry business however, and enthusiasm was manifested at once. Mr. M. D. White has the largest dairy herd in the community. He milks 12 cows. When the investigators called at his place he was found breaking an oat stubble field preparatory to planting cow peas. Although very busy with his work, Mr. White unhitched his team and went with the party to a nearby pasture where his cows were grazing in lespedeza, a legume naturally adapted to this locality.

When asked how he got into the dairy business, Mr. White said: "I got into the dairy business somewhat by accident. All the other fellows were going in, so I found an opportunity to trade some mules for cows. This was in the fall of the year. I brought the cows home and then began to wonder what I would do with them. I was short of feed and for a time regretted my venture. We began to make butter and soon had everything in the house filled with it. I then realized that I needed a cream separator. This was purchased and the cream sold on the regular market. These cows paid for their feed that winter and left some profit besides. Now I am selling $50 worth of cream per month above feed

(Continued on page 181)

Value of a Good Cheesemaker

HOARD'S DAIRYMAN:—No one is in a better position to judge of the cheesemaker's value to his factory than the receiver of cheese in the large market. Daily he passes judgment on the product of many factories and unknowingly perhaps forms a mental estimate of the man who makes that product.

The general competence of the cheesemaker continues to be indicated as the cheese are examined, by their appearance and the manner in which the bandages and cloth circles are placed. There is much besides the mechanical process of preparing the cheese for marketing that is the work of the cheesemaker. However, it is safe to conclude that the cheesemaker that uses extreme care in that respect is equally careful in all that he does.

The responsibility of the cheesemaker is heavy as the success of the cheese factory, to a very great degree, hinges on the results which he obtains. Not only is it necessary that he make cheese of such quality and so prepare it that it can be marketed to advantage, but he must also be able to secure a desirable yield. No one will expect him to make a strictly fancy cheese from poor milk, but if he can make the best quality of cheese possible from the milk furnished him and at the same time control its composition so as to not render his factory liable to prosecution under existing laws governing the composition of cheese, the service which he renders his factory is invaluable.

Altogether too often the work of the cheesemaker is unappreciated. The average person is inclined to consider the making of cheese in the light of a mechanical process. He does not realize that modern cheese factory operation is the result of many years of thought and investigation on the part of highly trained scientists. The cheesemaker of today in order to be proficient in his line must not only of had years of practical experience but an intensive theoretical training as well. In addition he must be constantly on the alert to keep abreast of changing methods. Not infrequently an instance comes to light where the competent but comparatively high salaried cheesemaker is discharged through false economy on the part of the cheese factory board. Such instances are nearly always followed by disaster for the factory. The high salaried cheesemaker that produces results always proves the cheapest in the long run.

As an instance that proves the above I will mention my own case. Upon my return from overseas I was given charge of a factory that was $2,700 in debt. Through close application to my work and treating the farmers as I would like to be treated, I was able at annual meeting in February, 1920, to show the debt as being paid, $500 in the treasury, and patronage doubled. At this meeting nothing was said beyond showing me they were pleased, but they failed to give that which we all want—an increase in salary for work well done. A couple of months later I asked for a raise and was refused. Another factory made a good offer; I left. A few months later the board of this factory paid me a visit and offered me more than I was then receiving, reciting a list of grievances about what had happened after my leaving. As the patrons of the factory I was working at then, heard of this they came to me. Well, the result was that I did not return. What followed at the first factory makes me feel good today. More makers should make an attempt to teach their farmers a lesson. Every good man has had experiences of this kind.

The man who has no faith in himself never ought to take charge of a cheese factory, especially where the hardest job he has ahead of him is handling people. Handling an eighty-pound cheese or a ten-gallon can of milk is child's play compared with handling 25 or 50 horny fisted farmers that know what they want and when they want it.

Experts on factory management have always emphasized "tact" as the big essential in the successful operator's make-up, but it has to be backed up by a certain amount of "spunk" if he is going to get best results. I have never believed it necessary for a maker to surrender his manhood to any degree, and I believe the man who lowers himself in his own sight lowers himself in the sight of his patrons. Let him be a man, "fair, square, and liberal," and expect the same respect from his patrons as he expects to show them.

Illinois. C. R. BARKER.

Jenny Pietertje Ormsby Skylark is now Arizona's leading Holstein for production in one year as a junior two-year-old. Her record is 18,061.5 pounds milk and 611.45 pounds butterfat, equivalent to 764.3 pounds butter. She is owned by the Miller Cattle Company, Inc.—Extension Service Holstein-Friesian Ass'n. of America.

EDITORIAL COMMENT

WE must measure some things by other things in order to get the right idea of things in our minds.

CATTLEMEN'S CONFERENCE

A Dairy Cattlemen's Conference will be held at the National Dairy Show in Milwaukee, Wednesday, October 1. The subjects for discussion will be sales integrity and standards of sanitation in the shipment of cattle. Each year purchasers of dairy cattle are getting more particular about the health of the animals which they buy, as well as their capabilities. Stock yards and stock cars have not been kept as sanitary as they should and shippers in the future will demand more from the railroads, in regard to sanitary yards and cars, than they have in the past. Men informed upon the importance of good cows free from disease and the necessity of better methods of sanitation in shipment, will participate in the program. We urge all breeders of dairy cattle to attend this meeting for it is desirable that there should be outlined a sound system of selling and shipping cattle.

SILO OWNERS SMILE

Corn is jumping up and up in price as the promises of a good crop become more and more discouraging. In some sections it has been hit by drought, in other sections by poor germination, and in the great corn belt states by incessant rain and cold weather. In fact, crop reports indicate one of the poorest corn years in history.

All of us would like ear corn to sell or to feed during the high price season, but the dairyman with a silo can still smile with satisfaction. His yield may be reduced, but he has a place that will conserve all the feeding value there is in the plant and he has animals that will turn this otherwise waste product into money.

It is said that the packer conserves all but the squeal of the hog. The silo, in like manner, affords an excellent method of preserving the mature corn crop or saving one which for any reason must be harvested before maturity. About 40 per cent of the total feed value of the corn plant is in the stalks and leaves. When only the ears are harvested, the farmer loses nearly half the value of the plant. When drought, frost, or insects attack a field of corn before it is ripe, the entire crop is lost unless the farmer has a silo to preserve it.

Out in Colorado, as in other states, drought and late planting have made much of the corn crop of small value for grain. In Wisconsin, Illinois, and other states cold weather and excessive rains promise a like condition. The immature corn crop will drive home the value of the silo more emphatically than all the arguments that human voice and pen can gather together.

Yes, the dairyman with a silo is sitting pretty when it comes time to harvest an immature corn crop. Eighty per cent of the cow testing association members in Wisconsin own silos, enough of these having two or more silos that if equally divided would supply every member with a silo. Despite the continuous August rains that make grain harvest and haying well nigh impossible and the lack of hot weather to make good ear corn, there is satisfaction in knowing that the cows will have plenty of silage and hay for winter feeding. For these men the silo will build a profit out of a crop that otherwise would be largely wasted.

ABOUT T. B. TESTING

The article, entitled "A Dozen Reasons Against T. B. Testing", published in our August 8th issue, has brought us a number of interesting letters. Most of them give several reasons why this Illinois dairyman is in the wrong, but two or three have commended him for his courage. One communication cites several disappointing experiences in tuberculin testing, but since the writer does not care to have his name appear we will not publish his article but will give one experience related.

He said one young man bought ten cows from federal accredited herds and upon testing them four months afterwards found seven reactors. We may say in answer to this that invariably when such cases have been thoroughly investigated, it has been found something was done that permitted the animals to become infected. We are inclined to believe that if a thorough investigation were made, a nigger in the wood-pile would be found somewhere. These cows, in other words, were either improperly tested or were exposed to tubercular animals. This subscriber then cites the charges some veterinarians have made and which are excessive.

We hold no brief for veterinarians who overcharge for their work. Such men can be found among veterinarians, the same as among other doctors or other professional men. This is no argument against the tuberculin test. It is simply a citation of a veterinarian who overcharged for his services and should not be used in an argument against cleaning up a disease which costs the dairy farmers millions of dollars annually. The thing to do is to get rid of such veterinarians as well as reacting cows.

LOAFING OR FUN CHILDREN

Our state legislatures at their next sessions will be asked to vote for an amendment to the United States constitution giving Congress the power to prohibit the labor of persons under eighteen years of age. We object to this amendment for at least two reasons. First, we do not believe Congress should be granted the power to determine at what age our children have the right to work. Second, we consider it a positive detriment to prevent any young persons from doing work before they are eighteen years of age.

We believe there is some necessity for regulating child labor. It is against our sense of justice to force any youngster into hard work that will prevent proper physical development and an opportunity to secure a good education. We believe, however, that such matters belong to the state and that no law should be enacted which would prevent a boy or girl from working until eighteen years of age. It would be more harmful than beneficial.

The Ohio State Grange is against this amendment and for the following reasons:

"Because it would give to Congress the power to prohibit or regulate essential and health promoting labor on farms of children under eighteen years of age.

"Because it would permit an invasion of the home, the local community, and the state by the national government.

"Because it would entail great and additional expense, ever increasing, entirely unwarranted.

"Because it would set up a force of national enforcement officers, duplicating those already in the states.

"Because it would be another step toward a paternalistic, centralized government, and we have already gone too far in this direction.

"Because involuntary idleness by law would be a step toward the demoralization of society and the destruction of the government our fathers founded."

Work is the key to happiness. Men and women of the world who are engaged in useful activities are the ones who are having the good time and not the loafers or spenders of money. Where can happier boys and girls be found than those engaged in club work of some kind? Some of them right now are preparing their calves, pigs, or chickens for the fairs or are exhibiting them. The greatest fun in club work comes in the years between 10 and 18. Such work not only affords them a good time, but it teaches them to like work and how to work.

Can any man, enriched by years of experience, find anything in his whole life that has brought him more pleasure and genuine satisfaction than the years he spent on the farm doing some regular job assigned to him by his father or mother?

FACTORS INFLUENCE PRICES

Reports from the U. S. Department of Agriculture show that there is a decided reduction of wheat in nearly all countries of the world. The corn crop in this country promises to be much less than last year and the hog crop is also smaller. We are not wise enough to know all the details concerning factors influencing the market prices of various products but we do know that whenever there is a slight overproduction of any farm commodity, the price is materially lowered and that when there is an underproduction the price materially advances. In other words, it takes but a small quantity of a product, one way or the other, to cause prices to rise or fall. The market seems to be a very sensitive institution. It is generally agreed that the average low price of wheat, hogs, and corn for the past few years has been directly attributed to overproduction. Now there is a much smaller production of these products and there is nothing unusual to have the prices of these products advance. Take cotton, for instance. The price advanced very rapidly when the boll weevil claimed about 50% of last year's crop.

Prices of dairy products the past few years have been relatively higher than the prices of most agricultural products and this has stimulated a decided increase in the production of milk. The result is that the prices of dairy products, so far in 1924, have been lower than in 1923. It seems to us it is wise to consider that overproduction is the greatest factor in depressing the prices of farm products rather than to complain and be constantly on the lookout for some combination which manipulates the markets. It has been our opinion —and it still is—that we are operating too much unprofitable land and keeping too many scrub cows. Both scrub acres and scrub cows are producing a sufficient surplus to depress prices and one way, at least, to improve prices is to quit milking unprofitable cows and quit raising crops on poor lands.

CONTRACTS LEGAL

The circuit court of Frederick County, Maryland, in a recent legal decision, upheld the validity of co-operative marketing contracts. The suit was instituted by the Maryland and Virginia Milk Producers' Association against S. I. Linton, one of its members, who had broken his contract, and against W. A. Simpson, wholesale milk dealer in Washington, who encouraged Mr. Linton to sell his milk to him. The decision of the court forces Mr. Linton to deliver his milk to the Maryland and Virginia Milk Producers' Association and has ordered the dealer, Mr. Simpson, to stop buying his milk and requires him to pay all the costs of the suit. In handing down the decision, the court, in part, said:

"The purpose of the association is to secure better results in marketing. In order that such an organization may accomplish the purpose for which it was formed, it must be able to depend with reasonable certainty upon the fulfillment by its members of their mutual obligations. Unless the members fulfill the contract, the association would be in constant danger of disintegration and failure. Binding contracts are clearly essential to its existence and success."

This is not the first time courts have been called upon to pass upon the legality of contracts made between a member and his association. In building a co-operative marketing company, we look upon the contract as being essential for it is necessary to know how many members can be depended upon to support it. If there are no contracts, but simply a verbal agreement, the management is not in position to guarantee a definite supply of milk to wholesale milk dealers. No milk producer should sign a contract unless he has made up his mind to fulfill it, we care not whether the contract be good or bad. He is under obligation to do the things the contract requires. No co-operative marketing association can hope to succeed unless its members will stay by it in times of adversity as well as in times of success.

Chloride of Lime

How is chloride of lime used in making the solution for sterilizing milking machines?
Mississippi. D. U.

Dissolve the contents of a 12-ounce can of chloride of lime in a gallon of water. Strain this solution into a crock or glass jar, discarding the sediment. Cover and keep in a cool, dark place. This is known as the stock solution and it will keep a long time under these conditions.

Be sure that the chloride of lime is in a clean and fresh looking container. If the contents look old and caked, the material is worthless. In preparing the solution, first add just enough water to the chloride of lime to make a paste. Stir well and add the balance of the gallon of water.

To make the solution in which the milking machine utensils are soaked, use a quart of the stock solution to every 20 gallons of salt water. Add 1 pint weekly of the stock solution in winter and 2 pints weekly in summer. Make up an entirely new stock solution once every eight or ten weeks, or whenever the old solution ceases to be clean and sweet.

There are several sterilizing solutions on the market that are excellent for this purpose and have the advantage of being always of standard quality.

Seeding Alfalfa in Corn

I tried a small patch of alfalfa by sowing the first of last August. The stand is not satisfactory and wish to try it on a larger scale. Recently while out in the country I saw a fine field of alfalfa and was told that last season (the sixth year) he got 22 large loads from the five-acre field. I asked him the best way to start it, and he said he had the best luck by plowing his corn the last time with a small shovel single cultivator, which leveled the ground nicely and then sowed his alfalfa in the corn. I have never heard of alfalfa started this way but have often been told that it was a wonderful success in getting a stand of red and alsike clover. What do you think of this method?
Wooster, Ohio. A. C. K.

Some time ago we received from one of our Wisconsin readers the following information concerning his method of seeding alfalfa in corn:

"We have seeded alfalfa for the third time in our corn. We do not recommend this as the best method, but we cannot seed in grain nor can we afford to miss a crop. The corn should be well worked early and kept clean. Cultivate the last time with a harrow-tooth cultivator and seed with a wheelbarrow seeder. Do not stir the ground after sowing or some seed will be covered too deep. The corn is cut off for silage and the corn stubbs are harrowed down when the ground is frozen."

This gives the usual system of seeding alfalfa in corn and some men have reported very excellent results. Unless a special form of drill is used, there may be some difficulty in properly distributing seed, especially if the last cultivation comes when the corn has reached a fairly good growth. If this corn is to be cut and shocked, care must be exercised to get the corn shocks off the field with very little delay, otherwise they will kill out the growing alfalfa. The better system is to seed alfalfa in corn which is to be used for silage.

Kill Morning Glories in Corn Field

I was interested in your article on weeds as I have a field of corn badly infested with morning glories. Would the carbon bisulphide treatment or sodium arsenate spray hurt the corn now?
Newport, N. Y. J. M.

It would be unwise to use carbon bisulphide for the destruction of morning glories in a corn field. The corn and morning glory roots are more or less intermeshed. The destruction of the roots of one would have the same effect on the other. The use of this destroying agent is practical on a field after the crop has been removed or where no crop is being produced.

Success in the destruction of weeds by the use of chemical sprays depends upon getting the spraying solution into direct contact with practically all portions of the plants to which it is being applied.

The most effective method is to apply the solution with a pressure sprayer equipped with the right type of nozzle. The nozzle must be so constructed as to deliver a fine misty spray which will settle over all parts of the plants like a dew or fog. Obviously it would be impossible to so spray morning glories in a corn field without doing serious injury to the corn. The corn is more resistant to the action of the sodium arsenate, sodium arsenite, and other chemical sprays than the morning glory, due to the finer texture and smoother surface of the leaves but would quickly show ill effects of the spraying.

In addition it must be remembered that sodium arsenate is a deadly poison. It destroys but is incorporated with the plant tissues upon which it is sprayed. Corn sprayed with it could not be used for live stock feeding, hence the use of this spray in corn or other crop fields would be extremely dangerous.

If corn and morning glories are well along in their growth the best that can be done this season is to cultivate as intensively as possible. If available a knife shovel cultivator is a good tool to cut off the weed tops preventing leaf growth and weakening the roots. If the labor is available, hand hoeing around the hills will keep them down this year. What shall be done next year is too long a story for this article.

Variation in Test

HOARD'S DAIRYMAN:—In answer to the inquiry of G. W. H. in the August 8 issue on "Variation of Tests", I might relate some personal experiences I have gone through while on cow testing association and Advanced Registry work.

Many milk producers are still unable to understand why tests should vary with the "same feed, same cows, same milkers, same conditions throughout".

Specialists who have given years of their time in an attempt to solve these problems, agree that the cow truly has strange ways and the more effort put forth to ferret out these facts, the deeper and more antagonizing the subject becomes. As Professor Haecker puts it, "The cow does, she doesn't, then she does neither."

First, it must be recognized that the cow is performing a work that cannot be duplicated by the genius of man. Stop a moment and consider the feed fed the cow; then look at the finished product, manufactured in from 6 to 12 hours into a liquid composed of water, sugar, albumin, casein, fat, all in their proper proportions ready to be consumed for body maintenance. It must be remembered this change does not take place by some mechanical device but is stimulated by a nervous system; unless all conditions are favorable, a reaction will occur and the fat is first to be affected.

Sharp changes of weather, wind, lack of fresh air, uncomfortable quarters, the cow not loving her milkers, fever, harsh talk, all have their influence on fat production.

Any farmer knows it to be impossible for him or his horses to do the same amount of work each day where weather conditions fluctuate or if he does not feel just right physically. The same condition is true of a cow. It is her work to produce milk. The more milk she produces the harder she works and the greater the fluctuation will be. It is estimated that as much energy is required to produce 44 lbs. of milk as is required to plow an acre of loam soil, yet we think nothing of a 44-lb. producer. It seems to be a fact that it is easier for a cow to produce milk in the Northwest than it is in the South, so the weather conditions play a very important part in milk production.

The following 7-day official record was made near Columbus, Ohio, on a cow soon after freshening:

Time finished milking	Lbs. milk	% Fat	Lbs. fat
12:26 p. m.	16.9	6.55	1.1069
6:50	17.3	5.65	.9774
12:25 a. m.	15.8	6.55	1.0349
6:35	15.7	5.1	.8007
12:37 p. m.	16.4	7.05	1.1562
6:35	14.6	5.8	.8468
12:32 a. m.	15.8	6.3	.9954
6:30	13.4	5.15	.6901
12:30 p. m.	16.4	6.0	.9840
6:30	16.0	5.3	.8480
12:32 a. m.	14.8	4.6	.6808
6:32	15.1	4.9	.7791
12:41 p. m.	17.5	7.3	1.2775
6:35	15.4	5.8	.8932
12:30 a. m.	14.7	5.3	.7791
6:25	15.0	4.35	.6525
12:40 p. m.	17.7	4.6	.8142
6:43	18.4	5.3	.9752
12:37 a. m.	18.4	5.8	1.0672
6:27	15.1	4.4	.6644
12:37 p. m.	17.9	5.9	1.0561
6:50	17.9	5.1	.9121
12:35 a. m.	17.5	5.95	1.0412
6:25	16.0	4.8	.7680
12:26 p. m.	16.9	4.6	.7774
6:34	19.8	5.0	.9900
12:39 a. m.	18.0	5.65	1.0170
6:32	15.0	3.5	.5250
Total	460.1	5.45	25.1139

Notice the time of milking, the sharp fluctuation in tests in the 6-hour intervals, the greatest being 24 points. It also shows that where the percentage of fat raises that production also raised in the case of a few milkings, so it cannot be said that, as a rule, where production decreases, fat increases. Such a rule does not hold good, generally speaking.

I wish also to call attention to the last milking where the percentage of fat dropped far below the average, yet the supply of milk was about the same comparing it with the corresponding milkings. This drop was traced to a neighbor, wearing a red sweater, thoughtlessly entering the stable while the cow was being milked. She immediately stopped her eating and became somewhat nervous. The result was shown, not in pounds, but in fat percentage. She was tested the next two milkings, which were back to normal. The question is, what became of the fat she lost in that one milking? Nobody knows any more than can be explained why a black cow will eat green grass, give white milk, and make yellow butter.

I do not agree with the statement made by a tester in one of your issues, that 90 per cent of the fluctuation in fat tests is the fault of the farmer, but would rather say that 90 per cent of test variations are unavoidable as far as human power is concerned.

At present I am employed as a tester for a milk producers' milk marketing association and unless one is personally in that field the tester's problems cannot be appreciated.

There are still a few farmers who are more or less careless in taking milk from cans for home consumption. Where the bulk is sold to milk plants, usually the housewife waits until the hauler is about due to get her supply, when the milk is cool and the cream raised.

I have, in my possession, two small dippers taken from patrons' milk upon arrival at the milk plant. In most cases the good housewife does not realize what mischief these small instruments will do even though she may stir the milk as best she can; it is not sufficient to even disturb the SKIM in the bottom of the can. The milk producer has a right to as much milk as he wishes for home use, but the law of economics prohibits keeping it at home and selling it at the same time. During the period in which one of these dippers was found the test dropped nearly one per cent and the patron wondered why—so would we, had we not had the evidence.

Another peculiar thing happened. A producer wished to know if his milk was tested properly. He skimmed part of his cream out and sold it elsewhere. For that period the composite test naturally dropped and was observed by the dealer. Not knowing the cause, a fresh sample was taken from milk and was found to test very closely with the previous tests. It was given the producer, the composite sample being discarded entirely. Hence the farmer said it makes no difference to skim.

It is not always the fault of the producer. Some cases have been known where the tester became careless and did not test at all. He just referred to previous tests and perhaps varied it a point or two. He became too bold at this, was found out, and fired. Also a hauler was known to have a ten-gallon can of milk for sale and never owned a cow at the time. All this did not happen in one vicinity.

Most farmers are very fair and are willing to be shown and then will be satisfied. Several cases I have had under my supervision, the producer questioned the sampling. I loaned each of these men a McKay milk sampler and instructed them how to use them properly. For several weeks a check was made, unknown to the dealer and in one case unknown to me the sample was split, part given to me and part sent to the the state university. The results were the same all through. The farmer had a more friendly feeling toward those who were entrusted to handle his product.

One producer kept his evening and morning composite in a separate container to note the fluctuation if any. The evening milk showed 4.5 per cent and the morning 4.0 per cent. The composite held by the dealer was 4.25 per cent which is a closer check than could ordinarily be expected.

Those who are in cow testing association work cannot expect their one day a month test to check with a sample taken every day; in the course of a year or two it may not vary much, but that usually is not considered. I find more mistakes are made through testing a composite than from the sampling, due to the fact that the sample must be heated to the proper temperature to dissolve the cream but not as warm as to separate the fat from the solids.

Oct. 21-23—Wisconsin Buttermakers' Asso. meets at Chippewa Falls, Wis.

Nov. 1-8—Pacific International Live Stock Exposition. Portland, Ore.

Nov. 12-13—National Co-operative Milk Producers' Federation meets at Detroit, Mich. Secretary, C. W. Holman.

The 300-Pound Honor Roll

You need not visit long with the dominant man in any manufacturing or merchandising company before you discover that "volume" stands in his mind at the head of the list of the factors on which the profit of his business depends.

I often wonder if the cow owner appreciates the part which "volume" from each cow plays in his profits. It takes over 2,000 pounds of digestible nutrients or over 2,000 units of net energy to maintain an ordinary cow in health for a year whether she produces any milk or a calf or neither. Whatever this feed costs, it must first be paid before the cow can earn a profit over and above her keep.

The National Dairy Association believes the most important factor in increasing the profitableness of the milk cow is to measure each cow's yearly production, and the Cow Test Association is the cheapest, surest way to do it. Second, it believes that every Cow Test Association member who has developed a herd averaging 300 pounds of fat per cow per year has taken the biggest step toward increased prosperity. It believes this so firmly that it has invited the State Supervisors of Cow Test Association records in each state to send in the names of the men in their respective states, whose herds of five or more cows have averaged in Cow Test Associations 300 pounds of fat per cow per year or over. These men are receiving a personal invitation to be present at the National Dairy Exposition at 1:30 o'clock, Wednesday, October 1, 1924, at the Cattlemen's Conference, when, as a recognition of their success and as encouragement to them and others to strive for a profitable herd average, each will be presented with a diploma. This diploma may or may not mean much in itself, but the national recognition of successful effort and the attainment of a herd production which is practically an assurance of profit does mean much to the herd owners of America.

It is true some herds of ten to twenty cows are averaging over 400 pounds per cow per year and several seven or eight cow herds have averaged over 500 pounds each per cow; but the prosperity of the dairy industry does not depend on these exceptional herds. It depends on the great rank and file of moderate sized herds, each producing a moderate amount of fat per cow per year. A 300 pound average is a good mark for every herd owner to shoot at whether he has five cows or many. These cows bred to pure-bred sires are the foundation of prosperity year in and year out.

The National Dairy Association is happy to give this recognition to the herd owner, and indirectly to the cow tester, the extension worker of the cattle clubs, the states and the government. It is their tireless work that is bearing fruit.

H. E. VAN NORMAN.
Pres. National Dairy Association.

Buckeye Jersey Bull Sires Four Silver Medal Daughters

About four years ago Mr. Ray W. Elliott of Ohio decided that although he had his hands full working a 160-acre farm, he could not afford to be without good pure-bred dairy cattle. So it happened that he began to buy in a few registered Jerseys as the opportunity offered until in time six cows and one bull and a few heifers in calf were purchased. This foundation stock cost $2,650, but Mr. Elliott has already received $2,875 for breeding stock which he has sold, and still has twenty-five females, a herd sire, and two young bulls in his herd.

These Jerseys were the first in Muskingum County and the surplus stock has been sold to other farmers in that county.

Mr. Elliott had not been breeding pure-breds very long before he realized the value of Register of Merit testing, so a start was made with this work. He has found that with ordinary care and on two milkings a day, his cattle will put up Register of Merit tests that win medal awards.

In this connection we are able to announce that the Jersey bull, Lucette's Majesty, Mr. Elliott's herd sire, has just qualified for a silver medal on the production records of four of his daughters out of separate dams. Only six of Majesty's daughters have been tested up to the present, and four of these daughters have won silver medals on their first lactation.

The four daughters of Lucette's Majesty that have won silver medals made the following showing while on test:

Lucette's Majesty's Bessie produced 526.83 pounds fat in 365 days, starting test at two years, two months of age. Milk averaged 6.06 per cent fat and calf was carried for 233 days of the test. This record was made on two milkings a day.

The second daughter of Lucette's Majesty to win a silver medal was Majesty's Bonnie Lass, which produced 516.51 pounds fat in 365 days. Lass was two years, one month of age when she was put on test and she carried calf for 177 days of the year. She made her record on two milkings a day.

The third daughter to qualify was Majesty's Marry A. This youngster commenced test at two years, two months of age and in 305 days produced 494.53 pounds fat, carrying calf for 208 days of the test. She is owned by F. C. Hatch of Ohio.

The last daughter to become a silver medal cow is Lucette's Majesty's Lass. Starting test at one year, eleven months of age she produced 421.74 pounds fat in 305 days, carrying calf 165 days of the test. Lass is still owned by Mr. Elliott.

Mr. Elliott finds it economical to mix feed himself. He has been using a ration made up of equal parts, by weight, of corn, oats, oil meal, cotton seed, bran, and gluten, but is ready to admit that feeding is an art about which one can learn a great deal.

The cows on test are out at pasture all summer with the herd, and receive no special care. Milking is done as regularly as possible, but this is hard to arrange at times for with 160 acres and no hired help, except at harvest, there seems to be no end of work on hand.—The American Jersey Cattle Club.

FINANCIAL KING'S INTEREST AND HER 20TH CALF

Word has been received that Financial King's interest, the pure-bred Jersey that holds the world's record for reproduction, all breeds, died at the Greystone Jersey Farm, Pennsylvania, at the age of 24 years and 7 months.

This marks the close of one of the most notable careers that is to be found in live stock history, for during her lifetime Financial King's Interest was the mother of twenty heifer calves and one bull calf. Unfortunately she was not tested until she was in her nineteenth year, but even at that great age she produced, with calf, 401.09 pounds of butterfat, and followed this with another official test in her twentieth year, when she again produced over 400 pounds of fat.

Missouri Club Winners

HOARD'S DAIRYMAN:—The Jersey calf club team from Dekalb County, Missouri, won the state championship in the judging and demonstration

MISSOURI DAIRY TEAM

Left to right:—L. N. Thornton, L. Owens, H. Donovan, J. Flint (Local Leader), and County Agent V. B. Sheldon.

contests at the Missouri State Fair. This gives them a free trip to the National Dairy Show at Milwaukee, where they will compete with similar teams from other states. This trip is being provided by the St. Louis Chamber of Commerce, the National Dairy Association, and the Blue Valley Creamery Company.

Approximately fifty dairy clubs are now operating in the state. Every county with one or more clubs was eligible to enter the team from its champion club in the State Fair contests. It is planned to award this trip each year so that every club has a real prize to work for.

The boys who will make the trip are Louin Thornton, Lawrence Owens, and Harry Donovan, with Joe Flint, local leader, and V. B. Sheldon, county agent. All are from Marysville, Mo. They will be accompanied by M. J. Regan, dairy specialist for the Missouri College of Agriculture. They plan to drive through to Milwaukee, visiting the Agricultural Colleges at Ames, Iowa, and Madison, Wisconsin, on the way as well as the Waterloo Dairy Cattle Congress and many of the leading dairy herds of the country.

Missouri. E. M. HARMON.

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, AUG. 28—The discussion of a proper standard for ice cream occupied most of the time of the American Dairy Federation meeting as well as of the Wednesday session of the Joint Committee on Standards and Definitions. Although there was no decision, the arguments of the representatives of the ice cream association were so vigorously opposed to the proposed twelve per cent fat standard that it was the concensus of opinion that this had been defeated. On the other hand, it was evident that members of the committee were far from convinced that the eight per cent fat standard which the ice cream manufacturers asked for was satisfactory.

Several questions were raised with reference to the tentative standard, the chief being the amount of fat required. The second question was relative to the kind of sweetening agent which would be permitted. The present practice is to use dextrose or corn sugar in some instances, and especially as a check on the price of sucrose or cane and beet sugar.

A third question raised is as to the use of artificial coloring matter. It is permitted at present by the laws of some of the states, but the proposed federal standard seeks to prevent the use of artificial coloring unless it is so declared on the label. The ice cream makers protest vigorously against this limitation, saying that the use of a limited amount of color in ice cream, as long as the fat content is regulated and provided for, could not be construed as intended to cover up fat deficiency and therefore was not fraudulent in any way. Its use in ice cream, they asserted, was exactly parallel to its use in butter.

A fourth question was relative to a weight limit. It was stated that with the continuous mix systems it was impossible to control weight, especially in the frozen product removed from the machine at the end of the operation.

M. D. Munn, speaking at the hearing, raised the question of sufficient milk solids other than fat. He said that under the experience of the ice cream makers and their research men, fully verified by the state and government scientists, the per cent of total milk solids was limited by the amount of milk sugar which could be held in solution, thus obviating difficulty with "sandy" ice cream. Therefore the milk solids, not fat, were limited by the amount of fat permitted to be used. That is, if total milk solids could not exceed 20 per cent and 12 per cent must be fat, then other milk solids must be limited to eight per cent. This percentage of milk solids, not fat, was not enough, in Mr. Munn's opinion, to make ice cream as good a food as it ought to be.

Chairman Skinner of the Joint Committee made a statement indicating that for the moment he was more concerned in securing a standard and definition which would make the name "ice cream" mean just what the public expected ice cream to be, than in either the dietetic or economic sides of the question. Some parts of the dairy industry, he said, wanted as high a butterfat content as possible, because this made a market for more butterfat. Some other parts might want a lower butterfat, because this made ice cream cheaper to make. Some other interests wanted to use dextrose, because it made a market for dextrose or permitted a cheaper sweetener. Some others wanted more milk solids used because it made a more healthful cream.

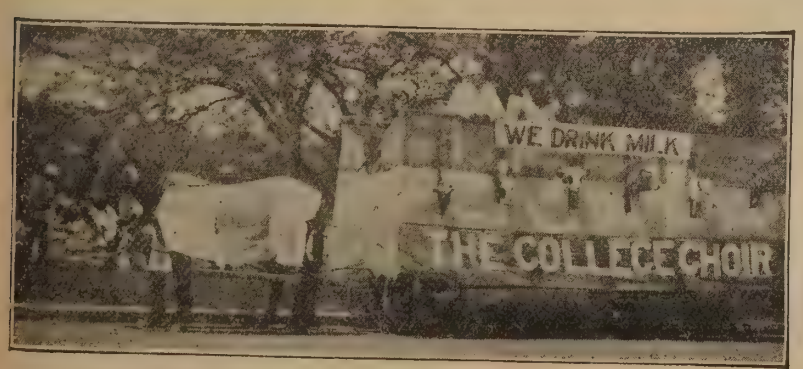
The Joint Committee would not try to choose between these, but wanted to determine just what ice cream really is and what the average person expected to get when ordering ice cream. On this basis it would fix the standard. All the other kinds, ranging from a water ice, to a 25 per cent fat mixture, or a frozen pudding made up of eggs and corn starch. could be made, the only question being to provide a system of names which tells the purchaser just what it is he is buying.

It was thought likely at the close of the hearing that a decision to fix the butterfat standard at ten per cent, was most likely.

⚜

Following the hearing with the Joint Committee, it was decided by the Ice Cream Association officers to send a delegation to the Chattanooga Convention of the Dairy, Food, and Drug Officials to present their case to the entire body. M. D. Munn also thought that it would be best if he attended to present the case for milk solids as a part of the educational work of the National Dairy Council. Dr. C. W. Larson will also attend the Chattanooga session as the representative of the Bureau of Dairying.

⚜



The American Dairy Federation at its executive committee meeting here Tuesday decided to call a general meeting of the Federation at Milwaukee, October 1. The sessions will be held at the Hotel Wisconsin, October 1, at 4 p. m.

⚜

A special committee with Charles L. Hill of Rosendale, Wis., as chairman, has been appointed by the American Dairy Federation, to report on the methods of estimating indemnities for cattle killed in foot-and-mouth epidemics. This committee will report at the Milwaukee meeting.

⚜

A. M. Loomis of the National Dairy Union and the American Dairy Federation office is on a vacation trip at his old home in Western New York, to be gone ten days or two weeks.

Do You Milk Cows for a Profit or a Loss?

Not such a foolish question as it sounds. Thousands of dairymen are milking thousands of cows, twice every day, without realizing a penny in return for their trouble. They don't know it because they don't keep records of feed consumed and milk produced by each cow each day.

When you have your cows back in stanchions this fall, start keeping records. Get rid of the boarders if you have to give them away. Feed a ration built around BUFFALO CORN GLUTEN FEED or DIAMOND CORN GLUTEN MEAL as its protein basis. Unprofitable cows on such a ration are apt to be unprofitable on any ration.

Spend less for feed and boost the milk price by eliminating the costly surplus from boarder cows. Fewer cows, better cows and the right feed will do it—make up your mind to that this fall .....We have a ration card that will help you. Write for it.

Why Illinois Dairyman Should Believe in T. B. Test

(Continued from page 172)

treated in an honest, fair, and businesslike manner, provided you do not plug your cows before the test or induce a crooked veterinarian with a piece of change to pass your cows whether they are reactors or not.

6. The authorities which advised you in regard to the fencing of your accredited herd surely must have been authorities on some "old maids' sewing society" instead of officers in tuberculosis eradication work. There are no such regulations.

7. It is true there are many farmers who have suffered losses as the result of tuberculosis eradication work. It was their misfortune and I am sorry for them. It was not on account of the poor judgment shown in submitting their herds to the work. They should have used their judgment when they started their herds and made the start with clean herds and kept them clean. It has been done many times and can be done again, with but comparatively small expense. And it is my opinion that the work will be carried on in a much more satisfactory manner than heretofore, after such herds as the Illinois Dairyman's are out of the way in accordance with the area plan of testing.

8. Tubercle bacilli are killed in milk when properly pasteurized.

9. The limit of appraisement in Ohio for reactors in accordance with area testing is $120 for registered cattle and $60 for grades. The federal government pays one-third, the state one-third, and the owner stands one-third of the loss.

10. I can not answer this question because I have no statistics or otherwise in regard to the tracing of human infection to the bovine type of tuberculosis in the rural districts of Illinois.

11. It appears to me that the propaganda, as you call it, to aid tuberculosis eradication work is quite popular among the largest per cent of the best dairymen in this country of ours.

12. Raw milk from a cow affected with tuberculosis is not fit for food. If that particular cow is slaughtered and her carcass passes government meat inspection, it is considered to be fit for food for the following reasons: 1. Autopsy has been held on this animal and the tuberculosis lesions and their extent and condition have been ascertained by an expert meat inspector, and according to his rules is discarded, if considered dangerous, or passed if not considered dangerous. 2. The meat is heated when it goes through the process of cooking and the tuberculosis germs are destroyed, if any are present. If the milk is used we have no means of knowing the extent or virulence of the lesions in that cow's body. Cows on which autopsy has been held do not give milk. Therefore, if that cow happens to be one which is throwing off tubercle bacilli with her secretions the live germs are apt to reach the stomachs of many innocent babes who depend so largely upon milk from "Old Bos" to prepare them for a future generation.

It does not seem practical in my mind to submit a sample of each cow's milk to a bacteria examination to learn the quality of her product, especially that of a reactor which is liable, at any time, to put off the deadly germs with her secretions.

Now, Mr. Illinois Dairyman, tell me if, in your mind, the tuberculin test is not reliable, why is it not a mistake in a pure-bred herd, as well as in any other kind of a herd? Perhaps I can answer for you. Is it because you haven't got one?

Connecticut College Ayrshire Produces Six Tons of Milk

Mauchlin Snowdrop 2d, an Ayrshire, bred and developed at the Agricultural College at Storrs, Connecticut, has produced in eleven and one-third calendar years 101,729 lbs. milk, 4,321.58 lbs. fat, with fat tests taken every ten-day period. During this time she completed eight consecutive yearly Advanced Registry records, her official production being 95,381 lbs. milk, 3,993.68 lbs. fat. Her latest official record is 13,042 lbs. milk, 516.20 lbs. butterfat, completed at over 13 years of age. This is the largest production made by a cow in Connecticut at this age.

Her lifetime production of milk sold for $3,518.22, netting $1,557.76 above feed cost. In every year she has returned a substantial profit, even when milk brought its lowest price, $2.34 per 100 lbs. in 1913 and 1914, her product returned $176.20 above feed cost. She made her best record in 1918, giving 14,680 lbs. milk. Her feed record shows that she received a daily average of but 15 lbs. grain that year. In her thirteenth year her profit amounted to $249.58.

In addition to her heavy and consistent production Mauchlin Snowdrop 2d has increased the college herd with nine calves. She has many granddaughters and one great granddaughter. One of her sons at present is heading a dairy in Porto Rico.

Two daughters of Mauchlin Snowdrop 2d which have completed records thus far, show every indication that her offspring have inherited her producing ability. Mauchlin Whitehill True, in three years for the Advanced Registry, has a total yield of 26,753 lbs. of milk, testing 4.6 per cent, which sold for $1,070.17, her feed cost during this time amounting to $516.28, leaving a net

AYRSHIRE COW, MAUCHLIN SNOWDROP 2D

balance of $553.90. The other daughter, Mauchlin Snowdrop of Storrs, in two years has yielded 21,975 lbs. milk at a feed cost of $404.34, and sold for $875.71, returning a profit of $471.37.—Ayrshire Breeders' Association, Vermont.

"Heaven," says the old fashioned saw, "is an income of a dollar and an outlay of ninety cents, while hell is an income of a dollar and an outgo of a dollar ten." The creation of even a small surplus is the simplest thing in the world to plan and the hardest thing in the world for most people to carry out.

Dunn County, Wisconsin, has notified National Dairy Show officials that it will send a carload of C. T. A. cows and a carload of club calves. The county raised $500 to finance the project.

An Arkansas Dairy Community

(Continued from page 174)

costs." Incidentally, Mr. White gave the information that he diversifies in other ways. From 3 acres of strawberries this year he sold over $1,300 worth and made a profit of over $700.

Mr. W. K. Beard was introduced as one farmer who was enabled to live without dairying. In spite of the boll weevil he had been making money by his skillful farming, but he entered into the diversified program more to give his boys facilities for practice in the care and management of live stock. Mr. Beard is a progressive, public spirited citizen, and last year when the school funds were short Mr. Beard turned over 10 acres of cotton land to Mr. Arnold, the Smith-Hughes teacher, who farmed it with donated labor and gave the proceeds to the school. Alton Beard, his son, 16 years of age, has the distinction of having the most diversified farm practice program in the community. Under the supervision of the agriculture instructor he has poultry, swine, cotton, and sorghum projects.

One of the remarkable things noted in this survey was the ability of the farmers to talk in terms of economics, cost accounting, labor incomes, net profits, assets, liabilities, and overhead were used repeatedly, thus showing that these farmers have made a study of the farm business and know at all times what they are doing.

The Smith-Hughes agricultural work has been operating in this locality four years and the objectives, which are Better Farm Practice, Better Farm Business, and Better Farm Living, are well on the way to a full realization.

Friendly Talks for Farm Folks

Shem Luscomb tells a story about a young drummer who became discouraged early in the game because he couldn't land enough orders from the storekeepers to make any sort of a profitable salary. He would go from store to store, and in a pessimistic way would say, "I don't suppose there is anything in my line you need today, is there?" Of course, the anti-suggestion always worked and there never was. Finally the youthful knight of the road wrote in to his boss: "I may as well quit making this territory. There's no opportunity here. I can't get any orders as nine men are already ahead of me." Promptly the manager of his firm wired back, "Get a move on out there, you lazy loafer, there's twelve good men behind you."

⚜

Art Russell keeps such a bevy of cats to keep away the mice from the grain that it fairly rains felines when you go near his barns. Art started in being real kind and good to his cats, feeding them liberally of new milk so that they would like his place and feel homelike and contented there. He succeeded so well that the wise animals shortly made up their minds that it would be foolish to rustle after rats and mice when other providing was made so liberally on schedule. So the cats quit chasing rodents and incidentally to increase and multiply, and as Art tells it, in a month or so it required all the milk from one of his prize pail-fillers to feed the pesky bunch. Since when Art let down with a painful suddenness on the liquid provisions, and the cats began to dig around for their lawful prey as the Lord intended. You can go into the Russell barns now and not find a thing running around on four legs excepting cats. No one, not even a pussy, is going to hunt for a living if it comes to one on a platter.

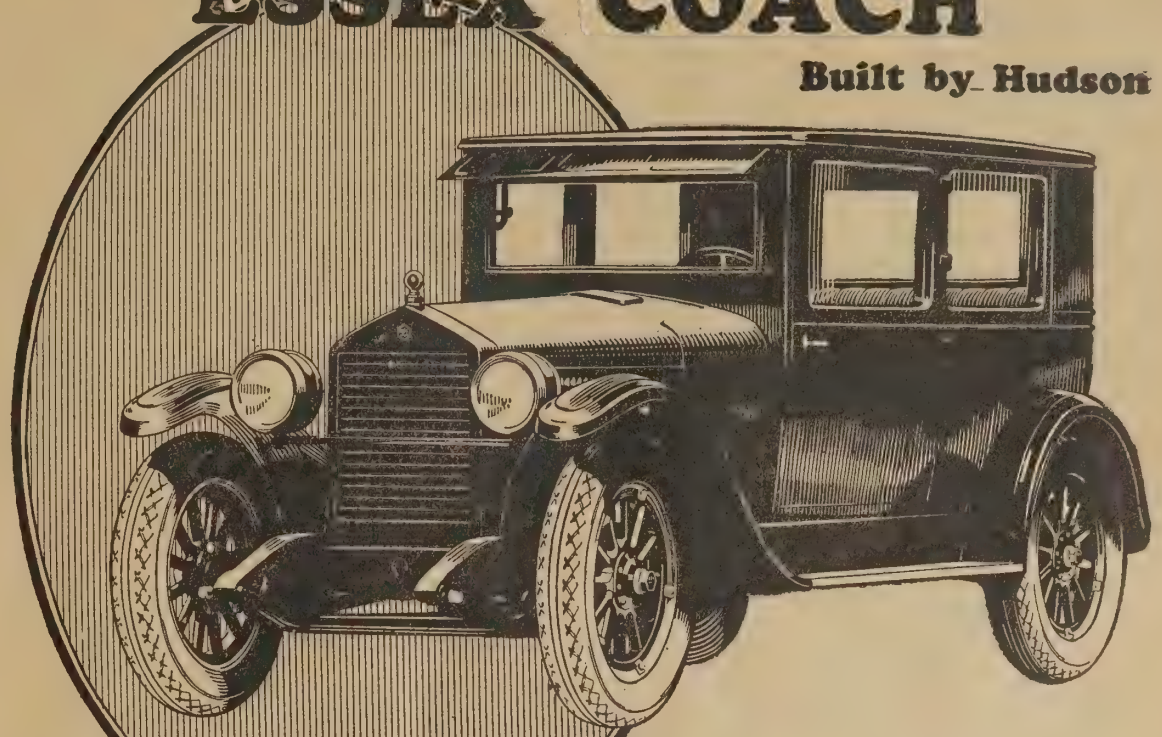
⚜

Old Silas Horner is considered a canny soul around these parts. He and Deacon Hopkins were dickering one day over a cow Silas was thinking of purchasing from the Deacon. "That old caow of mine has her good pin't's, Sile, she has her good pin'ts," the Deacon asserted earnestly. "Wa'al," drawled Silas, "That may all be; but I calklate you got to agree, Deacon, that a caow's to be jedged by her quarts 'stead o' her pints." But in the end Silas bought the "caow".

⚜

Whoever it was who invented that expression, "The fat of the land", undoubtedly referred to butterfat. Only a cow could take green grasses and weeds and flowers and grains and combine them into sufficient fats and proteins and the like to feed the world.

⚜



Somebody has said that the easiest thing a car driver can run into is debt. Most pedestrians make a frantic, if eleventh-hour, effort to avoid the wild steering of the autoist, but old Man Debt just seems to invite a knock-down forty times a day. You've probably noticed yourself that he is a daily casualty.

⚜

As we observe our remaining forests being merrily cut down to the tune of the ravenous sawmill, we wish the Lord had provided trees with a bark which really could in a most threatening manner.

New York. HELEN S. K. WILLCOX.

At Open Car Cost
ESSEX COACH
Built by Hudson

Genuine Balloon Tires
Standard Equipment

The outstanding buying choice this year is "Closed Car Comforts at Open Car Cost." The Coach alone provides them. It is exclusive to Hudson and Essex. Everyone knows it gives highest closed car value. And because no other type or car shares its position it is the largest selling 6-cylinder closed car in the world.

Genuine Balloon Tires Enhance World's Greatest Value

Naturally when balloon tires had established their superiority Hudson and Essex would adopt them. They are now standard equipment. They add an even greater measure of riding ease, steadiness and good looks to the notable values of the Coach.

In workmanship, materials and design both Hudson and Essex are of one quality—built in the same factories, under the same patents.

Everyone wants closed car comforts. They will no longer accept half-utility when all-year usefulness and comforts cost no more in the Coach.

Consider how the growing trend to closed cars affects resale values. The diminishing demand for open cars means far faster depreciation in that type. As the wanted type, the Coach maintains exceptionally high resale value.

ESSEX SIX COACH
$1000

HUDSON SUPER-SIX COACH
$1500
Freight and Tax Extra

So Why Buy an Open Car?

Better Bottles for a Quarter Century

WINSLOW bottles have a long record—and a good one. They are better bottles today than ever before. Their annual output runs high into the millions—and their national distribution is among discriminating buyers who are *consistently true to quality.*

WINSLOW MILK BOTTLES

are extra strong, crystal clear, and accurate in measurement. Along with improvements in the bottles we have improved the machinery for making them. Today all Winslow bottles are made by our own special machines.

As proof of better quality, send for a sample bottle. Test it for strength, "color," uniformity, accuracy. Compare it with others. Whether you buy bottles by the dozen or the carload, send today for sample bottle and prices.

THE WINSLOW GLASS CO.
741 Southwood Avenue COLUMBUS, OHIO

WINSLOW MILK BOTTLES ARE CARRIED IN STOCK BY THE FOLLOWING:

The Creamery Package Mfg. Co., National Distributors, Chicago, Illinois

WAYSIDE MUSINGS

THE GARDEN OF HAPPINESS

JOSEPH S. MORRIS, WISCONSIN

THE great quest of humanity has been for happiness. Consciously or unconsciously the man in the city and the man on the farm have had as the goal of their endeavors the finding of the garden of happiness.

If the truth were fully told most of us would have to admit that we had failed to find happiness in the sense in which the heart of each one of us yearns for it. The trouble may be that we have always been so busy that we have not had time to define happiness. Certainly we cannot expect to find anything unless we really know what it is we are looking for.

The Master Teacher of nearly two thousand years of time has said that happiness is to be found by those who are poor in spirit, by those who mourn, by those who are meek, by those who hunger for better things, by those who are merciful, by those who are pure in heart, by those who are peacefully inclined, by those who have suffered in good causes.

It is just here that we come to the very heart of the matter. Its underlying meaning is that we carry with us an abiding confidence in the Eternal Goodness which is at the center of all the life of the world. It does not mean that we shall find happiness by refusing to face all the facts of life but rather the opposite. I am thinking of a farmer I knew in Pennsylvania. Passing the kitchen door early in the morning I saw him at his devotions, kneeling on the bare kitchen floor. He seemed to gain strength from the book of his faith and from his humble communion with the Eternal. His problems and burdens were the problems and burdens of other men of his vocation. He seemed to gain self-mastery, poise, and happiness from his way of life. He was well liked among men. He had great patience with and sympathy for all his fellow men.

It is true that every man has his burdens and his problems. Each failure as well as each success serves to make him stronger. Have we been turning "outward" in our quest for happiness? Seeking it in things and in thrills? Suppose we were to reverse the process and turn "inward", within ourselves. The happy life is the life that has enriched itself by putting into the soul those things that produced a crop of happiness.

A man needs friendships, and neighbors, rest, and work, social life and quiet, religion, books, exchange of ideas, and a little fishing trip now and again to help fertilize the soil of his life. By and by he comes to realize that he has found the garden of happiness because he has planted it in his own soul. Some of the most inspiring and helpful men I have known have been farmers who had not only rich farm lands, but rich souls as well. A whole countryside has been blest and enriched by them.

The most completely and perfectly happy man of the ages is the man of the greatest simplicity of life. Simplicity is not poverty. It is often the greatest wealth.

If we cannot find a measure of happiness right where we are, in the very things we may now be discontented with, it is doubtful if we shall ever find it anywhere. The garden of happiness must be planted within you. If it is not there you will not find it anywhere though you have much wealth and travel to the ends of the earth.

Handling Immature Corn

Foreseeing that in all probability there will be much soft or immature corn grown in Minnesota this year, Professor Andrew Boss, vice-director of the Minnesota Experiment Station, makes several suggestions as to how such corn as may be harvested can be saved and fed to the best advantage.

"Corn is short and the yield will be light in most cases", says Professor Boss. "There has been frost damage already in low spots and in the northern part of the state. The chances are that many farmers will be obliged to face the problem of handling a soft crop."

Professor Boss' suggestions as to what can be done in the emergency are:

1.—Husk and crib all mature corn for it will be in strong demand before the next crop matures.

2.—Put as much as possible of the soft corn in the silo. Those who do not have silos can preserve corn satisfactorily by the shock method.

3.—Cut as soon as frost is indicated and shock well in large tightly bound shocks. Re-shocking is necessary as the corn cures so as to keep the shocks erect and weather proof. Feed as dry fodder or use to refill the silos when empty from the first filling. If used for silage after drying it may be necessary to add some water in filling.

4.—Turn fattening cattle, hogs, and sheep into the field before the stalks are wasted, thus saving the labor of harvesting and storing. Market the stock as rapidly as it finishes or when the corn is gone.

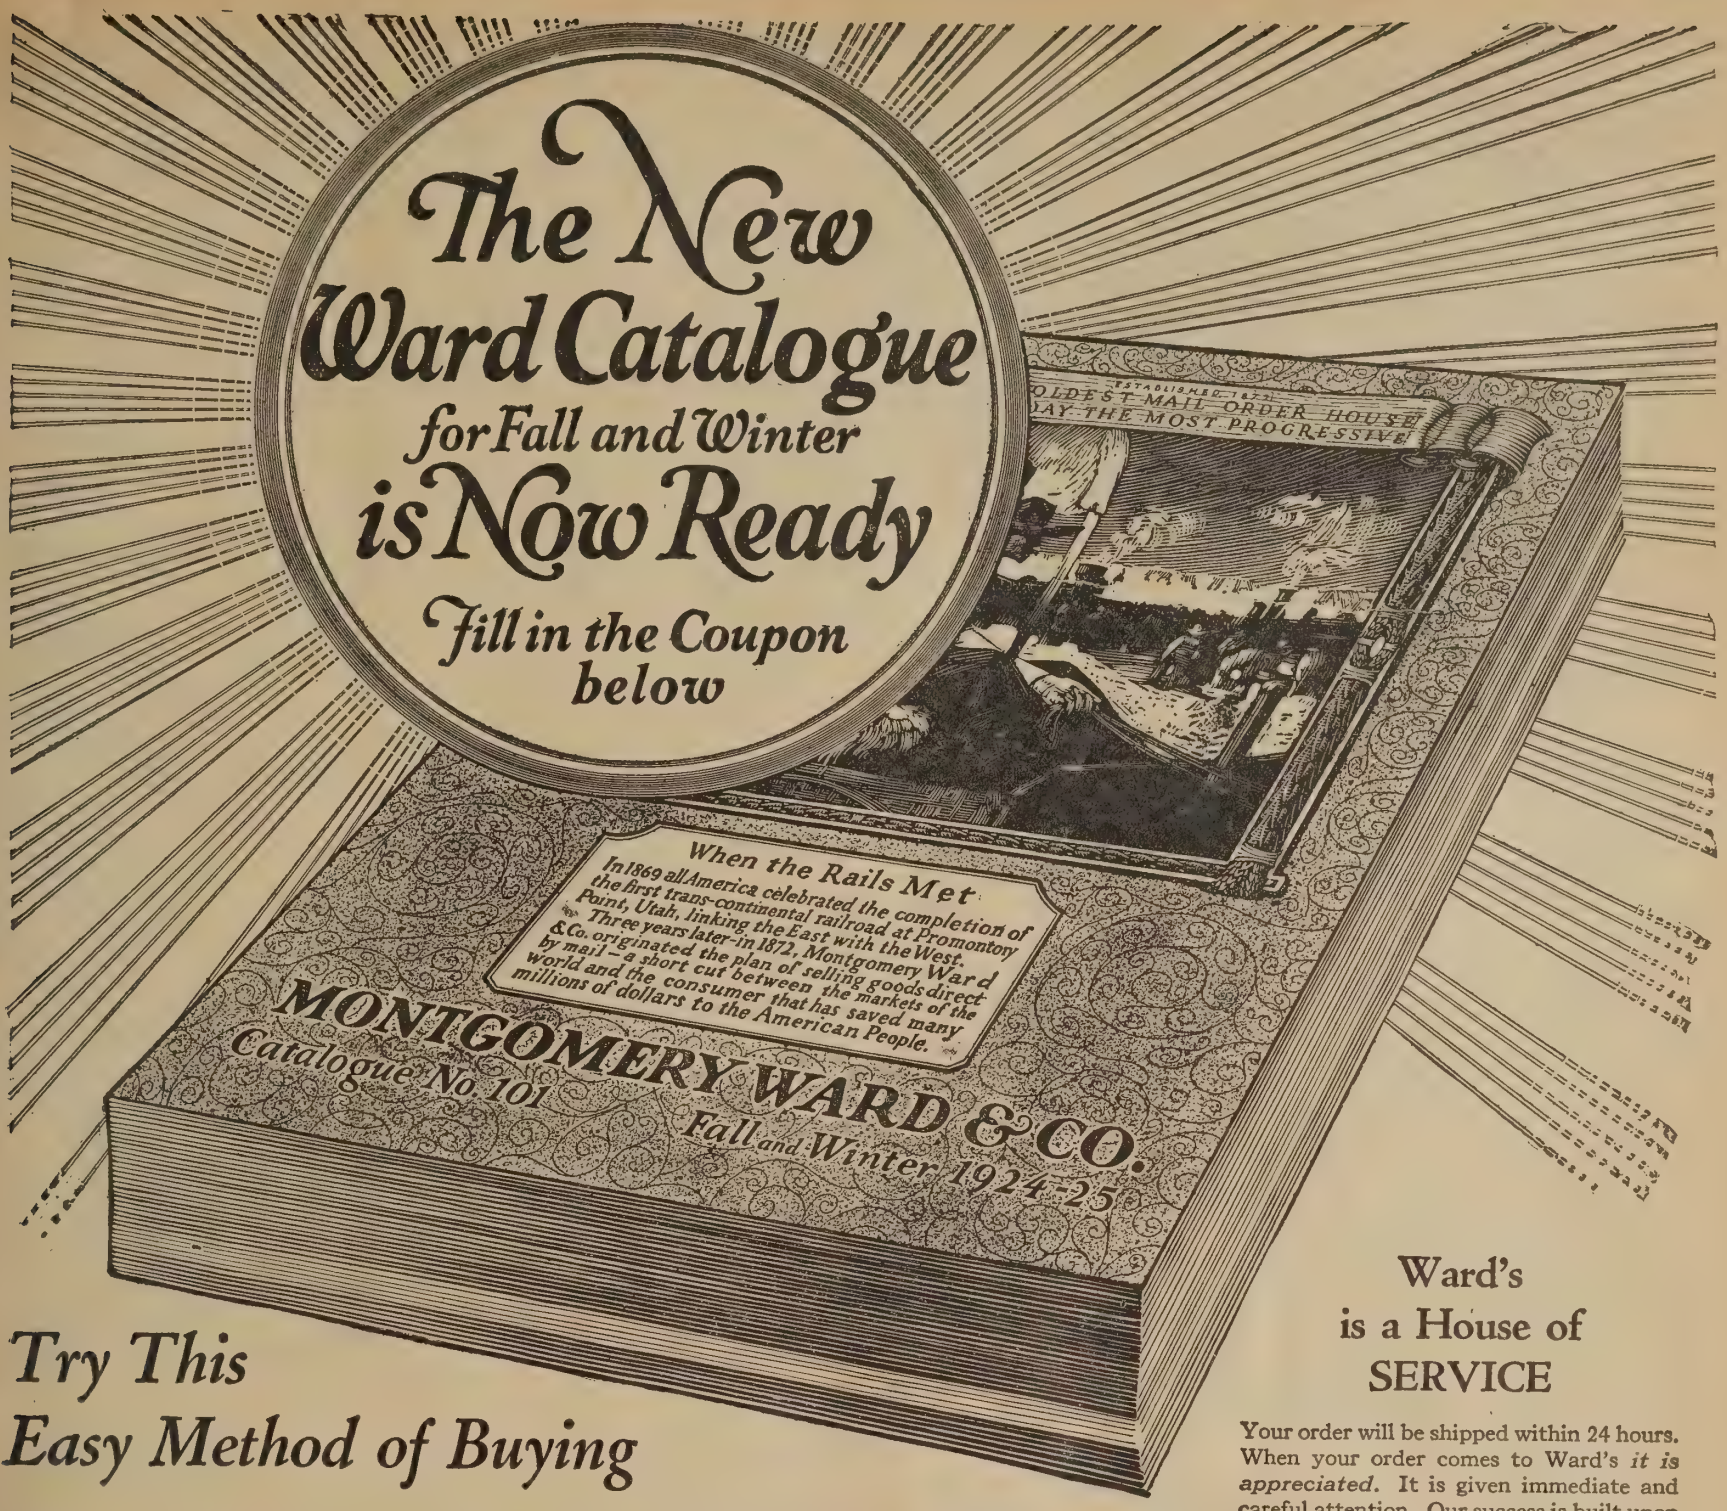
5.—Snap and crib for winter feeding all corn that has reached the hard glazed or dented stage. The cribs should be narrow and ventilation should be provided by the insertion of poles or tile through the length or crosswise of the crib.

Professor Boss makes three suggestions for the securing of seed for next year's planting. These are:

1.—Save all stocks of seed of good germinating quality from last year's crop.

2.—Have a seed corn week on your farm and pick and cure the most mature ears. Corn that has reached the glazed stage can be used for seed if properly cured and stored. It is best, of course, to pick the mature ears.

3.—Farmers who cannot pick from their own fields seed corn for next year's use should make arrangements for getting it this fall. The chances are that there will be a serious shortage of satisfactory seed corn next spring.



Milked Dry

Six-year-old Freddy, bred in the city, was on his first visit to his uncle's farm. At breakfast he heard that his uncle's Jersey cow had been stolen during the night.

"That's a good joke on the man who stole her," was Freddy's comment.

"Why?" asked his uncle.

"Why, just before supper last night the hired man took all the milk out of her."—From Everybody's Magazine.

Try This Easy Method of Buying

THIS new 726-page Catalogue will bring a new opportunity for saving and satisfaction into your home.

You can tell how much this book will mean to you only by trial. Therefore, we make you this offer—one copy of this catalogue is yours *free*. Send for it. See for yourself that no other method of buying is so easy and pleasant as ordering by mail from Ward's. You study prices and descriptions at your leisure in your own home—then merely sit down and list the things you want.

Your Savings Will Be Large

$50,000,000 worth of merchandise was bought for this book. Bought by expert buyers in the best markets of the world—men whose trade is "buying," whose only orders were, "Buy merchandise of quality, but buy at prices that will bring our customers the *greatest possible savings.*"

It is a very great satisfaction to be *sure of the quality of everything you buy*. At Ward's only reliable goods are sold. We offer no price baits. We never make a seemingly low price by sacrificing quality. We offer you only goods that will give you satisfaction—goods that will win you as a customer of Ward's.

For 52 years we have definitely guaranteed every transaction—"Your money back if you are not satisfied." For 52 years our name has stood for unquestioned reliability and honest dealing.

500,000 More Families Started Buying at Ward's Last Year

Half a million more families started buying at Ward's last year! Half a million more families changed their habits of purchasing and took up this modern way of shopping—*this most economical way of buying*. Why not you, too?

Ward's is a House of SERVICE

Your order will be shipped within 24 hours. When your order comes to Ward's *it is appreciated*. It is given immediate and careful attention. Our success is built upon our service to our customers.

So accept our offer. Send for this 726-page Catalogue. One trial of this simple economical method of shopping will convince you of the satisfaction and saving in buying by mail at Ward's.

The coupon will bring you your Catalogue free. It costs you nothing to find out for yourself. Clip the coupon now. Send for the Catalogue today.

The Oldest Mail Order House is Today the Most Progressive

Chicago Kansas City St. Paul Portland, Ore. Oakland, Calif. Ft. Worth

Barrett Shingles can be laid right over old wooden shingles, a big saving in laying cost

Yes! Some Factory Methods are Practical for the Farm

American manufacturers have found that maintenance is one of the big secrets of efficient factory management. And it would pay American farm owners to follow their lead. When house or barn needs repairs don't put it off. Paint where needed. Replace the shabby, patched old roofs.

Spruce up your farm buildings with substantial new roofs. Real estate men will tell you that sturdy handsome roofs are a big factor in getting your price if you ever want to sell.

For your house, Barrett Shingles furnish a roof that is colorful, fire-safe and lastingly weathertight. Sparks and embers falling on a Barrett Roof burn out harmlessly. This is important to the man living far from a good fire department.

For your barns, sheds, etc., Barrett Roll Roofings are the accepted standard. They're durable, easy and economical to lay, and highly fire-resistant. Once you put Barrett Roofings on your buildings, these roofs are off your mind to *stay off*. No more worry about leaks, no painting or patching. Barrett Roofs won't rot or rust.

Call on the nearest Barrett dealer. Ask to see Barrett Roofings. (Leading lumber, building supply and hardware merchants carry them.) There's a Barrett Roofing that's 100% right for any building on your farm.

Barrett ROOFINGS

Your Choice of Six Styles

Everlastic Smooth-Surfaced Roofing

A roll roofing of best grade roofling felt, saturated with high grade waterproofing material. Made in medium and heavy weights. Tough, pliable, elastic, durable, low in price, and easy to lay.

Everlastic Mineral-Surfaced Roofing

A beautiful and enduring roll roofing. Mineral-surfaced in red, green, or blue-black. Popular for cottages, garages, farm buildings.

Everlastic Giant Shingles

Handsome enough for the expensive home, economical enough for small farm house or cottage. Mineral-surfaced in beautiful shades of red, green, or blue-black, with extra-thick, extra-rigid base. Size 8" x 12¾".

Everlastic Single Shingles

Identical in shape with Giant Shingles but not quite as heavy. Mineral-surfaced in same beautiful colors. Need no painting, are fire-resisting.

Everlastic Multi-Shingles

Four shingles to a strip. Mineral-surfaced in red, green, or blue-black. Two sizes—10 or 12½ inches deep, both 32 inches long, providing two or three-ply roof when laid 4 inches to weather.

Everlastic Octagonal Strip Shingles

The newest mineral-surfaced strip shingle. Colors: red, green, or blue-black. Can be laid in novel designs by interchanging red strips with green, or red strips with blue-black.

Association Notes By Testers

Gray's Harbor, Wash.: Practically all members feed grain and hay to supplement pastures. Pastures are very dry for this time of the year and production is decreasing proportionately. The condensery and cheese factory paid 47 cents per lb. for fat. Milk retailed for 10 cents per quart. —F. R. Haynes.

Macomb No. 2, Mich.: A new sanitary milk house was constructed and four tubular coolers were installed. Fifteen tubular coolers are now in use by members of this association. The general report of the users is that it reduces the amount of milk sent back, not being 60 degrees. One member turned cattle on sweet clover pasture. Cattle leave common pasture for the sweet clover. Market milk sold for $3.00 for base f. o. b. Detroit; $1.74 for surplus.—C. Blumer.

Alpine—West Kent, Mich.: A good acreage of alfalfa sown this spring is doing fine. All but three members feed grain on pasture. One new milk house was built. Market milk sold for $2.60 per cwt. The condensery paid $1.75 per cwt. for milk; the creamery, 41—43 cents per lb. for fat.—P. C. Wittenbach.

North Antrim, Mich.: This association completed its second successful year August 8. It was reorganized at once so no time was lost on high producing cows. The association average per cow for the month of July was 678 lbs. milk, 26.8 lbs. fat; value of product, $9.90; total cost of feed, $2.20; net value of product, $7.70; returns for each dollar spent for feed, $4.48; cost per lb. fat, 8 cents; cost per 100 lbs. milk, 32 cents. Ernest Lochne had the high herd for the year with an average herd of 5.83 cows that produced 7,735 lbs. milk, 393.4 lbs. fat and netted him $87.29 per cow above cost of feed. Ruby, a pure-bred Jersey, also owned by Mr. Lochne, took the honors for high cows with 484.6 lbs. fat.

Branch Co., Mich.: The association average for July was 672 lbs. milk, 28.93 lbs. fat. E. L. Stauder has a herd of 19 high grade Holsteins which averaged 1,049 lbs. milk, 34.98 lbs. fat on just pasture and silage. Fifteen members feed grain with pasture. Market milk sold for $2.50 per cwt. and retailed for 12 cents per quart. The creamery paid 37 cents per lb. for fat.—L. Q. Kitchen.

Allenton—Kohlsville, Wis.: The proven sire, Cedar Lawn Canary Paul 6th, at 10 years of age, leads 10 of his tested daughters, better than their dams, as a cow testing association exhibit from the association at the coming National Dairy Show. The Wisconsin Holstein-Friesian Association is in charge of this special feature, paying all expenses. The condensery paid $1.88 per cwt. for milk; the cheese factory, $1.50. Milk retailed for 8 cents per quart in July.—V. M. Anderson.

Pierce Co., Wis.: In the month of July 2,074 cows were tested in the five associations, of which 260 produced 40 lbs. fat or over. Plenty of rain and cool weather help pasture and cows are holding up fairly well on production. Creameries paid 38—43 cents for July fat. Second cutting of alfalfa is being gathered and grain cutting practically done and some have already started threshing. Favorable weather will make ripe corn if no frost for three more weeks.—C. Engleman.

Orangeville—Sharpsville, Pa.: The second annual cattle show of this association was held Aug. 15. Seventy-five cattle were on exhibition; all, excepting ten, being pure-bred. Ayrshire, Guernsey, Holstein, and Jersey breeds were represented.

A parade was staged which included the highest producing cows in each of the dairy breeds. Little girls dressed as fairies led each breed group with an appropriate placard and each cow was accompanied by a boy carrying a banner showing the cow's yearly production of milk and butterfat. Several of these cows later won ribbons in the judging ring, a proof that type and production go hand in hand.

The judging was of a demonstrational nature and was followed with keen interest by those in attendance. A prominent feature of the day was a boys' and girls' judging contest.

This association was organized in 1922. The average production per cow in 1923 showed an increase of 715 pounds milk and 30.1 pounds fat above that of the previous year and all indications point to another decided increase for 1924. The 1923 average per cow was 7,483 pounds of milk and 296.9 pounds butterfat. Every member is using a pure-bred sire and all are feeding balanced rations.

To H. S. Service, tester for this association, in co-operation with County Agent W. S. Hagar of Mercer County, is due the splendid association progress being made and the success of this annual show.—E. B. Fitts.

Entries for Show and Sale

All entries for the grade cow exhibit and sale must be in by Saturday, September 6. Get the entry blanks for the Show from W. E. Skinner, 414 Carpenter Bldg., Milwaukee. Get entry blanks for the sale from C. L. Hill, Rosendale, Wis. The Holstein-Friesian Association of America is offering $300 as special prizes in the Holstein classes.

Kent—Alto Report

The association year in the Kent-Alto, Mich., Cow Testing Association has been completed. Several sales occurred during the association year and each sale proved that cow testing records helped realize a better sale price.

R. D. Bancroft had the highest producing two-year-old cow. His grade Jersey made 7,679 lbs. milk and 422.4 lbs. fat. A. E. Wingiere had the high three-year-old. His grade Holstein made 13,395 lbs. milk and 468.9 lbs. fat. Roy Jones had the high four-year old. His grade Jersey made 8,938 lbs. milk and 491.4 lbs. fat. C. W. Johnson had the high cow of the association, a six-year-old pure-bred Jersey, making 8,572 lbs. milk and 577.5 lbs. fat.—D. E. Bliss, Tester.

HOOD
CHANNEL TREAD

30 x 3½ clincher cord

Low in price ~ But not a "cheap tire"

The Hood Channel Tread is well designed and well built especially for light cars. For the man who does not want to tie up money in several seasons' mileage, and yet who is not interested in cheap, "bargain" tires, the Hood Channel Tread is reliable and offers excellent value for the money.

For longer service, we recommend the Hood 'H' Tread or the Hood White Arrow Cord and for the utmost in comfort, Hood Balloon Cords (with or without wheel change).

It will be worth your while to look up the Hood Dealer in your vicinity. He will give you straight-from-the-shoulder information which will help you invest your tire money to bring the greatest returns.

Hood Rubber Products Company, Inc.

Rubber products for more than a quarter of a century.

CHEVROLET

J. H. Nagle and his family with their Chevrolet

"— a Chevrolet Would About Double My Working Hours"

"My farm is 6 miles from the town where we have to market our produce. This made it necessary for me to take my horses out of the field at least one day a week. If we went to church on Sunday it meant driving the horses most of the day instead of letting them rest. I figured if I had a Chevrolet I could go to the mill or blacksmith shop at noon while the horses were resting. It seemed as though the car would about double my working hours.

"We've had our Chevrolet four years and it has been a great benefit to us as well as a pleasure, *—and at a cost of $8.25 for repairs."*

J. H. NAGLE, Newton, Illinois

This experience is typical of the use of Chevrolet cars by thousands of farmers. A Chevrolet is especially adapted to farm work and for traveling over the rough country roads because it is sturdily built with a deep 4½ inch frame with 4-frame cross members. It has a powerful valve-in-head motor with a strong, spiral-bevel gear rear axle.

The low purchase price includes complete equipment. The experience of thousands of users proves that Chevrolet averages the lowest cost per mile. The dependable performance of the car is backed by thousands of service stations operating on a flat rate basis.

Ask your nearest Chevrolet dealer about the unusually easy payment plan.

Ever Failing or Never Failing Pasture

(Continued from page 171)

eed was used. The conclusion is hat five to eight pounds of good carified seed per acre is enough, rovided soil conditions are right, nd there is little advantage in seedng more than this amount. One ound of sweet clover seed contains bout 300,000 seeds: five pounds er acre would make 34 seeds per quare foot; if only one in seven of hese develops into a plant, it will ive five per square foot, which is lenty. If, however, the soil lacks me or the seed or soil are not inculated, it will be of no avail to sow bushel of seed per acre.

T' e Experience of Two Men

"We have used a mixture of cloers for pasture for five years. The weet clover smothered everything lse the second year. We since find wo pounds of common sweet clover plenty in the mixture, the plants rowing faster and larger.

We think that it is common to adise too high a rate of seeding of weet clover, as the thin stand will ake a more rapid top growth and, consequence, a larger deeper root, nd will in the end furnish more eed than the thicker seeding. Also the soil be not adapted to the weet clover, the amount of the eeding will not make much differnce."—C. A. Hunt, Northern Illinois.

"I sowed a mixture of two pounds sweet, four of Mammoth, and four alsike clover and four of timothy er acre with small grain. In the ring of 1923 all of the mixture inter-killed except the sweet clover hich was very thin. Notwithstandg this fact, 10 acres pastured 13 ead from April 15 to September 1." -Andrew Johnson, Northern Illiois.

dvantages and Disadvantages of a Pasture Mixture

Seeding a mixture of other clovers id grass with sweet clover affords ariety and insures against a shortge of pasture between the time the cond year crop dies and the spring eding is large enough to turn onto. ot many such cases were reported the questionnaire, but it does ocr at times. If there are acid spots a field, there is an advantage in wing a mixture because some of e other kinds of seed will grow tter in these acid places.

Some of our best farmers and rm advisers think it is best to sow mixture of clovers and a little orard grass or timothy for the reas mentioned above, while other equally thoughtful and experienced dairymen and advisers think it is better to sow the sweet clover alone, because when a mixture is sown the cows eat the finer clovers and grass in the bottom first and let the sweet clover get too high and tough before they eat much of it. If sweet clover is sown alone, they will eat it from the start and keep it down to where it is more palatable.

Nearly half of the farmers answering the questionnaire sowed red and alsike clover and timothy with their sweet clover. Where this was done, it required about 25 per cent more land to pasture a cow than where sweet clover was grown alone, because the smaller clovers and timothy do not produce as much feed per acre as does sweet clover. It also costs more per acre for the seed, where a mixture is sown.

A good combination where a mixture is desired is: sweet clover, four pounds; red, two; alsike, one; alfalfa, one; timothy, one; and orchard grass, one. Provided conditions are favorable, a seeding of 10 lbs. per acre of this mixture should make an excellent stand.

Second Year Sweet Clover a Pasture Not a Hay Crop

The stems are very large and woody in hay made from the second year's growth, and a number of dairy cattle died in Northern Illinois last winter evidently from eating this kind of hay. It caused a trouble quite similar to hemorrhagic septicemia, the cattle often bleeding to death from a slight cut. Difficulty has been experienced in Canada from the same cause and in some cases from feeding moldy sweet clover silage. Stubble clover the first fall often gives a good yield of hay of the best quality, and this trouble has never been reported from such hay.

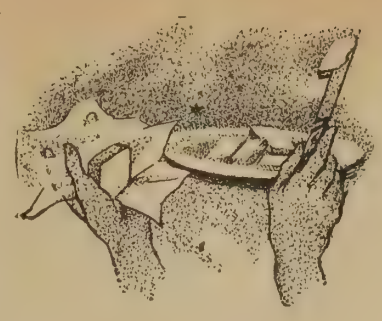
No Luck to It

Growing sweet clover is no more a matter of luck than the raising of any other hay crop. If a man doesn't lime and inoculate his soil where it needs it for sweet clover, he has no more chance of getting a stand than if he were to go through all the operations of raising corn, with the exception of planting the seed. There is no chance to it; he is beaten from the start in each case. The facts are that the only man who has "luck" with his sweet clover is the one who provides the correct conditions for its successful growth.

New Holstein Records in Maryland

Three Maryland state records for itter production among Holstein ws were broken recently by cows the herd of the Springfield State ospital herd.

Delilah Jewell Canary Repeater is w the state's leading cow of the eed for production in ten months a junior four-year-old. Her recd is 16,547.1 pounds milk and 576.36 unds butterfat equal to 720.4 unds butter.



For production in ten months as a nior three-year-old, Howard Star nette Prince holds the highest cord with 14,673.9 pounds milk and 1.04 lbs. fat (626.3 pounds butter).

Segis Manor Star, a senior twoar-old, is now the highest produce in her class for seven consecutive ys. Her record is 472.8 pounds lk, 17.31 lbs. fat, (21.64 pounds tter.)—Extension Service Holstein-iesian Ass'n. of America.

Dairy Tours

Six tours of the "dairy belt" around Milwaukee have been arranged for visitors to the National Dairy Show there, Sept. 27 to Oct. 4. The tours include trips through Waukesha, Jefferson, Dane, Dodge, and Washington Counties, the principal counties of the milk region. There will be one all day trip to Madison, the capital, and the seat of the agricultural college. The Waukesha tour will take but a few hours, and the others vary between that time and the all day ride. Commodious busses have been secured for travel, and prominent "show farms" as well as the practical small farm, will be included on each trip.

Says Sam: When at the end of a blistering day comes up a thunder shower, take a little time out quietly to see, feel, hear, and smell. It's a time when you can be glad you're alive, and out in the country.

Use Only Genuine Coleman Mantles

They Give Better Light and Last Longer

1. They are made especially for use on Coleman Quick-Lite Lamps and Lanterns—Work perfectly with the Quick-Lite gas tip and air intake in producing 300 candle power of pure-white brilliance.
2. They are full size, correctly shaped, knit to proper mesh, saturated with purest chemicals by special Coleman Process, thus insuring plenty of clear, natural, steady light.
3. Coleman Mantles are made of long-fibre Egyptian cotton and have reinforced patented bottoms, giving double strength where gas pressure is greatest.
4. Easy to attach. Best for use on all makes of gasoline lighting devices.
5. **Use only the genuine.** Look for the name "Coleman" on the mantles you buy. Get them by the box—12 to a package.

If your dealer can't supply you, order direct. Price, 10 cents each; $1.00 per dozen, postpaid. Address, Dept. H. D. 65

DAIRY MARKET NEWS

Cheese Markets

(U. S. Department of Agriculture)

Cheese markets remain unsettled, with distributing markets irregular, trading dull, and a slight reduction in price. Production continues to be large, with storage surplus heavy.

The average wholesale prices on American cheese, style Twins, for the week ending Aug. 23, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending Aug. 23 1924	Aug. 16 1924	Aug. 23 1923
	Cts.	Cts.	Cts.
New York	21.0	21.1	25.6
Chicago	18.9	19.2	23.7
Boston	21.2	21.2	25.8
San Francisco	18.9	19.0	25.5
Wisconsin Boards	18.1	18.8	24.1

The receipts of cheese at these markets were 4,107,103 lbs. for the week as compared with 5,471,827 lbs. last week and 4,934,484 lbs. a year ago.

FOND DU LAC, Wis., Aug. 27—Average cheese prices (majority of sales), f. o. b. shipping point: Twins, 18¾c; single Daisies, 19¼c; Longhorns, 19½c; square prints, 20¼c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange, Aug. 23: Single Daisies, 18c. On Farmers' Call Board Aug. 23: Single Daisies, 18c; Young Americas, 18c; Longhorns, 18c; square prints, 19c.

NEW YORK, Aug. 28—Butter—Firm; receipts, 15,144 tubs; fresh supply, 60,733 tubs; creamery extras, 38¼@38½c; specials, 39@39½c.

Eggs—Dull; receipts, 22,824 cases; fresh supply, 72,123 cases; white, fancy, 53@56c; fresh firsts, 35@43c; western whites, 36@53c.

MILWAUKEE, Aug. 28—Butter—Creamery, extra, tubs, 36½c; standards, 35½c; extra firsts, tubs, 34@35c; firsts, 32@33c; seconds, 30@31c.

Eggs—Fresh gathered firsts (new cases), including cases, candled, 33½@34c; ordinary firsts (standard cases), 32½@33c; miscellaneous lots, shippers' cases returned, candled, 30@33c; seconds, dirties, 23@24c; checks, 22@23c.

Cheese—American full cream, Twins, 18½@19c; Young Americas, 19@19½c; Longhorns, 19@19½c; Daisies, single, 18½@19c; American, 32c; Pimento, 34c; Swiss, 42c; Brick, fancy, 17@18c; Limburger, new, 18@19c; imported Swiss loaf, 42@47c.

CHICAGO, Aug. 28—The cheese market appeared a trifle steadier, although buyers still lacked confidence and confined purchases to immediate requirements. Supplies, while fairly liberal, were not burdensome and sales were well within range of prices listed. Interest in cured cheese was irregular, but fancy goods were firmly held.

CHICAGO, Aug. 28—Trade in the butter market was fair and ruled firm on all scores. Dealers were holding firm on all grades and in some cases were asking premiums. Demand centered around 89—90-scores. Some trade was reported on top scores mostly at 37¼c. The centralized car market was firm with 89- and 90- core cars short and held for premiums, but buyers showed little interest.

Fresh butter—92-score, 37¼c; 91-score, 36¼c; 90-score, 35½c; 89-score, 34½c; 88-score, 34c; 87-score, 33½c; 86-score, 32c. Centralized carlots—90-score, 36½c; 89-score, 35c; 88-score, 34c.

Wisconsin July Milk

The Wisconsin Department of Agriculture reports that the average price of milk for all purposes was $1.63 per hundred, as compared with $1.95 for July, 1923.

Butter Markets

(U. S. Department of Agriculture)

Butter markets opened with all markets firm on top scores and with increased sales during the week. Reports indicate heavier receipts and continued movement of goods into storage. Some Argentine and Danish butter, together with 325 tubs of 90-score centralized and 5 tubs fancy sweet cream American butter, were shipped to England.

The average wholesale prices on 92-score butter for the week ending Aug. 23, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending Aug. 23 1924	Aug. 16 1924	Aug. 23 1923
	Cts.	Cts.	Cts.
New York	39.1	38.3	44.5
Chicago	37.0	36.7	43.6
Philadelphia	39.8	39.2	45.6
Boston	39.3	38.6	44.6
San Francisco	40.2	40.6	45.3

The receipts of butter at these markets were 15,517,521 lbs. for the week as compared with 15,489,036 lbs. for last week and 13,121,062 lbs. a year ago.

A Nebraska Champion

N. P. ReBecky Segis Hengerveld bred and owned by the University of Nebraska North Platte Substation has completed a 365-day test as a senior 2-year-old, with 19,410.3 pounds milk and 880.43 pounds of butter (not yet reported). During the earlier part of the lactation period she was milked only three times daily. This production gives her first place among Nebraska cows in the 365-day division of the senior 2-year old class. Her sire is Varsity Derby Matador and her dam ReBecky Segis Gerben, both bred and owned by the University of Nebraska.

Nebraska. W. P. SNYDER.

California Butter Champion

California's new champion Holstein cow for butter production in ten months as a junior four-year-old is Ormsby Mechthilde Prilly of the Bridgford Holstein Company herd. Her record is 23,034.3 pounds milk containing 830.11 pounds butterfat equivalent to 1,037.6 pounds butter. This is the second highest butter record in the United States for cows in this class and is third highest for milk production, according to an announcement made by the Advanced Registry Department of The Holstein-Friesian Association of America.—Holstein-Friesian Ass'n of America.

Old lady said of Southwest—"Don't raise much except alpaca and they have to irritate the soil to raise that."—PAUL NEACY.

Flemish Beat French Cows

HOARD'S DAIRYMAN:—For some time past Belgian dairymen and farmers have claimed pride of place for their cows, declaring them to be infinitely superior to the French variety. France has retaliated by stating that the native cow has no equal, that its milk and butter have ever been unsurpassed, and that the Flemish animal is greatly overrated. The hoped-for *entente* between the two countries being in danger, the French and Belgian Ministers of Agriculture arranged that representative cows from France and Belgium should be on view at the Agricultural Show which has just taken place in Paris. The farmers of the Netherlands, confident in the superiority of their cattle, agreed, and with the result that Belgian has beaten France. Never was victory more overwhelming.

Out of the nine cows to carry off prizes, no fewer than seven were Flemish, the best of the French animals being relegated to the fifth place. The Belgian milch cow which bore away the first prize yielded sixty-four and a half *kilos* (142 lbs.) of milk in forty-eight hours, while the milk produced by another Netherlands prize winner in twenty-four hours resulted in three pounds, twelve ounces of butter being made. The two French cows on the honors list came nowhere within reach of these figures.

The French Minister of Agriculture, in making his official report on the Show, has congratulated the cowkeepers of France on the increase of the milk production. During the last twelve months it has risen by eighty-eight million gallons, and the public lives in hopes that the pre-war price will soon be reached. But this, alas, is unlikely, the annual output still being nearly two hundred and fifty million gallons less than it was ten years ago.

France. GEORGE CECIL.

New York Dairy Notes

The milk committee still meets in Utica but I doubt if it is still called the committee of fifteen. At least the three League men do not attend. The league has announced that they will meet any real representatives that wish to discuss methods and policies of better marketing. This seems to be fair. A meeting of the others was held August ninth and prices were discussed. Some still desired a resolution for a $2.33 price for fluid milk and others wanted one advising for a "higher" price. Finally it is stated that they declared for $2. It must have been about that time that the League stated $2.06 and the Sheffields went shortly to $2.10. Milk supply shortened and the League advanced to $2.60.

Quite a number of dairymen, while desiring more money for milk, feared that $2.60 under present conditions was too high. We heard nothing from the city but supposed that the retail price went up at least a cent a quart, for the League advanced almost one and three-fourths cents and the Sheffields almost a cent on the price to the farmer. The Eastern States had been trying to hold their fluid price in the city to that of the League, it is understood, before this last advance, and it is possible that they are still doing so. A League fieldman informed me that retailed bottled milk has not been advanced. That some of the milk dealers are apparently co-operating with the League in an effort to straighten out the difficulties looks encouraging. Retail prices still stay at thirteen cents, they report.

⚜

League certificates are still being bought in by the association but those of series A which may now be cashed are not offered very freely it is said. People prefer keeping them apparently. They have tangible assets back of them. The finances of the association seem to be in a strong position. There is over a half million appropriation all told for the purchase of 1927 certificates and it will doubtless be used for that purpose. There were over four million of these issued.

⚜

We are all wondering what is coming from the present price situation as respects feeds and milk. These are out of proportion and have been for a long time. The fact is getting hold of dairymen sharper than ever. Many say that they will not produce milk at these prices and many say also that they will not buy grain feeds at the present prices. A man from the state college was here a few days ago and he said that the price of cattle feeds depends on the price of milk, not so much on the price of grain. Possibly, for it is demand, not cost, that determines grain feed prices. Most good authorities expect grain feeds to decline somewhat.

It looks as though milk will bring more money from now on and may bring quite a bit more unless dairymen buy more heavily of feeds than they now say they will. Personally, I have not been able to agree that it will be better not to feed, but that may depend mostly on the cow. It means better pasture in some way, I am convinced. Does it mean more home grown oats, peas, and barley with the peas inoculated when sown? It means more clover and it seems to me more alfalfa even in this rather unfavorable section for alfalfa.

New York. H. H. LYON.

The Grandstand Umpire

A northern man, spending the summer in the South, went to see the last game of a series between two local teams. For a time he could not observe any umpire, but at last he spied him sitting up in the grandstand among the spectators.

"Great guns, man" the northerner exclaimed to a native. "What's the umpire doing up in the grandstand?"

"Well," the native explained, "the spectators used to accuse him of bum work so much that he allowed that if the folks up in the grandstand could see every play so durned good, he'd better go up there to do his umpirin'."—Everybody's Magazine.

For age and want save while you may;
No morning sun lasts a whole day.
—BENJAMIN FRANKLIN.

This Red Strand marks the Fence you ought to buy

Only in this new, perfected "Galvannealed" Square Deal do you have a chance to get wire with *so much zinc protection*. The zinc coating on "Galvannealed" Square Deal Fence is guaranteed much heavier than any other fence—from 2 to 3 times more than ordinary galvanized wire. The coating is not just laid on the outside, like frosting on a cake—*but welded right down into the body so it can't come off.*

The Triple Life Wire
Galvannealed Square Deal Fence
(No Extra Price)

—is also made from *copper-bearing* steel, which means a steel wire with copper mixed in to make it rust-resisting from the core clear to the outside.

So you may be sure you are getting this extra long lasting fence, we have marked every roll with a *Red Strand* (top wire) —this means "Galvannealed" fence.

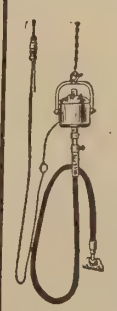
You won't even have to remember what the famous can't-slip Square Deal Knot is like—*just look for the Red Strand.*

You won't have to remember the stiff, one-piece picket-like stay wires that make fewer posts necessary and hold Square Deal straight and trim—*just look for the Red Strand.*

Don't worry if you forget to look for the full gauge well crimped strand wires that make Square Deal so springy and expand and contract with the seasons—*just look for the Red Strand*—

And, best of all, this marvelous fence is from two to three times better than the ordinary galvanized fence. Square Deal "Galvannealed" costs you no more than what you pay for the average, plain galvanized fence. In fact, it only costs half as much because it should last twice as long.

Indiana University—
Burgess Laboratories, Madison, Wisc., Robt. W. Hunt & Co., Engineers, Chicago, the railroads and many other authorities prove that "Galvannealed" out-tests all ordinary galvanized fences by 2 to 3 times, so should last 2 to 3 times longer. Before you spend another penny on fence get copies of these official tests—we will send them to you FREE.



KEYSTONE STEEL & WIRE CO.
1740 Industrial St. Peoria, Illinois

FREE
Ropp's Calculator, a handy farm book that answers 75,000 farm problems. Sent free with Square Deal catalog showing styles and dimensions and a special "Proof" telling how "Galvannealed" Square Deal is made so that it will last 2 to 3 times longer and cost no more. All three FREE to land owners. Mail postal today.

NOTICE
Square Deal Fence, famous for many years, is now made only by our new "Galvannealed" process. *Always look for the Red Strand. No extra price.* The old method requires asbestos wipes which leave only a thin zinc coating. *The new "Galvannealed" way* runs the wire thru long 28 feet zinc pans; a special heat treating operation welds into the wire this extra heavy zinc protection. This process, which results in "triple-life-wire" is owned and controlled by Keystone.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Daniel Dare Selects Seed Corn

Foreword—This is the first of a series of short stories on the "Adventures of Daniel Dare". Danny is a typical 12-year-old American farm boy. His father owns and operates an 80-acre dairy farm, and is considered a progressive, up-to-date farmer. Danny has an older brother, Tom, who never "took to farming", and two sisters. Tom expects to leave soon for his first year of college. One sister is in high school; the other is ten years old. Unlike his brother Tom, Danny is a born farmer and absorbs the latest agricultural knowledge like a sponge absorbs water. Next week Danny makes a visit and learns how to cure corn.

Daniel Dare was happy. He wore a broad smile. His father had just told him that he could have an acre of clover sod for a corn patch next year. Daniel had long wanted to be a corn club member. He had talked it in the day time and dreamed it at night. His best chum, Jimmie Watkins, was president of the K. K. K. (King Korn Klub) and champion corn club grower in Morris County. Daniel wanted to beat his chum's record.

After Danny had finished helping his father with the early morning chores, he slipped away to the south of the barn to think. He surveyed his father's corn field with pride and with awe. It was a beautiful Indian summer day. The sun shone brightly. Tomorrow would be the second of September—the first day of school. He noticed that the leaves on the corn plants were whitish in appearance.

"What's bothering you, son?" His father had come up behind unnoticed and this greeting rather startled Danny.

"I want to grow a big crop of corn on my acre, dad, and I'll need some good seed, won't I? How'll I get it?"

"What's the matter with that corn there, Danny? It's pure-bred Murdock. I usually pick my seed while the corn is still standing. It gives you a better idea of the way the corn grows. I was planning to pick mine tomorrow, but you'll be in school, won't you? C'mon, we've got a few minutes now. I'll help you. Run over to the barn and get that bag with the strap on it hanging up there by the grain bin."

Danny needed no urging—and quicker'n you could say Jack Robinson he was back again with the sack.

"Sling it over your shoulder, Dan—we'll start up this row here. Let's look for ears that are about three feet from the ground. You want to remember that like produces like and if the ears we pick are at about this height the plants grown from this seed will grow their ears like that. The ears are easy to handle at harvest time when they grow at that height."

They walked slowly down the row and Mr. Dare continued: "See here, notice this ear. It's at about the right height, and it's drooping. When they hang down at an angle like that toward the ground, they shed water better. It also shows that the ear has good weight. Let's open this one up and see what's inside." He pulled back the husks exposing long, straight rows of golden kernels. "Good—rows straight, color a good orange yellow, kernels deep and well dented, not too much cob, rows carry out to butt and tip. Let's take this one along." and he gave it a twist, tossing it into the bag. "Now you pick out one."

Daniel's first choice proved out well when he opened it. His second looked good on the outside but the rows were found to be crooked so it was left. Together father and son worked up and down the rows—Danny ahead a few paces picking them out, his father tactfully watching, occasionally giving a bit of advice.

"Say, dad," suddenly piped up Danny, "this bag is getting awful heavy. How much corn do I need anyhow, to plant an acre?"

Daniel Dare examined this ear of corn, found it to conform to the qualifications of a good ear, and threw it into his bag.

"Better have too much than too little, my boy. A half bushel of corn on the ear would probably do, but a bushel is better. If you were picking out a good calf you would get a better one if you had several calves to choose from, wouldn't you, and the more calves the better your choice probably. Just so with this corn. Some of it might not test out so well. And then you might lose some of your seed this winter if you aren't very careful, by mice and water, you know. But I see your bag is pretty heavy and about full. Dump it at the end of the row and fill again. There's a piece of corn I want you to see especially."

So Danny dumped his bagful and with his father went over to another part of the field. "This ground is a little sandy and not quite so fertile as the rest of the field. But see those tall plants in there towering above the rest. There are several ears and not too much leaf and stalk on some of those plants. Take a few ears from those biggest plants. They have done well on poor soil and proved themselves superior to the rest."

It did not take so long to fill the second bag as the first. "Where will I keep my seed corn?" asked Danny, as he gathered the pile of seed at the end of the field into a bushel basket and filled it with what he had in his sack.

"Take it up in the attic, Dan. String the ears on some baling wire, husks and all, and hang between the rafters. I hope you'll soon find out the best way to cure your corn, but it'll be all right this way for a few days."

Success With Sheep

Up in the northernmost part of Wisconsin's dairyland, where the waves of Lake Superior lap the sands, is located, on a dairy farm, a fine family of juniors—every one of them members of the Hoard's Dairyman Juniors' Club. They are working hard, helping their parents and helping themselves. Henry Du Bay, Sr., their father, is secretary of the Bayfield County Guernsey Breeders' Association. Henry, Jr., called Harry, has assumed the duties of spokesman for this splendid group of Hoard's Dairyman Juniors. He is doing some good work managing a flock of sheep. Here is an account written for you Hoard's Dairyman Juniors by Harry:

I am 12 years old and sheep manager on Dr. Kleinhans Stock Farm.

Professor Frank Kleinheinz of the State College of Agriculture visited our farm last summer and he praised our sheep highly. He also helped us select a suitable site for our new sheep barn, which is a very good looking building 30x140 feet, with a loft for clover, also a lean-to addition containing 9 lambing pens, feed room, etc.

My duties with the sheep do not take a great deal of my time, because my father attends them when ill or lambing.

In the morning I carry them water, give them clover hay. My father feeds them their grain according to each ones' need. Sometimes we feed them a small amount of silage, not too much. A year ago we made the mistake of feeding too much silage and the crop of lambs were large, flabby, and a good many died. This year we feed less silage and the lambs are spry and active.

After I come from school I look up the sheep and count them, and if any are missing I hunt in the pasture until I find them. Sometimes 3 or 4 separate from the flock, and they seem so delighted when I find them and guide them home.

Sometimes some of the fat ewes get square on their backs near a log or something, and lay there helpless until some one rolls them over so they can get on their feet.

I help to hold the sheep while my father shears them. We get from 10 to 16 pounds from a sheep. After they are sheared we dip each sheep in disinfectant. My father says the beauty of sheep is that they need so little attention. But this I know, whoever goes in the sheep business and makes a success must learn one word of four letters, and remember it always, and always live up to it, too—and that word is C-A-R-E. *Care* in all things. *Care* makes constitution. *Care* makes carcass. *Care* is the keynote to all the sheep business.

Besides sheep, we have pure-bred Duroc-Jerseys and 16 beautiful pure-bred Guernsey cows. My brothers and I help my father milk, which is quite a chore because we milk three times a day, but we all like to milk and see who can make the best record each time. Our herd sire is a wonderful type. Dr. Kleinhans purchased him from the State Agricultural College at Madison. His name is Dairymaid's Standard of Iowa, No. 28946. We are putting an official record on all of our cows.

My father is farm manager for Dr. Kleinhans. We have lived here four years. There are seven of us. We all help father all we can. Dr. Kleinhans is good and kind to us.

A FINE FAMILY OF HOARD'S DAIRYMAN JUNIORS
Left to right: John DuBay (16), Merle (14), Harry (12), Russell (9), Helen (6), George (4), Joseph (2).

Harry DuBay is proud of this Shropshire ram, and no wonder for this animal was imported from Scotland. He is the head of a flock of 36 registered Shropshire ewes.

He is one of the best doctors in Chicago, and he does a great deal of charity work.

He started to develop this propery eight years ago. Now he has a farm of 550 acres with over 150 acres under cultivation. It is equipped with modern buildings with concrete foundations, heated and equipped with electric lights. Besides the sheep barn, the stock barn is fully equipped with drinking cups and cork brick, and everything up-to-date—36x125 foot hay room for 160 tons of hay, an implement shed 26x130 feet, chicken house 16x108 feet, and a large new hog barn, sunlight type. We have Louden equipment and King ventilation system. We have a nice nine-room house with two bathtubs and electric lights.

At school I am in the seventh grade. My two older brothers are both in High School one in first year, and the other in second. We live right on the south shore of Lake Superior. My brothers and I go swimming in Lake Superior almost every day now.

I am glad I am a junior. We think Hoard's Dairyman is the best farm paper published.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

Contagious abortion in dairy cattle is a disease which has caused nearly every dairy farmer considerable loss. Perhaps your father has had this disease in his herd. Perhaps a heifer or cow which you own has given premature birth to her calf. In the August 29th issue of Hoard's Dairyman is an article by B. T. Simms of Oregon, on the subject, "Controlling Abortion in Cattle".

Discuss the cause of contagious abortion in dairy cattle. This disease is caused by a germ called Bacillus Abortus. This germ will not grow outside of the animal body, but it will live for several months in dark damp places.

How does abortion spread? The germs are discharged by the sick cow. In experiments at the Oregon Agricultural Station the usual method for the spread of infectious abortion was found to be penning or pasturing pregnant cows or heifers with aborting cows.

Tell about the tests for contagious abortion. There are two reliable laboratory tests used to detect this disease. They are known as the (1) agglutination and, (2) the complement fixation. The first is the simpler and the one in most general use. This

test tells which animals are a source of danger.

Outline a program for the disease free herd. No successful treatment has been found to cure abortion. There are certain precautions that every dairyman can take to keep his herd free from this disease. The program worked out by experimenters at the Oregon Agricultural College includes: 1. Never add a female of breeding age to the herd until she has been tested for abortion. 2. Before adding any animal to the herd give it an antiseptic bath. 3. Do not pasture cows or heifers with untested cows or heifers. 4. Beware of stray cows. 5. Look out for the disease on the show circuit. 6. Test the herd annually for abortion.

How has the New York Experiment Station kept its herd free from tuberculosis? For the past eighteen years the herd has been free from this disease. A tuberculin test has been used at regular intervals. Previous to 1905 infected animals were removed whenever discovered and careful management of the herd since has kept it free from tuberculosis. (See article by A. C. Dahlberg).

Is sweet clover a good milk feed? Yes. Rightly handled, sweet clover makes a most satisfactory ration for economical milk production. (See W. J. Fraser's article).

Junior Letters

About a Goat Dairy

Hoard's Dairyman Juniors:—I am a little girl nine years old. I have no brothers or sisters, but several pets—an angora cat, several kids (that is the right name for baby goats). My mamma and daddy run a goat dairy. We live on a small farm ten miles from Denver near the Platte river. The soil is rich and we have plenty of water to irrigate with. The main crops around here are

DUELA WALLER AND NEPTUNE OUT FOR A MORNING SPIN

sugar beets, alfalfa, wheat, oats, corn, celery, cabbage, and other garden truck. There are many neighbors that milk cows and ship milk to Denver in a truck every morning.

We raise our own garden truck, and alfalfa to feed our Swiss milk goats, and we raise the kids so we have goats to sell every year. We have about 55 head and about thirty of them fresh. They are good milkers, most of them give from a gallon to a gallon and one-half each a day. It sells for 35c a quart in Denver.

I am learning to milk and have lots of fun playing with the kids when they are little. I help feed them and they will follow me everywhere.

Saanen milk goats give more milk for the amount of feed they eat than any other dairy animal. A good Saanen goat will give from one to two gallons a day. It takes eight goats to eat as much as one cow.

Here is a riddle: What is it that jumps like a grasshopper, cries like a baby, and runs on four legs? Ans: A little kid.

I am sending my picture with my big goat, Neptune, that I drive. I used to ride him too, but I got too heavy. I love to ride horseback.

When I am ten years old mamma is going to give me a doe kid to raise for my own.

We have one horse and about 100 White Leghorn chickens.

I like the Junior Department and always read it. My address is Eastlake, Colorado.

Duela Waller.,

Janet's Favorites—Ayrshires and Ponies

Hoard's Dairyman Juniors:—I am writing my first letter and am 11 years old. My father owns two farms. On one he sells certified milk. On this farm he owns 250 acres and on his other farm he owns 1,000 acres. He has about 225 Ayrshires. I like animals very much.

I have two ponies. They are thoroughbred Shetland ponies. One of their names is Zelda, the other is Merrylegs. I have a girl friend and she rides Merrylegs and I ride Zelda. My father bought Zelda at a fair for my brother and the next spring she had a little baby pony. When she was little she kicked somebody, so they called her Merrylegs. When my brother got too big for the ponies he gave them to me.

Last summer I went up to the farm with my father when all the heifers were out to pasture, and I saw a pretty heifer, and I asked my father if I could have her, and he said, "Yes". I showed her at the Worcester fair and got third and my father's heifers got first and second and at Springfield I got fifth and at Brockton I got fifth prize. I got $26 in all. I think I would have got more if I had shown against boys and girls, but I showed against men.

Besides that heifer I have two other Ayrshires—one is a cow, the other is a heifer. I have an Aberdeen Angus baby beef, and two police dogs, and one Wire Hair Fox Terrier puppy. Last summer I drove the hay rake for my father, and this summer he said that he would buy me a work horse for this summer so that I can drive it. You have probably seen my picture before, of the pony pulling my police dog and myself on a load of hay. It was on the cover of Hoard's Dairyman. I would very much like to have some of the juniors write to me. My address is 7 High St., Spencer, Mass.

Janet Sagendorph.

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

SMOOTH PERFORMANCE

A marked smoothness characterizes the performance of Dodge Brothers Motor Car.

In keeping with the policy of constant improvement, effective measures have been taken to minimize vibration. Applied to the body, engine, clutch, brakes, and other vital units, these refinements add immeasurably to the comfort of travel over boulevards and country roads.

The effect is so pronounced, in fact, that it is entirely fitting to classify smooth performance as one of the outstanding attributes of Dodge Brothers Motor Car.

DODGE BROTHERS DETROIT
DODGE BROTHERS MOTOR COMPANY LIMITED
WALKERVILLE, ONTARIO

Imported Melotte

with the *self-balancing* bowl. Positively cannot get out of balance therefore cannot vibrate. Can't remix cream with milk. Runs so easily, bowl spins *25 minutes* after you stop cranking unless you apply brake.

$7.50 After 30 Days FREE TRIAL

Catalog tells all—WRITE

Caution! U. S. Bulletin 201 shows that vibration of the bowl causes *cream waste!*

30 days' free trial — then, if satisfied, only $7.50 and a few easy payments — *and* — the wonderful Belgium Melotte Separator is *yours.*
